uneven, is very pleasing on account of the pretty grooves on each side, and the thick clusters of birch and maple like festoons overhanging the way. From this place the waters of the Petitcodiac find their way into Chignecto channel; while those of the Kennebecasis take an opposite direction and escape into the River St. John. This elevation seems like a barrier set up between the two streams, notwithstanding some of their ultimate branches meet each other. Sussex Vale or Pleasant Valley (names applied tothe same place by many persons) is twenty miles in length, and averages perhaps, from one to two miles in breadth. Its course is nearly southwest, and it extends from the Portage to Lyon's Inn at the mouth of the Mill Stream. The hills on each side are of grey sandstone and conglomerate which not only affords a shelter from cold winds, but reflect much heat upon the lower grounds between them. New red sandstone occupies the principlepart of the valley. This rock is, however, covered at atmany points with beds of clay, sand, and gravel.Southward there is a tract of mountainous country evidently connected with the high lands already noticed, and like them is probably composed of primary and transition formations. A large salt spring flows from thered sandstone of Sussex Vale, which notwithstanding, it has been worked on a limited scale, has supplied considerable quantities of salt. There are similar springs a few miles northward, where the saliferous rock is accompanied with beds of gypsum and limestone, extending to Butternut Ridge. It is probable that a bed of rock salt might be discovered at this place, but its 7 distance from any navigable river, would render the transportation of the article too expensive to be profitable, and therefore the springs only possess the minor advantage of supplying the country near them. Almost the whole of Sussex Vale is in a state of agricultural improvement; the uplands are excellent, and the intervale affords abundant supplies of hay. Cultivated by an industrious population, the earth sends forth her richest rewards to the intelligent and active inhabitants. Near the Church there are some beautiful spots; the winding river with its intervale, studded with elms, and the deep valley skirted with snug farms, and embraced by a chain of hills, having here and there a lofty peak - the whitened cottage - the poplar-shaded mansion; all combine to strike the eye and prove the fertility of the district. After crossing the Bridge over the Kennebecasis at Roach's farm, the hill along the north side of the road is composed of conglomerate, which extends a number of miles without being covered with other deposits. This rock may be seen well at Lyon's farm, near Millstream bridge. It is of a coarse kind and composed principally of pebbles of quartz, firmly cemented together, argillaceous matter and oxide of iron. All the pebbles have been rounded and partially polished by attrition, and from the close resemblance they bear to pebbles found in the channels of rapid streams, or on the shores of the sea, in the absence of other causes producing similar effects, there can be little doubt, they have assumed their spherical figures from being rolled by the violence or after passing along the bed of some ancient river. The present compact texture of the rock has been produced by the nature of the cement, and the pressure it has sustained. Many curious enquiries might be instituted to ascertain from whence these pebbles came, but they would be attended with difficulty, and are foreign to my present purpose. At Mill Stream bridge the valley terminates, and the hills forming its sides approximate each other so nearly, that there is only sufficient room for the Kennebecasis to pass between them. The surface of the country now becomes uneven, and although not remarkable for fertility, supports a tolerable growth of cedar and spruce. From Lyon's on the Kennebecasis to Hammond River, the conglomerate form the hills on both banks of the former. A few good farms were observed on the road, notwithstanding the soil is much inferior to the marley covering of the new red sandstone. Viewed from a hill not far from Hammond River Bridge, there is a pretty landscape, on the side of the Kennebecasis, there is a singular opening through the hill resembling a rude gateway - through this opening the farms and cottages of a small village are seen in the distance, like the 8 furniture to a house when its door is unclosed. About six miles from the city of St. John, on the road to Hammond River, the primary rocks of the chain of high land already noticed, cross the road; after having formed a series of elevated peaks, and high table land. The granite extends in a southwest direction to the Nerepis, where it is equally remarkable for its mountainous character, and sublime scenery. This formation at the spot where it is examined, is about two miles wide, but from the appearance of the mountains at a distance it evidently often extended to the distance of ten or fifteen miles in breadth. The surface above the granite near the road is low, and the turnpike has been made over boulders of that rock, these appear white from having been exposed to the weather, and fires which have occasionally overrun this portion of the country. Connected with the granite I also observed a good syenite in which the crystals of hornblende and feldspar bear very equal proportions to each other; and both rocks would supply materials for building - the Romans used syenite - both in building and architecture. Several specimens of late and epidote were procured in a fissure of that rock, which at another place was found incrustedwith the green carbonate of copper. A circumstance of much importance, and one which I hope my time on some future occasion will allow me to examine more carefully. These rocks are immediately succeeded on their south-east side by an extensive formation of primary limestone that extends in a south-west direction along the high lands northward of St. John, across the river near the Indian House, until it reaches Musquash, where it is quarried for marble. The boundaries of this most useful formation are unexplored, and but little is known of its real value and interesting minerals it contains. I have never seen limestone more highly crystallized than this, where it approaches the plutonic rocks thus mentioned. At several places where it is in contact with the granite, the marble is extremely compact, sonorous, and composed of crystals highly splendant, and white as the snow that in winter mantles the hills. Receding from the crystalline rock, the limestone becomes less and less granular and compact, until it passes by insensible shades into the transition variety, in which scarcely a solitary crystal can be perceived. These circumstances afford strong evidence in favor of the hypothesis that many older deposits of limestone have been converted into crystalline marble, by the heat applied under great pressure which accompanied the eruption of granite mountain masses from beneath. The effects then produced on the superimposed strata differ widely from those exhibited in the secondary and tertiary strata, where different chemical combinations and great pressure without the aid of volcanic agency have effected consolidation, but were incapable of producing those 9 vitreous and regular forms found in the lower rocks. It is true, that to produce crystals of carbonate of lime by artificial means, defies the skill of the chemist, but how imperfect are his manipulations, and how inadequate are his apparatus, when compared with the vast laboratory of nature, from whence whole mountains are raised in a single night, or whole continents descend into the places provided for their reception. Whatever may have been the original sources from which this limestone has been derived, it is impossible to infer that it was produced by the decomposition of older rocks, as it bears no analogy with the formations placed beneath it. Nor is it probable as some have supposed, that all calcareous strata have their common origin in the exuvia and remains of testaceous animals. It seems more rational to suppose that the lime now forming so large a portion of the earth's crust, had an origin from the hand of nature, and has only been accumulating through the medium of water or by extensive tribes of submarine creatures to which it is indispensible to form their shelly tenements. It is also necessary for the support of the vegetable kingdom, and the large quantity entering into the bones of man and other animals, naturally leads us to the conclusion that its abundance in another instance of design and wisdom of one Great Benefactor. Several varieties of marble were found in this district, some of which will vie in beauty with any ever discovered in foreign countries. Among them is a pure white with green veins, resembling the Carrara marble. At one place green serpentine was observed penetrating the calcareous rock forming the perfect Verde Antico of the Italians. Buccia marble and other varieties might be procured and may be readily distinguished even on the surface by the practiced eye. These beautiful and valuable materials for buildings and statuary, will not remain many years in their present useless state - they will soon supply the demand of foreign markets, and enter into more general use throughout the Province. The country at this place has the peculiar uneven aspect of lime districts. I wandered far from the road in the hopes of finding the entrance to some Cave, where perchance the bones of the fossil mastodon and hyena might be found in one common receptacle but disappointment followed, although such a discovery may reward the toil of a future visit. The soil, wherever the rain has permitted it to remain on the rocks, is almost sterile in consequence of being surcharged with the carbonate of lime. Those who cultivate any part of it will do well to mix it with fine sand to neutralize its caustic properties. Approaching the city of Saint John, from the eastward, the transition limestone disappears, and graywacke slate, and slate, succeed it, forming the hard and substantial basis on which the town is built. And it is singular that the capital of Nova Scotia and this its 10 rival town should repose on rocks of the same kind. At St. John, the strata also run north and southwest at some places they are almost vertical, at others they dip in opposite directions; these circumstances and the fractured state of the rocks, shew how much they have been disturbed since they were originally formed. The slate contains a considerable quantity of sulphuret of iron, and often find scales of mica, the latter giving the rock a peculiar glistening appearance. The town is built on a very uneven surface, and in order to overcome this difficulty large sums of money have been expended in making level streets, which show that its active and industrious inhabitants, amidst their commercial engagements, and various objects of enterprise, are daily rendering the city more cleanly, healthy, and comfortable, while its local situation cannot fail to render it in time one of the most important ports in America. The limestone is predominant at a village called the Indian House, situate on the River St. John, and about a mile above its entrance. This is the starting post for steam boats on the river and a kind of storehouse for the vast quantities of lumber floated down the watery turnpike of the Province. The Falls just below the village, at low water, afford a wild and sublime spectacle. The accumulated waters of the extensive and deep river, with all its lakes and tributary branches, are here dashed through a narrow opening, and over a rudely inclined plain towards the sea. Interrupted by small Islands above, and compelled to pass over huge masses of rock, obstructing a passage less than a quarter of a mile wide, the river foaming and spouting with tremendous fury, seems to assume at making its exit a most tragical character, threatening with instant death any who may venture upon its troubled bosom. But, at half-tide the scene is changed; the ocean spreads its mantle over the thundering cataract, and flowing inwards through the narrow chasm, stills the noisy rapid, and apparently to oblige the inhabitants, allows them to pass even with large ships in safety. On the east side of the falls a perpendicular wall of limestone, a hundred feet high, offers resistance to the violence of the stream, but as the current is directed on this side, it is ever crumbling down, and the river is gradually making for itself a wider and easier passage to the sea. On the opposite shore the rock is principally greywacke which makes a kind of peninsula stretching into the river and forming a considerable ""cove"" above the dangerous rapid. The ingenuity of man ever awake is about to render this local peculiarity profitable. The ""Saint John Mills and Canal Company"" have expended a large sum in opening canal across this narrow neck of land whereby they will direct a sufficient 11 quantity of water from above the falls into an expensive dam built below them and obtain immense power. The work is intended to propel twenty-four saws, and is rapidly advancing towards completion. It is the most extensive establishment of the kind in the Province, and reflects great credit on J.D. Emery, Esquire, the Agent, and the Engineer, who are engaged in its construction. From the falls to Grand Bay, four miles distant, the river passes through a deep narrow and tortuous channel, opened through hills of marble and transition limestone. I was surprised to observe that the continued action of the current, frost, drifting ice and timber has produced so little effect in forming sloping banks upon its sides, which are scarcely indented, but dip in straight lines beneath the water. When the absence of these effects, the narrow and remarkable outlet of the river, with its foaming cascade are considered, it appears probable that this site is by no means the original outlet of the Saint John, but one which has been reproduced from some geological catastrophe of which the rocks themselves bear the most unequivocal testimony. From what has already been observed I am induced to believe that the waters of this extensive river now escape into the ocean through an unnatural channel, and that its former bed was filled up by the same change in the level of the country that opened the new and extraordinary fissure through which it now passes. And I doubt not the ancient mouth of the St. John may still be discovered, and a subject so interesting be clearly elucidated by substantial facts. I

N.B. Courier - Sep. 30, 1837 LETTER III. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: Resuming the subject of my last letter, and the route from Petitcodiac River along the main road to Saint John,I found the road after leaving Holstead's Inn, to pass over a considerable hill called the Portage. The rocks of this hill are sandstone of the coal measures; and among them fossil Cacta Calamide and impressions of leaves are visible where the strata appear at the surface, which in general is covered with a meagre soil. The Portage is four miles long, and although narrow and uneven, is very pleasing on account of the pretty grooves on each side, and the thick clusters of birch and maple like festoons overhanging the way. From this place the waters of the Petitcodiac find their way into Chignecto channel; while those of the Kennebecasis take an opposite direction and escape into the River St. John. This elevation seems like a barrier set up between the two streams, notwithstanding some of their ultimate branches meet each other. Sussex Vale or Pleasant Valley (names applied tothe same place by many persons) is twenty miles in length, and averages perhaps, from one to two miles in breadth. Its course is nearly southwest, and it extends from the Portage to Lyon's Inn at the mouth of the Mill Stream. The hills on each side are of grey sandstone and conglomerate which not only affords a shelter from cold winds, but reflect much heat upon the lower grounds between them. New red sandstone occupies the principlepart of the valley. This rock is, however, covered at atmany points with beds of clay, sand, and gravel.Southward there is a tract of mountainous country evidently connected with the high lands already noticed, and like them is probably composed of primary and transition formations. A large salt spring flows from thered sandstone of Sussex Vale, which notwithstanding, it has been worked on a limited scale, has supplied considerable quantities of salt. There are similar springs a few miles northward, where the saliferous rock is accompanied with beds of gypsum and limestone, extending to Butternut Ridge. It is probable that a bed of rock salt might be discovered at this place, but its 7 distance from any navigable river, would render the transportation of the article too expensive to be profitable, and therefore the springs only possess the minor advantage of supplying the country near them. Almost the whole of Sussex Vale is in a state of agricultural improvement; the uplands are excellent, and the intervale affords abundant supplies of hay. Moncton Daily Transcript - Apr. 11, 1890 District Geology. - Mr. Chalmer's Work in Westmorland and Adjoining Counties. - The latest report of the Department of the Interior states that Mr. Chalmers, of the Geological Survey, was engaged during the summer in studying the superficial deposits of southern New Brunswick, including the counties of Kings, Albert and Westmorland. The survey of the surface geology of this area is now completed, at least so far as the nature of the country will admit of such being done in detail. Considerable portions are still unsettled and in a wilderness state, and in these of course, the study andmapping of the surface deposits could only be done in avery general way. Maps and reports with reference to thisdistrict are being prepared. Mr. Chalmers further reportsas follows: The glaciation of the eastern part of the area in which lies the north eastern extension of the ridge or plateau bordering the Bay of Fundy, was investigated with some care, and facts of much interest discovered. This ridge forms a prominent feature in the landscape, being higher than any other part of the country except the northwestern highlands or the Gaspe Peninsula. Here, therefore, we might naturally expect to find traces of a continental glacier, if such ever swept over the eastern part of New Brunswick. None were observed, however; on the contrary, great masses of decayed rock in situ encumber its northern and northwestern flanks, while along the valleys of rivers descending from it northwardly into the Petitcodiac striae were found clearly indicating northerly ice movements. Along the Petitcodiac valley, however, which lies below the 200 feet contour line striae were seen to follow its course, showing ice movements in an easterly direction. It is evident that local glaciers and icebergs were amply sufficient to produce all these phenomena. On the summit of the Bay of Fundy ridge or plateau referred to, local areas which served as gathering grounds for glaciers sent some of these off towards the Bay of Fundy. A large number of facts relating to the glaciation of this district will be given in the annual report. District Mineral Resources. - In the enumeration of the mineral resources of this section, Mr. Chalmer's report says that brine springs are found at Sussex, at Salina, on Salt Springs Creek, and at Bennet's Brook, near Petitcodiac. At Bennett's Brook nothing has been done to utilize the springs there, to his knowledge. In all these places the brine contains a considerable percentage of sulphate of lime or gypsum. There appears to be less, however, in that of the Sussex springs than at Salina or Bennett's Brook. Medicinal springs are met with at Apohaqui and at Havelock Corner, Kings Co. The Havelock mineral water has, for some years, held a local reputation as a remedy for certain diseases; and as an extensive deposit of mud surrounds the spring, it might be utilized for the establishment of mud baths, which are said to be beneficial in the treatment of some diseases. Infusorial earth has been reported at Pollett River, Kings Co. Subsidence of the marshes. - Mr. Chalmers further says: I visited the Ship Railway now under construction across the Isthmus of Chignecto. In an excavation which is being made for the docks in the salt marsh at its western end, the following series of deposits is disclosed;- (1) marsh mud, 5 to 10 feet; (2) fine grained, stratified blue clay, holding numerous shells - thickness, from a few inches at one end to five to eight feet at the other; (3) peat or humus, six to fifteen feet thick, containing roots and stumps of small trees, chiefly haematae, and in some places portions of the stems. This peat or forest bed evidently grew on a sloping bank at the border of a lagoon or quiet inlet. The lowest part of it is now twenty feet or upwards below the level of high tides in the Bay of Fundy. At Aulac station, Intercolonial Railway, which is on the great Tantramar salt marsh, a boring 305 feet deep, was put down under the direction of P.S. Archibald, chief engineer, Intercolonial Railway. This boring shows likewise (1) marsh mud, eighty feet; (2) turf and bog; (3) red clay, &c. These facts clearly establish the conclusion that a subsidence has taken place here since the growth of the peat beds, and confirm the

Evening Gazette - Aug. 14, 1889 and Daily Telegraph - Aug. 16, 1889 A New Brunswick Industry. - (Bangor Commercial) - Hon. David McLellan, one of the most prominent gentlemen in New Brunswick was in the city today on a flying visit. He came through to Orono on a business trip of a somewhat peculiar nature. It seems that Mr. McLellan is one of the leading members of a large company which has been formed to take the moss from a great bog near Musquash Station, N.B., and ship for commercial purposes. The scheme originated some time ago and the moss has already been used to quite an extent for bedding and other purposes. It is eleven feet deep in the bog and one of its peculiarities are that it will absorb 100 per cent of water or far more than a sponge. Of course it has to be thoroughly dried before it can be shipped and one of its peculiar properties is that when it is dry it will not burn. Quite a business has already sprung up bringing the moss litter from Germany into New York and the Province men propose to compete with them. They have a great demand for the product and Mr. McLellan says that if they had 10,000 tons of the moss ready for shipment they could dispose of it at $10 per ton. He came to Orono to look at the sawdust press at F.W. Ayer & Co.'s mill and they intend to purchase some of the presses of the Maine Compress company to use in their moss bailing business. The recent bonanza found at the bottom of an Eastern Maine pond and this big enterprise show that the seemingly useless parts of this great eastern country can all be utilized."

Daily Sun - Jan. 10, 1899 Peat Moss. - Alderbrook Farm, St. John, N.B., Jan.9 Col. Alfred Markham, Manager Sun Printing Co.: Dear Sir - I have a peat moss bog on my farm of about 50 acres in extent. I understand such bogs are quite common in the northern half of North America, so my experience may be of interest to a number of your readers. These bogs are usually called barrens. I think one dollar spent on mine will bring more and better crops than tenon any other land in its natural state that I have. The bog seems to have a saucer-shaped white clay bottom; on the surface each year grows moss in small hummocks; below is the moss that is so well known as German moss litter, a grand deodorizer, wonderful absorbent, that contains as much nitrogen, ton for ton, it is claimed, as the best stable manure. The bedding moss runs from an inch deep at the outside to a depth of 12 to 15 feet towards the centre of the bog; between it and the clay is the black rotted moss or peat. Last May I mowed the blueberry bushes by hand, tore the hummocks of living moss off with a spring tooth cultivator, going over it twice to get a smooth surface, and took the loose moss to the barn for bedding. Then with a simple tool, I cut out drains 22 inches apart, and put the moss from them away, after drying it on a rock shaped like a turtle's back, for this winter's bedding. I had eight lands, 300 feet long by 21 feet wide. I dressed them all with refuse lime fresh from the kiln, and some with manure as well. The lands with lime gave but a poor crop, but with lime and manure I had as good a crop of oats and peas, buckwheat, grass and clover as I have ever seen. All I put in during May I cut green; some I put in on the 16th of June matured timothy seed with a 30 inch stalk and a 2« inch head. Mature timothy in a little over three months beats all records I have ever heard of in this locality. My bog never overflowed, even before I put a main drain into its borders some four years ago; so I do not know that it needs small drains at all. I have put up a land 120 feet wide this fall, and if it works well I do not expect to bother with any more than three or four large drains (that can be dammed in the dry time of summer) in the whole 50 acres. I seeded down an experimental plot in September with eight kinds of winter wheat, four kinds of rye, three of oats and one of vetches. They are now under the snow looking well. In the Country Gentleman of Nov. 17th (page 905) a correspondent tells of feeding peat meal. I would like to hear further of this, as I have thought the top moss has a food value. When I add that the peat is now made into a fuel the equal of coal by a machine invented by an Upper Canadian, I think you will agree with me that the name Barren, as applied on those moss bogs, is a misnomer. I expect to push my experiment of growing a higher on a lower form of vegetable life this coming summer, and would like your advice, particularly with regard to drainage and manures, or how best to grow crops on a peat moss bog. Very truly yours, Ernest H. Turnbull."

N.B. Courier - Nov. 18, 1837 LETTER VII. To His Excellency Major General SirJohn Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: In closing the communications I have had the honor of laying before your Excellency, I beg that I may be permitted to introduce some information obtained by others whom I had the pleasure to accompany on an excursion across the country towards Richibucto; and although the facts there collected are not wholly of a geological nature, their relation may not prove altogether useless and uninteresting to such as feel an interest in the welfare of the country. Our party consisted of Captain Egerton, Mr. Levinge, and the Hon. Mr. Cholmondeley, of the 43rd Light Infantry, M.H. Perley, Esquire, and myself, with five Indians hired for the purpose; namely, John St. Baptiste, Lewis Paul, Martin Paul, Sacobee Ottowin, and Joe Lola, each with a light bark canoe. Our departure was 7 taken from St. John on the 16th of August, and we arrived at the head of Grand Lake, in the Woodstock, steamer, in the evening of the same day. The party, excepting myself, was abundantly supplied with the instruments of death, and much time was spent in examining fishing tackle, salmon spears, fowling pieces, rifles, &c., which, when arranged along the deck, gave the boat a very warlike appearance. A large leather bag, pickaxe, and hammer, were insignificant objects beside the polished steel of my companions in arms, and among the often repeated sounds of bears, moose, cariboo, salmon and trout, the desire of finding a gold mine was seldom mentioned. Had the beasts of the forest and the fish of the Richibucto, have beheld this dreadful array, or known the determined resolutions for their destruction, they would have forsaken their native haunts, and fled from before their approaching foes. And such seems to have been the fact, for few of either tribe suffered by our advance upon them. The following day we embarked in our canoes, and proceeded eleven miles up the Salmon River, to a place called the Forks. In this distance the sandstones of the coal measures are the only rocks to be seen. There is a singular mound of fine sand thrown up on the south side f the river. Its elevation above the general level of the country gives it the appearance of an ancient fortification; but no relics were discovered to explain its history. The whole surface of the country around this place is not more than fifteen feet above the level of the lake, and viewed from the highest eminence appears like an extensive prairie, covered with a dense forest of spruce. The river flows along a crooked bed, skirted with rich intervale, and studded with majestic elms, whose broad shadows on the water were truly delightful as we paddled beneath the long umbrella spread over the way. Thus far the Salmon River is deep and tranquil, and not more than a hundred and fifty yards wide, abounding in lilies which were so numerous in some places as to resist the progress of our frail barks. Having ascended a considerable rapid above the Forks at the close of day, we landed, and the Indians in half an hour, erected a camp large enough to give longitudinal accommodation to ten persons. After a hasty supper torches were prepared, and all hands equipped for spearing salmon. In the darkness of midnight, our Nautilus fleet was launched, each canoe with a flaming torch hoisted at its prow. The long handles of the spears served to force the barks up the foaming rapids, into which the adventurer should always be prepared to slide, for altho' he may understand the art of balancing, and the laws of gravitation erfectly, an Indian canoe will sometimes demonstrate a new problem, and plunge him head-foremost into the stream. The river illuminated with brilliant lights, darting from side to side of its banks, and flashing upon 8 the polished steel, afforded a truly savage spectacle, while the hopes of striking a fish, and the expectation of being every instant compelled to dive, produced a little nervousness even in the Indians themselves. For this kind of amusement we were abundantly prepared, and it was conducted in true native style, only one thing was waiting to render it complete - but one salmon could be found. On the morning of the 18th, we parted with Messrs. Cholmondeley and Levinge, who entered the forest on the west side of the river, with old Sacobee, and Joe Lola, in quest of cariboo. They were several days in the woods without meeting with any game, and they returned with the solitary pleasure of having attacked and fairly beaten a large she bear and several cubs. Some fear had been expressed that these gentlemen would not endure the hardships of such a journey, but they returned in excellent health, having been much gnawed and stung by flies and musquitoes. With our lessened numbers and baggage, we then made a portage across the mill dam of John McAllister, Esq. Here the sandstone is exposed, and its strata may be seen having a gentle inclination to the northeast. Six miles farther up the river we landed to examine a mineral spring near a small collection of sand called Cast Away Island. The water of the spring flows from the coal measures, and will fill a hogshead every fifteen minutes. It has a very unpleasant odor and taste, and having been reported to be medicinal, a quantity wasafterwards brought away and analysed. The Indians seemed to think it poisonous, as they could not be prevailed upon to drink any quantity. I drank a pint from the fountain, and discovered that the water was gently sperient. By analysis it was found to contain in sixteen fluid ounces, Carbonic acid, Sulphuretted Hydrogen, Sulphate of Magnesia, grains, 4 Sulphate of Soda, grains 19.5 Oxide of iron, grains 4 It therefore differs but little from the sulphurous spring of Cheltenham, and will be found very efficaceous in cutaneous eruptions, and a variety of other disorders. The above analysis may not be found strictly correct as the salts in the water might have entered into new condunations before I had the opportunity of applying the proper tests for their discovery. Ascending the stream the interval diminishes, and the river runs along a smooth channel worn out of the sandstone; wherever the soil is sandy there are groves of pine and numerous wild flowers - the rose and the honeysuckle were seen blooming on the side of the unfrequented stream. A black dragon fly was found here differing from any I had seen, and other species are remarkable for the beauty of their colors. Several miles 9 above the Springs, a bed of the yellow oxide of iron was discovered - it would yield an abundance of ochre forpigments. From the increasing shallowness of the water, and violence of the rapids, our progress was greatly impeded, and we halted in a grove of pines for the night. We required not the skill of a French cook to prepare our supper, when the appetite is sharpened by labor, and abstinence, even the hasty preparation of the Indian is received without any scrupulous enquiry respecting its absolute cleanliness. With our heads under our canoes and our feet opposite a great fire, we would have slept; but myriads of musquitoes trying to find soundings on our faces, rendered the labor of the night greater than that of the day. Several kinds of ointment were tried in vain, and it was impossible to wind a blanket around the head so tight as to admit of respiration, and keep the winged insects off. The natives suffered equally with ourselves, and nothing but a suffocating smoke had any effect upon these flying and singing armies. At sunrise next morning we again embarked and commenced scaling the stream with renewed vigor. Nothing can exceed the stillness and gloom presiding over the water between the rapids, which are often three miles apart. The sound of the bugle is delightfully re-echoed in the windings of the river, and often did our red brethren beg for a tune on the pee pee-quat. - The course of the stream is about northeast, and forty miles from Grand Lake it will average thirty yards in width. There is a sameness in the scenery that foils the memory and sets description at defiance. As far as vision extends, in every direction the surface presents one vast level tract, in many places occupied with groves of pines and towering hemlocks. Not a rock can be found, but such as belong to the coal series; these, when there are depressions in the strata, are covered with beds of sand and clay; of the latter there are collections of different colours, and such as are well adapted for the manufacture of the finest porcelain. One particular spotwas pointed out by old John, our guide, as favorite resort of the cariboo, and the natives have a tradition that that animal has long frequented this particular place to obtain something from the earth - probably asmall quantity of salt. The alcedo or kingfisher, only observed occasionally in any climate, is common on the Salmon River, and was seen constantly plunging into the water, and destroying great numbers of small fish. This bird was the halcyon of the ancients, who in the age of fable ascribed to it remarkable powers. Aristotle and Pliny have said that during the time of its sitting the mariner might pursue his voyage in safety, hence those days were called the halcyon days. Two kinds of the smallest wading birds, were seen upon the shores, and on the plains the 10 pigeons are numerous during the season of incubation, and when the whortleberry is ripe. The following remarks have been extracted from the Journal of Mr. Perley, who with Capt. Egerton, pursued the route to a greater distance than my time would allow. He says, ""the borders of the upper part of the Salmon River were found to consist of low land, with much meadow covered with alder. Below the 'Oxbow', where the river bends off very suddenly to the southward, we passed a number of short angles. Above, the water became deeper, and more placid. The river is here about thirty yards wide, and many tall pines on its banks, fling their broad shadows upon the deeply colored waters. Before arriving at the portage we noticed several extensive beds of clay, and red, and yellow ochre, on the sides of the river; but no stone of any description. At 5 p.m. we made up our packs, in a violent thunder storm attended with rain, and set out over the most dreary tract of country we ever beheld. The land between the Salmon River and Richibucto is very swampy and has been burnt over not many years since. The ground is completely covered with windfalls of all sizes, so that the portage path was blocked up. In three hours we had advanced only two miles, when we reached a thicket of green wood and encamped for the night, under torrents of rain. The Indians exerted themselves with great spirit, and notwithstanding all our clothes and blankets had been wet, since they were turned into the river by the upsetting of a canoe, and the rain had again given them another ablution, we slept soundly before the blazing fire. The bright sun of the next morning awoke us, and having cleaned our guns, and breakfasted, we followed a tolerable path to the distance of a mile, when we arrived at the head of the Richibucto. This river at the place where we first floated upon it, is about ten yards wide, having a gravelly bottom, clear water, and an abundance of small yellow trout, quite different from those taken from the water flowing into the St. John. The stream runs through an alder meadow, and groves of pine, spruce and elms, are seen only in the distance. At 2 p.m. the Indians returned from Salmon River with the canoes, and a more laborious task could not have been performed by men. After our embarkation the water was so shallow and the rapids so frequent, that our progress was slow, and at night we halted only six miles below the portage; in this distance the forest is composed of pine and fir, almost exclusively. The night being fine, we slept under the shadow of our canoes. Advancing down the river on the following day, the banks were carefully examined, but no rock could be found except the grey sandstone, identical with that of the Salmon River. Near Smith's Mill we opened a pretty settlement, the first we had seen on this side of the portage; the canoes and baggage were carried around the dam, which is one mile from the head of the 11 tide, and twenty six miles from the town of Richibucto. We here spent a large portion of the day in fishing, and I never met with a spot so well deserving the visit of the angler. In four hours we killed two hundred splendid sea trout, many of which were of 2 and 3 lbs. weight. These fish are shorter and thicker than the lake trout, and have a much brighter and more silvery hue. They are also stronger and when rising at the fly almost always throw themselves entirely out of the water, and seldom miss being hooked. With the ebb tide we dropped down the river, which gradually becomes wider, and runs between horizontal layers of sandstone. The soil (evidently the debris of the underlying rocks), is light and sandy. There are here many promising farms, and the fine fields of grain were strongly contrasted with the desert we had passed through. Below the mouth of the South, or Mill branch, the Richibucto opens into a wide handsome river - or what might be more properly called an arm of the sea; passing down, we noticed that the banks are composed of grey sandstone, passing into red, all laying into horizontal strata. Those rocks form a number of cliffs, in which the sea has worn numerous holes, and caverns, exhibiting a great variety of fanciful shapes and figures. We encamped below the Molus River, and the following day reached Richibucto, where, notwithstanding the forbidding appearance of our soiled Indian dresses, we enjoyed the kind of hospitality of W.J. Layton, Esquire, and other respectable gentlemen."" As I have already far exceeded the limits originally intended for these letters; I regret that I am unable to detail all the useful and interesting information gained by the indefatiguable exertions of Mr. Perley, on his return from the North Shore of the Province; and therefore I hope he will give a more elaborate account of it from his own pen. That gentleman and Captain Egerton were fifteen days on the tour; they encamped in the woods twelve nights, and were exposed to some very unpleasant weather, which, however, did not prevent them from returning home in perfect health, and in good spirits. The Indians also endured their hardships without a murmur, and were delighted with a tour so congenial to their natural habits. They are very intelligent, but less athletic than the Micmacs of Nova Scotia; their dialect differs much in some particulars, although these different tribes can generally understand each other. The Micmac of Nova Scotia calls a canoe Talactic - the Milicete of New Brunswick applies to it the word Pa-que-dan. The following are a few nouns of the latter race: Pessqua-haut Axe .... Tom-a-ha-gom Knife .... Me-go-da-nis Salmon spear .. Neck-an-gull 12 Tea kettle .... Check-lock-qe-gun Indian purse .. Patch-nau-goe Bugle .... Pee-pee-quat Paddle .... Ta-han-gen RIVERS Loosh-tork, } (The St. John) } the long river Magaguadavic the river of hills Oromocto the deep river Nashwaak the rapid river Nashwaak-sis the little river of rapids (sis being the Indian dimunitive) Richibucto the river of fire, or river of the burnt country Miramichi the happy retreat Restigouche the ..?.. river Pokiock the frightful river A lake is called quis-pam - a river, seep - brook, seep boo-sis. A doctor is denominated noo-chein-peel-wot. I observed that they called me noo-chein peel-wot pe-nops. Penops signifies stone, hence they implied a stone hunting doctor. Before I take leave of your Excellency, I beg to remark that the letters now concluded, have been prepared for the Press, amidst other and constant employment. A few typographical errors could not be corrected, in consequence of my distant residence from the publisher. Of the importance of obtaining an accurate Geological knowledge, and unfolding the mineral wealth of the Province, it is unnecessary for me to advance a single argument. My only object has been to render my favorite pursuits as useful to mankind as possible, and with the least degree of success I am satisfied. The kindness I received from all classes of the inhabitants during my visit among them claims my warmest acknowledgements. I am much indebted for the kind permission received, to address these letters to Your Excellency, and sincerely hope they prove interesting to one whom the loyal sons of the British Colonies in America justly delight to honor, and whose elevated character needs no encomium beyond the affections of the people. I have the honor to be Your Excellency's most obedient and humble Servant, A. Gesner. Parrsboro, Nova Scotia, } Oct. 17th, 1837 }"

Royal Gazette - Nov. 12, 1842 We draw attention to the extracts from two Reports of Doctor Gesner on the Tobique and RestigoucheRivers, which he was deputed to explore, with a view to ascertain the capabilities of lands for settlement. To His Excellency Sir William MacBean George Colebrooke, K.H., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency, I beg leave to lay before Your Excellency a brief report on the explorations of the Tobique River. A more particular account of which will be contained in the report on the settlement lands. The Tobique River is the largest tributary of the St. John, excepting the Restcook, to which it is very nearly equal. Its mouth is twenty miles below the Grand Falls, and two miles below the confluence of the Restook with the main stream. The main Tobique extends to the northeast, and about a hundred miles from its mouth by the courses of the River, it is divided or forked into four branches. One of these branches enters from the southeast, and is supplied with water by three lakes, the largest of which is twelve miles in length. These lakes are situated at the chief sources of the main northwest Miramichi. The Indian portage between the St. John and Miramichi waters is only one mile in length. The other branches of the Tobique extend northward and meet the heads of the Nepisiguit and Upsalquitch, whose waters descend in an opposite direction to the Bay Chaleur. The Tobique, Miramichi, Nepisiguit and Upsalquitch Rivers, all take their rise in one district, and at the bases of the highest mountains in New Brunswick. Extending across the State of Maine in a northeasterly direction, there is a chain of high lands, occasionally elevated into mountains of considerable altitude. This branch is a part of the Allegheny chain, and embraces Cataadan and other mountains in the State of Maine. After entering New Brunswick, this branch sends up Mars Hill, Moose Mountain, and Bear Mountain, on the St. John, between Woodstock and the Grand Falls. The same range extends in a northeast direction to the heads of the before mentioned rivers, where some of the mountains exceed two thousand feet in height. This mountainous district gradually subsides as it approaches the Bay Chaleur, and the north coast of the Province is remarkably level. Another alpine ridge extends through the middle of the District of Gaspe, and separates the waters that flow into the St. Lawrence from those that fall into the Bay of Chaleur, and River St. John. The Tobique, Nepisiguit, and Upsalquitch, all take their rise in the broken and mountainous termination of the New Brunswick range; and after descending from fall to fall, they sweep through the vallies and receive the tributaries of the lower grounds, until they are lost in the larger streams into which they open. As the Tobique River and its tributaries are uninhabited, a sufficient stock of provisions was procured, and three Indians, with as many light bark canoes were hired for the expedition. Accompanied by my son, and Mr. James Millidge, the ascent of the river was commenced. We started from Fredericton on the 27th of June, and reached the mouth of the Tobique with the canoes, instruments and baggage, on the 3d of July. At the entrance to the river there is a considerable tract of intervale, which with several thousand acres of excellent upland belongs to the Melicete Indians. There is here an Indian village containing two hundred souls, and as this place is a depot for Timber, upwards of three hundred men were employed in preparing rafts of Timber to descend the main stream. As these Indians scarcely cultivate their lands, and their grant occupies a most important situation, it would be advantageous if some exchange could be made, whereby they would possess equal if not greater privileges. I am confident that if these valuable lands could be obtained by other inhabitants of the country, they would be immediately settled, and a flourishing town would soon be built upon the grounds now unprofitably occupied by the Aborigines. During the rafting of the Timber, many of the Indians are employed; but their chief occupation is hunting and fishing. We observed among them a quantity of Fur, taken from Ambrose Bear and his brother, valued at œ150, among it were eighty Beaver skins, and about thirty pounds of Castor. About a mile above the Indian Village there is a dangerous rapid called the Narrows. At this place the River to the distance of a mile passes through a gorge only one hundred and fifty feet wide, and between cliffs from fifty to one hundred and fifty in height. It is evident that at some former period there has been a great fall at this place, and their evidences that the barrier to the water has been broken, and the River above gradually lowered. The water rushes through the gorge with great violence, and the projecting masses of rock produce dangerous rapids. During the freshets of Spring and Autumn, this channel is too narrow to give vent to the river; and the water from being thus partially dammed up, overflows the shores above to the distance of two miles. At such periods boats and canoes cannot pass; and such was the violence of the rapids in July, that we were compelled to draw our canoes up with tow-lines. The navigation of the River at this place, might be rendered safe and easy, by the erection of dams and locks; there is here an excellent site for Mills which might be set up, without much injury to the salmon fishery. From the mouth of the river to the Red Rapids, a distance of twelve miles, there is some good intervale, the lands are high and the soil productive. Several squatters have settled on the banks of the stream. The Tobique Mill Company built a dam across the river, and erected extensive saw mills in 1837, but before these mills were put in operation, a part of the dam was carried away. The Mills have since been taken down with the intention of moving them to the Narrows below. œ27,000 were expended by the company at this place. Three millions of logs that had been cut, have also been lost in the speculation. The establishment is now a deserted village. If a dam should be built across this stream, a free passage for salmon and other kinds of fish should be secured, as there is scarcely a better river fishery in the Province. Our third encampment was at Plaster Island about twenty five miles from the St. John, and two miles above the mouth of the stream called by the lumbermen Wapske or Wapskehegan. Between the island and the Red Rapids, the Otelloch, Otella, three brooks, and other smaller rivulets enter the Tobique. The main River here is extremely beautiful, being decorated by numerous small islands and belts of intervale, covered with elms, balsamic poplars, and other trees characteristic of a most fertile soil. The Wapskehegan is a large stream coming in from the eastward. At its sources it approaches very nearly a branch of the Miramichi, and it runs through a fine tract of intervale and excellent upland. A mile below the Red Rapids, the calcareous shales of the St. John are overlaid by a bright red sandstone, a rock that always indicates a good soil. This sandstone occupies a large tract in this quarter, and extends up the River to the base of Blue Mountain, twenty miles farther northward. At Plaster Island, on the banks of theWapskehegan, and so far as we could discover in a district of several thousand acres, there is an abundance of excellent gypsum. At the Island on the left bank of the Tobique, the gypsum occurs interstratified with the red sandstone in a cliff 135 feet high. It is of the fibrous and compact varieties, and some of the strata are of a bright red color. This gypsum may be transported from the Wapskehegan down a branch of the southwest Miramichi, and supply the country in that quarter, as well as the valley of the St. John, with excellent mineral manure. A short distance above the head of the island,there is a small brook of brackish water, it proceedsfrom a salt spring, a mile and a half from the river. There are also other indications of rock salt in this quarter.About a mile farther up the stream I discovered an immense ridge of limestone, at the side of the River. This limestone is stalactital like that found in the interior of caves. Apparently the river at this place, has broken into a cave of considerable magnitude, and stalactites are scattered along the shore. From the deep fissures and chasms concealed beneath the fallen trees and other vegetable rubbish, it is dangerous to walk over this rock; there are many good reasons for believing that the earth is cavernous at this place. Above Plaster Island the river becomes very serpentine, and where the intervale is absent, the banks on each side are from fifty to a hundred feet high. About twelve miles above the mouth of the Wapskehegan, another large stream called the Agulquac, enters from the eastward; this stream also passes through a fine tract of country. A large area here was overrun with fire a few years ago. It is probable that this was the same conflagration that destroyed the towns and villages of Miramichi, in October, 1825, but as there are no inhabitants in this quarter, the exact period of its occurrence has not been ascertained. From the mouth of the Agulquac to the base of Blue Mountain, is about eleven miles, the River here is eighty yards wide, and is skirted with fine tracts of intervale. There are also numerous alluvial islands covered with lofty and thick foliage. At the foot of the Mountain the red sandstone reposes on the transition slates. The whole country from this mountain is comparatively level; but from this point northward, it assumes new features and becomes more elevated. About eighty miles from the mouth of the Tobique, the river divides into four branches. The Little Tobique, Mamozekee, and Right Hand Branch, extend to the source of the Nepisiguit, and wind their way among naked and almost inaccessible mountains of granite and trap rock. Bald Mountain is 2,240 feet high, and is surrounded by several lofty peaks, but little inferior in altitude. It was my intention to have visited all these mountains, but the streams had become too dry for our canoes, one of our Indians had deserted, and the two that remained, refused to proceed any further into the wilderness. Our provisions were reduced almost to the choice of fish caught in the stream, and our faces and limbs were swollen and painful from the innocent stings of the insects in the forest. The whole surface of the country in the direction of the Tobique River, from its mouth to the distance of eighty miles northward, is capable of the highest degree of cultivation. The soil in general is equal to, and often surpasses the best kinds I have seen in the Provinces. I had supposed, from the accounts received from persons who had been engaged in procuring timber up the stream, that there were many places where the soil was unfit for cultivation; but such an opinion has arisen from the dreary appearance of the surface, where it has been overrun with fires. In every quarter we found a deep, rich, and strong soil. Formerly there were immense groves of white and red pine in the vicinity of this stream, but most of these have been removed or destroyed by fires. At present there is comparatively but a small quantity of pine, spruce, cedar and sometimes beech, birch and maple. Along the whole course of the stream, there are tracts of the best quality of intervale, covered with elm and balsamic poplar, ash, alder, &c. Wild hay is abundant. Besides these, we found indigenous grape, wild plums, currents, gooseberries, mint, rhubarb, and onions, with all those plants which only flourish on the richest soils. In descending the river, I counted seventy islands, all composed of alluviums. The limestone, gypsum, and salt, are very valuable in this part of the Province, and they are so situated that they may be transported over a wide extent of Country at a trifling expense. The river abounds in salmon during the season, and there is always an abundant supply of trout and whitefish in its waters. John Cahile, who lives near the mouth of the river, killed twelve barrels of salmon with a single spear last season; they were sold for œ5 per barrel. The river is navigable for canoes and tow-boats about one hundred miles from its mouth. There is only a portage of two miles between its head waters, and the Nepisiguit, and one of three miles to the Upsalquitch. The lands upon the Tobique remain ungranted. Under a due consideration of all the advantages offered by the river and for the soil of the intervales and uplands, I am fully of the opinion that this tract of country, which embraces several millions of acres, is better adapted to the circumstances of respectable Emigrants and other settlers, than any other district I have seen in New Brunswick or Nova Scotia. Much confusion has arisen in the names of places within the Province from the careless manner in which these names have been written and spoken. A great number of rivers and lakes still retain in some degree, the ancient names of the Melicete and Micmac Indians; but those names in many instances have been changed or corrupted ao that they are not now understood by the Aborigine themselves; and they are seldom written in the same manner by the inhabitants of the Province. Other names are those of the early French settlers; these also have become imperfect, and even English names are sometimes written improperly on Maps or other public documents. I have taken the liberty to insert the names of places on the Tobique, as used by the inhabitants, and opposite to them the Indian names. Tobique Naa-cootke, Otelloch Hotelle, Otella Na-me-taaps-k-waac-sis, Mamozekel Epe-ce-tus-sis, Right Hand Branch Qua-quaps, Serpentine River Wa-ca-souis, Lake Quispaam, Trowsers Lake Nee-taa-waac-paac, Sisson Branch Wa-caa-so-nee, Little Tobique Caac-seo-sic-ka-wa-ic, Bald Mountain Es-coot-naak-a-witz, Three Brooks Naa-saa-taa-gan. The present brief report has been drawn from extensive notes taken during my exploration of the Tobique, and I sincerely hope that it will prove

Codes: M4 / IDX_Names: Mushquash Peat;
Moncton Daily Transcript - Jun. 7, 1888 An American Syndicate, of which Mr. G.T. Bennet, of Jackson, Michigan, is the principal, has purchased a tract of land, composing the Musquash Barren, near St. John, for the purpose of raising peat moss, an excellent article extensively used in the United States for bedding cattle and horses. The locating of the necessary works for drying, pressing and shipping will be commenced at once."

Codes: M4 / IDX_Names: Mushquash Peat;
Saturday Gazette - Jun. 9, 1888 The importance of good memory is shown in the discovery of peat moss at Musquash. Some years ago Mr. Wallace one of the discoverers of the moss, while fishing in the locality found that fish packed in moss from the big barren kept fresh longer than if packed in other kinds of moss. Years afterwards when in his business of farming he used peat moss from Germany, he found that it resembled the moss he used to find at Musquash. Mr. G. Clowes Carman visited his farm in New Jersey, and when shown the peat moss confirmed Mr. Wallace's opinion as to the nature of the moss at the big barren. The purchase of the land was at once decided upon, and the assistance of a wealthy gentleman of the west, Mr. T.G. Bennet, of Jackson, Mich., enlisted to promote the scheme and develop the property. The company is comprised of men who will push the enterprise forward as rapidly as possible. A large sum of money has already been expended, and a much larger sum will be put out during the summer. Immediately on completing the title to the property, a corps of men under the direction of Mr. Carman started to survey and make a road through the property. This road will be completed next week, when the building of a factory will be decided on. It will take a month to complete the buildings and set up the machinery. The work of building finished, two crews of men, one working by day, and the other by night will be put to work, and as much moss as possible will be dug and prepared for shipment before the ground freezes up. The find is a very valuable one, and the employment that will be furnished will be of great benefit to the inhabitants of the western end of the county. Lounger"

S.J. Daily Sun - Nov. 6, 1888 Peat Moss. - The Wealth of the Big Musquash Barren. - In June last the Sun published the fact that the big barren at Musquash has been purchased for the purpose of developing the deposit of peat moss recently discovered there. During the intervening time the purchasers have expended a considerable sum of money in developing the property, erecting buildings and building roads. The property at Musquash contains 450 acres, 300 of which compose a deposit of peat moss varying from ten to thirty feet in depth. About 50 acres has peat moss to a depth of from three to five feet, but so grown up with pucker brush and scrub as to be impractible of development. The remaining 100 acres is tolerably well timbered with hard and soft woods suitable for steaming purposes. The property extends from Musquash harbor inland one and a half miles. A straight turnpike road with a down grade to the harbor has been constructed into the heart of the deposit, where a substantial frame factory has been erected. At the harbor end of the road a wharf and breakwater are in course of construction and nearly completed. The harbor thus formed within Musquash harbor is thoroughly sheltered, and is a safe loading dock for vessels of large size winter and summer. The deposit has been drained to a depth of ten feet. As evidenced by excavations already made, the yield of this area to this depth is about 400,000 tons of pure peat moss. It is calculated that with the improved machinery this company will produce about 150,000 bales a year in the premises already erected. There is ample market for this quantity even at the present rate of consumption, but as peat moss is a new article for cattle and horse bedding, the consumption of which is constantly on the increase, the promoters of the company believe in a much more extensive trade in the near future. A number of prominent St. John men are now interested in the project, and there is every prospect of the company being a great success."

Daily Telegraph - Nov. 6, 1888 Moss Litter. - A number of prominent citizens interested in the production of moss litter visited Musquash on Saturday to see the locality where the supply of moss is abundant. The moss is found in the large bog or barren at Musquash, and the Moss Litter Company undertakes to ship the material to the American markets. Musquash harbor affords convenient facilities for shipping the moss which is found near by."

S.J. Daily Sun - Sep. 21, 1888 and Daily Telegraph - Sep. 21, 1888 The Moss Litter Company. - Letters patent have been issued incorporating Robert Wisely, William B. Wallace, G.W. Clowes Carman of Musquash, Warwick W. Street of Englewood, New Jersey, for the purpose of the sale and purchase or real and personal property, and the right to acquire by purchase, lease, or otherwise, the right of securing, raising, getting and working of mosses and lichen; the right to prepare, manufacture, ship, deal in mosses and lichen for litter and other purposes; the right to buy and sell merchandise, and to carry on a general business in mosses and lichen, with all the powers incident thereto, by the name of The Moss Litter Company; with a total capital of two hundred thousand dollars, to be divided into twenty thousand shares of ten dollars

Codes: M4 / IDX_Names: Mushquash Peat;
S.J. Daily Sun - Apr. 25, 1889 and Daily Telegraph - Apr. 25, 1889 Moss Litter. - The moss used for littering or bedding down horses and cattle is what is known in Europe as sphagnum or peat moss. It has been used in Europe and the British Isles for ten or fifteen years, and it has grown so in favor with horseman and farmers that the demand is quite equal to the supply there. It has been introduced into the United States about four years and has superceded straw much more quickly than it did in the older countries. Owing to the increasing demand on both sides of the water and the delay in bringing

shipments across the Atlantic the dealers in the United States are frequently unable to supply the rapidly increasing demand for moss. The moss is a pure vegetable, entirely free from any impurities, and you cannot soil your clothes and hands in handling it. It is a wonderful absorbent and will take and retain nine times its weight of liquid, and when used in the stable for bedding for cattle and horses all urine and moisture from the droppings is perfectly absorbed. This, besides keeping the animals and stables clean and sweet, makes the manure more valuable. At this season's spring session of the Long Island agricultural society, one of the most prominent farmers' clubs in the U.S., moss litter manure was voted the best known fertilizer in existence. As a deodorant its effect is marked in the horse stable by the absence of the ammonia fumes so injurious to the eyes of the animals, and in the cow stable by the entire dissipation of the odors arising from the manure so inimical to milk and its products; also, it makes the stable pleasanter to approach and it will not take fire readily or blaze. The New People's Encyclopedia of Universal Knowledge says of it: It possesses a decided and powerful antiseptic property which is attributed to the presence of gallic acid and tannin, and is manifested not only in the preservation of ancient trees and leaves, fruit, etc., but even of animal bodies. The discovery that the barren at Five Fathom Hole, about 350 acres in extent, was a huge deposit of about 400,000 tons of this moss of the very best quality is one of the most important finds in America. About 300 acres of this deposit is free from pucker brush or any surface growth whatever, gravel, sand or mud, and in that differs from any found on the American coast, and has been proved superior in quality to the European importations. The natural advantages of the Moss Litter company's deposit at Five Fathom Hole are so great that an expert sent here by the New York importers of moss are reported that the location seemed of providential origin and he considered that with good management the company was beyond successful competition. During the past winter preparations have been made for an early spring opening and active operations have been commenced. The directors of this company are: Hon. D. McLellan, president; W.H. Thorne, vice president; W.F. Todd, L.J. Almon, Dr. J. Berryman, M.P.P., T.C. Wallace and W.W. Street. Thos. Stead, secretary-treasurer, office Victoria wharf. It is their intention to push the work, and with such a board of management the business should be a

Evening Gazette - Apr. 27, 1889 Moss Litter. - Operations Commenced at Musquash. - The Moss-litter Company has now commenced operations at Five Fathom Hole, ten miles to the westward of this city and the work will be conducted with great vigor during the summer and a large quantity of the product placed in the New York market. A great deal of attention both at home and abroad, has been attracted to this singular deposit, which bids fair to prove a mine of wealth to the company. It is what is known in Europe as sphagnum or peat moss, and is extensively used for littering or bedding horses and cattle both in Europe and America. It has been in use in Europe and the British Isles for ten or fifteen years, and it has grown so in favour with horseman and farmers that the demand is quite equal to the supply there. It has been introduced into the United States about four years and has superceded straw much more quickly than it did in the old country. Owing to the increasing demand on both sides of the water, and the delay in bringing shipments across the Atlantic the dealers in the United States are frequently unable to supply the rapidly increasing demand for moss. The moss is a pure vegetable, entirely free from any impurities, and you cannot soil your clothes and hands in handling it. It is a wonderful absorbent and will take and retain nine times it weight of liquid, and when used in the stable for bedding for cattle and horses all the urine and moisture from the droppings is perfectly absorbed. This, besides keeping the animals and stables clean and sweet, makes the manure more valuable. At this season's spring session of the Long Island agricultural society, one of the most prominent farmers' clubs in the U.S. moss litter manure was voted the best known fertilizer in existence. As a deodorizer its effect is marked in the horse stable by the absence of the ammonia fumes so injurious to the eyes of the animals, and in the cow stable by the entire dissipation of the odours arising from the manure so inimical to milk and its products; also, it makes the stable pleasanter to approach and it will not take fire readily or blaze. The New Peoples' Cyclopedia of Universal Knowledge says of it: It possesses a decided and powerful antiseptic property which is attributed to the presence of galtic acid and tannin, and is manifested not only in the preservation of ancient trees and leaves, fruit, etc., but even animal bodies. The deposit of moss litter at Five Fathom Hole comprises 350 acres of territory and is estimated to contain about 400,000 ton of the product in a dry state for market. Four-fifths of this area is entirely free from brush or any surface growth whatever, as well as from sand, gravel or mud, so the process of preparing it for market is comparatively easy. It is expected that this year at least twenty thousand tons will be placed in the American and home markets. The selling price is from $12 to $15 a ton, and the demand is far greater than the supply. The bog is on the border of Musquash Harbour so that the moss litter can be shipped from that point with the greatest ease. The prospects of the company are therefore excellent for large profits. The directors of this Company are: Hon. D. McLellan, president; W.H. Thorne, vice-president; W.F. Todd, L.J. Almon, Dr. J. Berryman, M.P.P., T.C. Wallace and W.W. Street. Thos. Stead, secretary treasurer, office Victoria wharf. We understand that a small quantity of the stock of this Company is still in the hands of Mr. W.W. Street for sale."

Codes: M4 / IDX_Names: Mushquash Peat;

Daily Telegraph - Aug. 23, 1889 Peat Moss. - This article, which is an aggregate of vegetable growth, is of marshy origin and in many places, such as in the deposit lately opened at Musquash, from sphagnum, these beds of moss are found of great depth as well as extent; but they are only known on the surface of the earth and as belonging to the most recent geological period, the older beds having been converted into coal more or less bituminous. All persons coversant with agricultural chemistry know that nitrogen is the most important and the most expensive of the four essential elements of fertilizers, but all do not know the large quantity of this invaluable substance which is stored up in peat moss. Stable manure usually contains less than one per cent of nitrogen, while Prof. Johnson found the average amount contained in air dried peat to be one and a half per cent, or more than three times as much as is contained in ordinary barn yard manure. The acidity of peat moss, which is objected to, can easily be neutralized either by fertilizers carrying an excess of lime or when it is employed as a litter, by which means this neutralization is effected by the ammonia resulting from the fermentation of the manure and the humic acids in peat form very effective means for the absorption of ammonia and for the preservation of manure. The greater part of the nitrogen in peat, although in a form which is not available for plant food, can yet do a great extent, under proper treatment, be fitted for that purpose especially when used as bedding for cattle, where it acts not only as an absorbent but also as an antiseptic. As the Musquash peat moss is likely to come largely into use in stables, it might be well if some of it were analyzed by some experienced agricultural chemist, and the amount of nitrogen contained in it determined, so that some calculations might be made on its value as a fertilizer after being composted or subjected to such treatment as would render its vast stores of nitrogen available for agricultural use. Edward Jack. Fredericton, Aug. 19"

Evening Gazette - Jun. 7, 1889 Charlotte Co. - The first consignment of New Brunswick peat moss for St. Stephen arrived by the Short Line one day last week and was immediately taken to Mr. W.F. Todd's stock farm, where it will be extensively

Evening Gazette - May 20, 1889 The Moss Litter Company. - For some days past works of the Moss Litter Company, Five Fathom hole, have been in full operation and quantities of the moss have been forwarded to St. John, St. Stephen and Fredericton, for samples. Today some new machinery is to be put in operation which will increase the output and will admit of a large quantity of the moss being placed in the St. John market at once. The company are now in a position to ship moss in any quantity, and have orders for a considerable amount ahead."

Evening Gazette - May 30, 1889 The Moss Litter Company. - The Moss Litter Company, of this city, has disposed of a quantity of their moss litter to the St. John city railway company and is now in use in their stables. It is also in use in the Queen Hotel and Barker House stables in Fredericton. Mr. A. Vanwart has also put it into use in his livery stable, North End, and Mr. W.W. McCormack and Dr. Berryman are using the litter in their private stables. When the Moss Works were organized in this city it was not thought that there would be much local demand for the class of bedding but horsemen always appreciate a good thing and there is no question that Moss Litter for bedding horses and cattle is the best thing in the world. Bailey's Magazine, the greatest of English authorities, in a recent article on the care of hunters recommends

Codes: M4 / IDX_Names: Mushquash Peat;
Evening Gazette - Nov. 25, 1889 Moss Litter. - The Big Barren Likely to Prove a Big Bonanza. - The Works at Musquash - The Machinery, and the Process the Moss Goes Through. - In the early part of 1888 Mr. T.C. Wallace secured for himself and others, the refusal of the Big Barren, a large area of waste land on the St. Andrews Road, about nine miles from this city. Through Mr. Wallace's instrumentality, Mr. Theodore G. Bennett, a prominent manufacturer of Michigan, was interested in the project of turning the barren to account. Accordingly, in June, 1888, he visited St. John, and with Mr. Wallace and Mr. G. Clowes Carman made the final purchase of the property, paying for it a considerable sum of money. The value of the property consists in an extensive deposit of peat moss, in places 30 feet in depth and practically inexhaustible. Peat Moss, imported from Germany, is used extensively in the United States, particularly in the cities, and on fancy horse and cattle farms for bedding, and it is admitted to be the best article for that purpose yet discovered. When dry, it is a disinfectant and a great absorbent of water, so much so, that those who speak from experience and are competent to give an opinion, say for the purpose of bedding horses or cattle, it is cheaper and much better than straw. It is also very valuable as a manure, and has been highly recommended, by leading agriculturists in and around New York, for mixing with barnyard manure or excrement to be used for fertilizing purposes. The work of developing the property was commenced in July last year, and in September, about two months later, a company with a capital of $200,000 was formed to carry on the work on an extensive scale. Several gentlemen besides those already mentioned are interested, among them being Mr. W.F. Todd, of St. Stephen, who is known as an enterprising manufacturer of lumber, and as a gentleman who takes a deep interest in stock raising, being owner of several of the best horses in the New England States and New Brunswick. In December last the active control, or management for the company, passed into the hands of Mr. T.C. Wallace, who has since then been actively engaged in experimenting, and taxing his inventive faculties to their utmost tension to secure machines suitable for the purpose of pressing the water from the moss, and preparing it for use. The task to which he set himself was a heavy one. No machinery suitable for the task was ever made in America and the work of inventing and testing had to go on together. The result that designs of machinery, which were found by actual tests to be suitable, were prepared by Mr. George H. Waring with the assistance and under the direction of Mr. Wallace. At the annual meeting of the company held in September of this year Mr. Waring was instructed to proceed with the construction of the machinery, and since then the work has been going on at his foundry at Indiantown. Such good progress has been made that the largest machine which is about 17 feet high and weighs over ten tons is so nearly completes that it will be taken to the works at Musquash this week and set up ready for work. It is called the flushing machine. Another machine called the wringer is also nearly completed; it will weigh about seven tons. Both machines include so many new and original features and appear so admirably adapted for the work they are intended to perform that great credit is reflected on the inventive skill of Mr. Wallace and Mr. Waring. The flushing machine or the machine to be used in pressing the water from the moss is, in appearance, a cumbrous combination of cogs, cylinder cranks and levers, placed about as closely together as they could possibly be arranged, in a heavy timber frame work, about 8 by 9 feet

square and 15 or 16 feet high. It is in reality a most admirably arranged machine for doing the work for which it is intended. The principal part of the machine is the bucket cylinder. It is 8 feet 6 inches in diameter and five feet long and looks at first sight something like a small overshot water-wheel. On its outside are eight buckets, each being the length of the cylinder, five feet, and two feet wide and two feet deep, or large enough to hold 20 cubic feet of moss. When in operation the machine will be fed with moss carried direct from the bog by means of a carrier chain regulated by a shaft above the cylinder. The latter revolves at the rate of about two revolutions per minute, being turned one bucket at a time by means of a rachet wheel driven by a cam motion from the crank shaft above. The buckets are of cast iron, the bottom being deeply corregated. One motion of the cylinder brings the bucket containing the wet moss directly on the top of the cylinder. When it arrives there a heavy plunger, with a cast iron face corregated to correspond with the bottom of the bucket, descends upon the moss and squeezes the water out through the perforated sides, bottom and ends of the bucket. The plunger being perforated the water can also escape upwards as well as through the bottom, ends and sides. The plunger is arranged with a counter-balanced motion of cranks and levers, so that whether the quantity of moss in the bucket be large or small, it makes no difference, the pressure being regulated automatically by means of the levers and weights. This arrangement also gives a continued pressure for several seconds, the weights and levers holding the plunger down while all the water is squeezed out, and escapes before the crank goes around far enough to lift the plunger from the bucket. When the plunger lifts, another motion of the cylinder places beneath it the next bucket of wet moss. The plunger falls again. The water is squeezed out and another motion of the cylinder brings up another bucket from the feed chain and empties the first one out on the other side. As the moss drops from the squeezing machine it is carried off to the wringing machine on another carrier chain. All the water from the finishing machine is carried off from the interior of the cylinder by means of a sheet iron sluice, and to arrange it so that this could be done one end of the cylinder had to be cast without a centre, or with nothing but the outside rim, and it is run on bracket shafts one inside of the rim at the top and two at the bottom one on either side of the cylinder and outside the rim. The wringing machine does not look so complicated as the one just described. It will be arranged so that the moss will be carried through between two belts for a distance of about eight feet. The belts will be five feet in width, being made especially for the purpose. The lower one will be of finely woven brass wire with a woollen covering, so that the water wrung from the moss will run through it. Steel bars attached to the inside of the wire belt move with it and prevent it from bagging with the pressure. They also contribute to the regular motion of the belt as they drop into sprocket wheels attached to the ends of the drums on which it revolves. The upper belt is heavy and is arranged to run at such an incline that where the moss goes in between the belts the space is about two feet in height, and where it comes out they are only 4 or six inches apart according to the amount of pressure required. By the time the moss gets through this machine the water must be pretty well squeezed out of it. However, it must need to be perfectly dry. To accomplish this task of drying the moss perfectly without burning or baking it, Mr. Wallace has invented a most ingenious contrivance. It consists of a large frame tunnel, lined with sheet iron, 4x5 feet inside and 36 feet long, one end being elevated 16 or 17 feet from the ground, giving it an incline of about 80 degrees. Inside of the tunnel the carrier chain is arranged to run up and down over ten rollers placed at a height of three feet from the bottom of the tunnel. The air in the tunnel is heated to a high temperature by means of long pipes along the bottom, but the supply of heat can be regulated by means of slides, and a continuous current of the heated air is kept passing through, by means of a 72 inch Backus exhaust fan. Thus the moss brought in from the wringer on the carrier chain is carried up an incline of 31 degrees inside the tunnel and drops three feet through the current of heated air, to be picked up again and carried up a second incline and dropped through the hot air again, being elevated and dropped ten times in the passage through the tunnel. In being thus elevated and dropped loosely through the current of heated air all the moisture is completely dried out and when the moss passes out of the end of the tunnel it is conveyed direct to the baling press by the same means it has been carried from the bog to the machines and from one machine to another. The moss will be put up in bales about 3 feet long and 14x16 inches square, weighing 200 pounds and bound with slats and wire. The machinery for putting up the bales is also a clever contrivance and may be termed a perpetual baling press, as the work goes on continually, the moss going in loose at one end and coming out in tightly pressed bales at the other. It was constructed by Mr. James E. Trenholm, of Sussex, N.B., on the same principles as his hay presses, only a few changes being made to render it suited to the special work for which it was intended. Thus we see that the whole process of preparing the moss for use is done by machinery. It is calculated these machines will have a very large capacity, and when they are in full running order a great quantity of this valuable deposit of moss can be prepared at a reasonable cost. At the works at Musquash harbor work has also been going on rapidly for some months past. Large buildings have been constructed, and a tramway for the more economical handling of the product has been completed. By the end of this month, or early in December, all the machinery will be in place and the works in full running order. The deposit is the only one of pure moss that has yet been discovered in the province or in fact on the continent. There have been reports of other discoveries but investigation of some of them has proved that the moss is more or less mixed with earthly matter or grit, which renders it almost valueless for bedding purposes for horses or cattle. The moss at Musquash is of fine texture and entirely free from either grit or foreign growth of any kind whatsoever. The facilities for handling it are excellent. The company's land fronts on Musquash harbor. They have erected a breakwater there, and are building a wharf so as to be in a position to ship readily by sea. A tramway will also be built across the barren to the Shore Line Railway which crosses the rear of the company's property, so that the

S.J. Evening Gazette - Nov. 25, 1889 Moss Litter Co.'s Machinery. - The large Backus exhaust fan to be used for exhausting the moist air from the moss drying tunnel at the Moss Litter Company's works, Musquash, arrived here by the American boat on Saturday and will be forwarded to the works by the Grand Southern railway. The fan is 72 inch skeleton and was made by the Backus Water Motor Company of New Jersey."

S.J. Globe - Sep. 18, 1889 The Moss Litter Company. - The first annual meeting of the Musquash Moss Litter company was held this morning. The report of the secretary was submitted and showed the company was in good condition. All of the stock has been subscribed for and the amounts paid up. A number of bills were passed and the president stated there was sufficient money to meet them all. Bye laws were adopted and other routine business was gone through with. The president stated the company had only been running since January last and in that time they have spent in the vicinity of $11,000 getting the property in order for carrying on their operations. A quantity of machinery has been purchased and more will be got in a short time. It is the intention to push the operations forward as speedily as possible. The election of directors resulted as follows: Messrs. W.F. Todd, St. Stephen; Geo. H. Waring, Indiantown; C.E. Boardman, St. Stephen; Joshua Knight, Musquash, and T.C. Wallace, St. John. At a subsequent meeting of the directors, held this afternoon, Mr. Todd was elected president and Mr. Thos. Stead, secretary."

S.J. Daily Sun - Sep. 19, 1889 Moss Litter Company. - The annual meeting of the Musquash Moss Litter Company was held yesterday. The report of the secretary showed the company was in a good condition. All of the stock has been subscribed for and the amounts paid up. A number of bills were passed and the president stated there was sufficient money to met them all. Bye laws were adopted and other routine business was gone through with. The president stated the company had only been running since January last and in that time they have spent in the vicinity of $11,000 getting the property in order for carrying on their operations. A quantity of machinery has been purchased and more will be got in a short time. It is the intention to push the operations forward as speedily as possible. The election of directors resulted as follows: W.F. Todd, St. Stephen; Geo. H. Waring, Indiantown; C.E. Boardman, St. Stephen; Joshua Knight, Musquash, and T.C. Wallace, St. John. At a subsequent meeting of the directors, Mr. Todd was elected president and Thos. Stead

Daily Telegraph - Sep. 19, 1889 Musquash Moss Litter Company. - The first annual meeting of the above company was held yesterday morning. Bye-laws were adopted and routine business transacted. The election of directors resulted in the following being chosen: Messrs. W.F. Todd, St. Stephen; Geo. H. Waring, Indiantown; C.E. Boardman, St. Stephen; Joshua Knight, Musquash; and T.C. Wallace, St. John. Mr. Todd was afterward elected president and Mr. Thos. Stead, secretary. It was stated that the company had only been running since January last and in that time has spent in the vicinity of $11,000 getting the property in order for carrying on their operations. A quantity of machinery has been purchased and work will be at once pushed forward."

S.J. Daily Sun - Dec. 9, 1891 and Fredericton Daily Gleaner - Dec. 9, 1891 The Moss Litter Company. - The annual meeting of the Moss Litter company was held yesterday at the office of the company, when the following directors were elected: W.F. Todd, St. Stephen; F.C. Wallace, George H. Waring, L.J. Almon and C.A. Clark, St. John. The directors reported that after repeated failures, they have at last succeeded in hitting upon the right principle for squeezing and evaporating the moss and that the machines constructed on this principle were proving a success. It is expected the works

Codes: M4 / IDX_Names: Mushquash Peat;

Daily Telegraph - Dec. 9, 1891 Moss Litter Works. - The annual meeting of the Moss Litter Co. was held at their office in this city, yesterday afternoon. The following new board of directors were elected for the ensuing year: Messrs. W.F. Todd, Lewis J. Almon, T.C. Wallace, Geo. H. Waring and C.A. Clarke. The directors reported that the machinery lately put in the works at Musquash had proved satisfactory. It is expected that everything will be in running order at the works in a short time and the directors look forward to a prosperous season."

St. Croix Courier - Dec. 30, 1891 The Moss Litter company held its annual meeting yesterday and adjourned for two weeks to get a full report on the machinery. It is understood that the machinery put in within the last three months has proved to be on the correct principle, and it is merely a matter of a few days or weeks to get the litter in the market in large quantities. A large shed has been erected near the bog to enable the operations to be carried on during the winter. W.F. Todd and C.A. Boardman of St. Stephen, visited the works at Mossbank yesterday and inspected the works, which ran very smoothly. Messrs. Todd and Wallace are to be congratulated on having at last got the works so that they can be sure

S.J. Globe - Feb. 24, 1891 Equity Court. - Mr. W. B. Wallace, on behalf of the defendants, made a motion to dismiss the suit of James H. Robinson vs. the Moss Litter Company, for want of prosecution, on the ground that the time for setting down suit for hearing after issue joined has expired. Cause was set down for hearing on the last Tuesday in March, Mr. Wallace to be paid costs of preparing motion up to the seventeenth of February instant. Dr. F.E. Barker, Q.C., appeared

Evening Gazette - Jul. 11, 1891 The case of James H. Robinson vs. The Moss Litter Company is still before the court. Mr. W.W. Street was on direct examination by Dr. Fred Barker, Q.C., all yesterday and is today being cross-examined by Mr. W.B. Wallace."

St. Andrews Beacon - Jun. 16, 1892 The Musquash moss works are now an assured success."

St. Andrews Beacon - Apr. 27, 1893 The peat moss works at Musquash are gradually being got into running shape. Up to the present stage the operations have been largely of an experimental character, but the promoters think they have struck the right kind of machinery at last. If it does what is claimed for it, it will not be long before the work of exportation will

St. Croix Courier - Jul. 13, 1893 Peat Moss. - The Valuable Deposit at Musquash and Its Prospects. - According to the Fredericton Herald, Mr. McFarlane, the chief analyst of the dominion, has been in Europe during the past winter for the purpose of examining into the peat moss business there. On his return to New Brunswick, he saw from the report of Mr. Chalmers on the surface geology of New Brunswick that there were large deposits of this substance at or near Musquash, N.B. He has accordingly visited this locality, and is reported as having said that this deposit was superior to anything which he met with in Germany and that the Dominion will need all the output from this deposit. The Peat Moss Company at Musquash have been and are still working at experiments in drying the article and if they succeed in so doing at a cheap rate there is no doubt whatever but that they will have as much or more work than they can do to supply the demand."

Codes: M4 / IDX_Names: Mushquash Peat;
St. Croix Courier - Oct. 12, 1893 Moss Litter. - Some Account of the Value of the Material. - As our readers are aware, Mr. W.F. Todd, of St. Stephen, has been putting up costly machinery at Musquash, for the purpose of preparing for the market the extensive deposits of peat moss of which he has control. From a series of articles by Mr. Edward Jack which have recently appeared in a St. John paper, we condense the following statement of the character and uses of the product known as moss litter. The property which above all others renders turf so valuable as a litter is the power of absorption which it possesses. This is very different in different kinds of turf. While some of it which has been dried in the air, containing 20 per cent of water, will absorb but twice its own weight, there are other kinds which will absorb even to twenty times their own weight. This difference arises from the structure of the turf, partly from its botanical constitution and partly from its degree of decay. The more the turf is decayed the less fluid it will absorb. The bright, light, fibrous little decayed turf, which forms the upper layers of many moors has a greater absorptive power than the dark heavy turf which is adapted to heating purposes alone. The botanical character of the moss is, however, the matter of greatest importance. We find in the first rank, turf formed from Sphagnum moss, of which there are at least twelve varieties in New Brunswick. The enormous absorptive power of this moss arises from the fact that the leaves and outer covering of the stalk are composed of large empty cells, which, owing to their peculiar structure, can fill themselves with water. Sphagnum forms the chief element in the raised peat bogs at Musquash. A German investigator, Dr. Kreuzhage made, not very long since, some careful experiments as to the benefits to be derived from the use of moss litter in stables, and reached the following conclusions: 1. Moss litter offers horses a better and softer bed than straw, and when well laid it does not scratch them as does the straw. 2. Moss litter is much better for the hoofs of horses standing upon it than straw. The use of moss litter greatly decreases the quantity of carbonic acid in stables as compared with that of common straw litter. This has been well proved by experiments, very carefully carried out by Regimental Veterinary Surgeon Arnold, in Germany. Twice as much carbonic acid was found in stables in which straw was used as a litter, as was met with in those in which moss litter was made use of. By its absorption of fecal matter all disagreeable smells are prevented and vermin which are attracted thereby also to a very considerable extent disappear. That moss litter, especially the dust from it, (Torf mull.) forms a most efficient means for deodorizing bad smelling places in a very short space of time, has long been known. This property, as well as its absorptive power, point to it as a vehicle for rendering easily transportable the fecal matter of cities. For which purpose, indeed, it is being eagerly used in certain cities in Europe. As bacteria or disease germs can only be propagated when moisture is present, moss litter will undoubtedly serve as a check to their extension. Moss litter dust has also been used in bandages for the treatment of wounds. Besides its use for horse stables it can be made use of as bedding for cows and in hog pens and hen houses, thereby purifying the air and at the same time forming one of the very best fertilizers, a fact which is self evident from the well known asuidity with which this article seizes upon nitrogen, the most expensive element which enters into the composition of a complete fertilizer. Moss litter fertilizers are readily bought up by gardeners and other agriculturalists in Europe, whenever they can be had. The removal of fecal matter from certain cities in Europe has from this fact been made a profitable instead of a costly matter. As kainit (one of the salts of potash), which is largely used as a fertilizer in Europe, has a tendency to harden into lumps, this is prevented by the addition of moss litter dust. Moss litter affords an excellent article for all kinds of packing purposes, and its qualities render it one of the very best materials for the filling of mattresses. In the preparation of ice houses it can be used to the greatest advantage. In Italy it has been used for the purpose of filtering oil. As to its preservative powers it may be mentioned that at the moor exhibition held about the last of July, 1889, at Magdeburg, potatoes which had been dug the previous year were exhibited, which yet retained all of their original freshness and did not show any signs of sprouting or decay. Many other instances of the preservative power of moss litter have been observed. Fresh caught sea fish packed in moss litter were sent from the Adriatic Sea to Stockholm, where they arrived after an eighteen days journey, as fresh as when taken from the water. The experiment was repeated and a sea fish packed in the same material was sent from Stockholm to the general assembly of the Moor Kulturvereins at Berlin, which also, after a six days journey, to the surprise

St. Croix Courier - Sep. ??, 1893 The first consignment of moss litter was shipped from Lepreaux to the United States on Monday. After five years of effort in experiments the machinery has been perfected for drying the litter, and the works will now start with a capacity of about 25 tons a day."

St. Croix Courier - Aug. 2, 1894 ADVERTISEMENT: Moss Litter For Sale. ------- A cheaper, better bedding than straw. A perfectdisinfectant and germ killer. No danger from fire in its use. An animal kept cleaner and healthier when bedded upon it. One of the very best fertilizers known after use. For sanitary purposes it is unsurpassed. Apply to W.F. Todd, St.

S.J. Daily Sun - Aug. 31, 1894 Moss Litter From Musquash. - A Sun man who dropped into the warehouse of C.H. Peters, Peters' Wharf, yesterday, was shown a lot of bales of moss litter, a carload having just been received from the well-known Musquash moss litter deposit. It is put up in hard pressed, oblong bales, weighing from 100 to 150 lbs. each. It is a marvelous absorbent, and it is claimed that a bedding three inches deep in a horse's stall will last for three months without requiring to be renewed. It is also incombustible. The proprietors of the property at Musquash have spent a great deal of money in perfecting their plant for the drying of this litter, and appear at last to have achieved success. It is now a merchantable commodity, at all events."

St. Croix Courier - Mar. 4, 1894 Moss Litter. - A Note on the Subject From a High Authority. - In the last Courier there is an extract from the Canadian agricultural report, in which it states that Germany and Holland have for some years been exporting to Great Britain and to the United States for use in stables as bedding and as an absorbent bog moss, known in England as moss litter, and generally known as sphagnum. Now very much of the moss litter has little or no sphagnum in it, but consists of the remains of eriophorum and other plants. I had a specimen of some German moss litter - much is being sold in Boston - sent me a few weeks ago. I could see no signs of any plants of sphagnum in it. It looked like a worn amorphous mass and by pulling it to pieces I could detect the stalks of what seemed to me to have been Eriophorum (cotton tuft grass). It had very little elasticity and its power of ready absorption must have been very small indeed. One thing is certain, that we have a large quantity of a far better article in New Brunswick - enough in fact to supply the United States with more than they need at present and probably for years to come. How Mr. Angers has ascertained that the average thickness of the growth of Canadian sphagnum is about four feet, I cannot imagine. When we consider the many uses to which the vast supply of sphagnum moss which exists in New Brunswick can be put, for sanitary as well as for agricultural purposes, we may feel assured that the day is not far distant when this valuable article will receive that attention which its merits and abundance demand. Edward Jack"

St. Croix Courier - Nov. 22, 1894 The moss litter which is being prepared by Mr. W.F. Todd is meeting with an extensive sale in all parts of the province. The Fredericton papers state that those who use it in that city consider it superior to all other materials used for similar purposes."

Observer - Dec. 5, 1848 and Miramichi Gleaner - Dec. 5, 1848 Deposit of Rock Salt in New Brunswick. - We understand that an American citizen has discovered an extensive deposit of Rock Salt in this Province, and he has made a proposition to the Government of New Brunswick to make them acquainted with the locality, on being assured of a small per centage on the duty paid to the Government on the quantity raised, and this only for a limited term of years. As this proposition involves no outlay on the part of the Government, and offers the greatest security against deception or imposition, we hope our American neighbour's proposition will be favourably received, for if no salt is raised no money is to be paid, and the Government have it at all times in their own power to regulate the rate of duty which shall be collected on the mineral. It is, however, rather singular that we should have had a Provincial Geologist wandering over the face of the country for years, at a heavy expense to the public, and that he should have discovered no indications of this deposit during his peregrinations. Fortunate be for the public a lynx-eyed Yankee occasionally follows in the track of these well 5 paid official gentlemen, and when they make a discovery, such as we have just referred to, we see no reason in the world why they should not be permitted to benefit by their ingenuity. - Head Quarters."

Moncton Daily Times - Jul. 26, 1879 A Salt Mill at St. John. - Messrs. Kenney, Haley & Co., have commenced the erection of the salt mill, ofwhich mention was made some time since. The mill will be on Main Street near Charlotte Street extension. The foundation has been laid and work is being pushed rapidly."

Daily News - Apr. 8, 1880 Salt Works. - Mr. K.H. Israel has recently purchased the New Brunswick Salt Works and had them fitted with new and improved machinery for the refining of salt. He manufactures a very fine quality for table and dairy use from West India sea salt, which is put up in packages of five and ten pounds each. The factory is situated on Main street. See advertisement."

Daily News - Apr. 8, 1880 ADVERTISEMENT: New Brunswick Salt Works, Main Street, St. John, N.B., E.H. Israel & Co., ... Proprietors. Having purchased the above works, fitted with new and improved machinery for refining, we beg to call the attention of the trade to the fine quality of Table and Dairy Salt, manufactured from West India Sea Salt. Put up in packages of 5 and 10 lbs., and at prices that will suit the closest buyers. Orders solicited. E.H. Israel & Co."

Codes: O7 / IDX_Names: Salt/Potash - Sussex Area;
S.J. Daily Sun - Apr. 13, 1880 The New Brunswick Salt Works. - A short time ago Mr. E.H. Israel, formerly in the dry goods business in this city, purchased the New Brunswick Salt Works, put up and run for a short time by Messrs. Kinney & Blithen, from these gentlemen, and is now carrying on a snug little business. The factory is situate on the north side of Main Street, and a full description of it, as well as of the machinery there in for drying and grinding the salt, was given in the local columns of The Sun when the manufactory first started. The same machinery is still in use by Mr. Israel, but that gentleman has put in a great many improvements of different kinds, and now has his manufactory in thorough and perfect running order, and is, besides, running steadily. The place has been running for about a month, and Mr. Israel is turning out a first class article of extra refined table and dairy salt, the quality and color being even better than was turned out formerly, when a fine article of salt was put on the market. West India salt is used altogether, it being brought by schooners; and there is a general air cleanliness and neatness where the salt is dried, ground up and put up in bags. In reply to the question of what business he was doing, Mr. Israel said: I am doing a very good business and have got some very good orders. I have been in running order about a month, and have as much work as I can do, and orders still to fill. The business is done nearly altogether in St. John, although some orders have gone to Halifax and some to the country. The trade is principally with the wholesale dealers, but some is done with the retailers. All who have purchased any of my

salt have expressed entire satisfaction with it. I have just finished a big order for Mr. Geo. S. DeForest, South Market wharf, for 50 barrels. We are turning out now 1,000 five-pound bags per day, and could turn out more. My mill has a greater grinding capacity, but the drier is too slow, and the mill is often lying idle waiting for it. I am thinking of getting in more perfect and quicker drying machinery. Excellent samples of salt for dairy or table use are shown by Mr. Israel - pure, white and well ground and of excellent quality. The mill employs two men and a boy, and keeps three girls busy bagging the salt. Mr. Israel is showing much enterprise in his new departure, and it is to be hoped that he will be rewarded with abundant success, as here is every indication at present he will."

S.J. Daily Sun - Mar. 20, 1880 New Brunswick Salt Works. - These works have changed hands, and are now under the management of Mr. E.H. Israel, who is turning out a superior article of salt and receiving large orders."

St. Andrews Beacon - Dec. 18, 1890 Edward Jack writes: There are strong probabilities that we have in this Province large deposits of salt, in situations very accessible to railway transportation. Mr. Jack mentions two or three places where salt has been found, but omits Bayside, Charlotte County."

Daily Telegraph - Dec. 31, 1890 Salt in New Brunswick. -To the Editor of the Telegraph:- Sir: Mr. Edward Jack's statements in the Telegraph of the 17th inst. must have taken considerable trouble to glean. Why he allowed the salt springs on the lands of J.H. Mears, St. Croix, and which have been known to the public for over 50 years, to escape his notice, is more than I can think. These springs flow from beneath a bed of marl, of unknown thickness, which in summer flows at the rate of 60 to 80 gallons per minute, yielding a 7 per cent brine for salt. Within the last 15 years I have tasted it many times and used the salt in making butter, it being suitable for that purpose. Being on the sea shore, there will be a great saving in land transit. By building a small wharf, vessels, etc., can be loaded on the premises. Fishermen will gladly take this advantage also, it being in close proximity to the fishing grounds. This brine, maintaining its continuous strength of salt for so many years, clearly indicates its flow to be either over or through a heavy bed of solid salt, which from careful observations I feel sanguine covers an area of many square miles. In confirmation of these views, I quote from Dr. Sterry Hunt, a gentleman whose opinion I would accept at all times: The existence of salt at Clinton, 13 miles to the southeast, and at Kincardine 30 miles northeast of Goderich, 40 miles apart, it is therefore extremely probable that the whole region will be found underlaid by salt, and may belong to a large basin whose ... [last line cut off]."

St. John Star - Aug. 2, 1901 Salt Wells have been discovered at Mears farm at Bay Side, N.B., and the prevalence of the rock in large quantities is almost assured."

N.B. Reporter - Aug. 7, 1901 Salt wells have been discovered at Mear's farm at Bay Side, Charlotte county and the prevalence of the rock in large quantities is almost assured, and development proceedings will be taken."

St. Andrews Beacon - Aug. 8, 1901 The Salt Wells at Bayside. - There is good reason to believe that before long the salt wells at Bayside - descriptions of which have from time to time appeared in this paper - will be worked by men who are abundantly capable of developing them. These wells are located on Mr. Joseph Mear's property, about seven miles from St. Andrews. Some samples of the salt recently taken from the wells are of a very fine character. Rock salt has also been found in the sands nearby."

Codes: O7 / IDX_Names: Salt/Potash - Sussex Area;
St. Croix Courier - Jul. 18, 1901 and St. John Star - Jul. 20, 1901 Bay Side Salt Wells. - Some parties interested in mining have recently visited the salt wells on J.H. Mear's farm at Bay Side, N.B., and taken away samples. According to a local paper a half pound of salt was secured from five quarts of water evaporated in tin pans. The salt has been assayed in Boston and pronounced quite pure. There is every indication that if the wells were bored an extensive salt deposit would be found. The salt has been assayed in Boston and pronounced quite pure."
Evening Times Globe - May. 30, 1928 Premier Baxter says ... Mining Outlook. - Inorder to give an impetus to mining there had been enacted a new mining law and much development was now under way, with more in sight. It had been discovered that the province had a large salt deposit and this would be developed, even though it lay under land now under lease to parties for oil and gas development."

Daily Times - Aug. 5, 1929 Exhaustive Study Of Salt Deposits Being Made Here. - Boring Operations by N.B. Gas and Oilfields Co. Going on Rapidly at Pre d'en Haut - Have Already Gone to Depth of 1,600 Feet. - Boring operations are going rapidly ahead at the site of the huge salt deposits near Pre d'en Haut, on the east bank of the Petitcodiac river in the Memramcook district according to Dr. J.A.L. Henderson, managing director, New Brunswick Gas and Oil Fields, Limited. The development work is being done in order to make an exhaustive study of the possibilities of making a profitable use of these deposits. A second bore hole is now being driven and a new coring process is being used in the operation. The salt rock deposit is something more than 1220 feet below the surface of the ground and the bore hole has been sunk through this and continued a further 400 feet into the salt rock itself, making a hole more than 1600 feet deep. Deposits such as this are the basis of huge chemical industries in Great Britain and Germany, Dr. Henderson states, and it is with this in view that an exhaustive study of the Pre d'en Haut deposits is being made. Being geographically located within ..?.. to tidal waters, these would be a great opportunity for cheap transportation of the products of such an industry. If it were established, and ..?.. of inexpensive transportation of the local and other materials that would be required for production purposes."

St. Croix Courier - Jul. 18, 1957 Historic Spot. - by Chester Allen Dixon. - Indian Island. - ... According to history, the lasttime Indian Island was 'denuded' of its softwood stands considerably more than a century and a half ago, the wood was used for making fires under large kettles filled with sea water for the manufacture of salt. The salt works, described as having been a considerable enterprise, was established by a man by the name of Goldsmith, whom James Chaffey persuaded to form the company."

Kings County Record - Feb. 25, 1971 Discover Salt Bed at Plumwesweep. - Exploring Now Being Widened - Possibility that there are extensive deposits of salt in the Plumwesweep area of Kings County, only half a mile 'in' from the Trans-Canada Highway, now is being investigated further by crews sent to the area, by provincial and federal authorities, to conduct exploratory drilling. It now is believed that a salt deposit area has been discovered, this in turn leading to widened efforts to determine the potential width and depth of the bed. Plumwesweep is about five miles east of Sussex. Last December, a contract for about $120,000, for exploratory drilling for possible salt deposits in the general Sussex area was awarded, at Fredericton to Inspiration Drilling, of Bathurst. Announcement of acceptance of the Bathurst tender, the lowest of three bids, was made by the federal department of regional economic expansion and the New Brunswick department of natural resources. A recent agreement between both these levels of government provided for expenditures of $1,080,000 with the aim of accelerating the present five- year program of the natural resources department for development of mineral resources. Other firms were Heath and Sherwood Drilling, Kirkland Lake, Ont., and Canadian Longyear, Ltd., Moncton. In announcing plans for mineral exploration, at the time the contract was awarded to Inspiration Drilling, the federal-provincial officials said 'prime consideration is being given to establishing a salt and limestone mining operation, and the governments are fully supporting this concept.' The agreement, consisting of an accelerated program of mineral reconnaisance, provides for four specific spheres of activity - A geophysical survey to provide technical maps and data to the mining industry in two regions of the province, the Caledonia Mountain area of southern New Brunswick and the Bathurst-Newcastle area; an exploratory drilling program for industrial minerals, such as salt, which are essential to all chemical industries and operations; core storage facilities for constant reference by mining companies will be provided in Bathurst, Fredericton and southern New Brunswick; and an inventory and evaluation of known mineral deposits in view of the eventual acceleration of processing operations and expansion of the mineral marketing situation. The drilling operations at Plumwesweep are being carried out under the direction of the mines division of the provincial natural resources department."

Codes: O7 / IDX_Names: Salt/Potash - Sussex Area;

Kings County Record - Jul. 29, 1971 Salt and Potash Find in Sussex Area Promising. - Important economic benefits may be in store for the province, depending on the quality and extent of salt and potash in southern New Brunswick. This was disclosed during a Fredericton meeting of the Legislature's select committee on natural resources industries by Dr. R.R. Potter, director of the mineral resources branch, and Dr. R.W. Warren, director of mines for the province. Dr. Potter said the Sussex area salt and potash deposits, especially at Plumwesweep, held promise because of their proximity to the port of Saint john as opposed to long rail hauls to West coast ports from Saskatchewan deposits which are currently being mined. The combined rail and sea shipping charges to United States ports where potash is used in fertilizer manufacture were much higher in the West than the short haul to Saint John and shipping by sea to Gulf of Mexico ports for $3 or $4 a ton, he said. Dr. Potter said much more development work remained to be done but the New Brunswick deposits appeared extensive and the future 'looked good.' He said a prime United States source of potash in the Carlsbad, New Mexico, area would be mined out in about 10 years, thereby creating demand for the provincial product in spite of current emphasis on Saskatchewan deposits. A number of other areas are being explored, including potash resources and the Mount Pleasant mine in Charlotte County, where an estimated 20 million tons of complex ore bearing tin, antimony and other metals are located, he said. He told the committee that several millions have been spent on research and development, and added that technical difficulties in the separation process was slowing production development. Dr. Potter said that during 1970, for the first time, mining production value topped the $100 million mark and he forecast a value of about $150 million by 1975, with an increase in employment from 4,000 to 6,000 or 7,000 workers. A realistic objective was about 2,000 new jobs in the five-year period, plus others which could accrue from the secondary side, Dr. Potter said. He said the department was attempting to get diversification in the industry and look to individual metals, as well as lead, copper and zinc. Weaknesses in the present provincial Mining Tax Act were also reviewed after Committee Chairman Leland McGaw (PC-Charlotte) asked what royalties or income from the $100 million production value were received by the Province. Officials said there were no royalties, but mining companies paid a property tax and 10 per cent income tax, although in the first few years of a mine's operation high depreciations were allowed and little money reverted to the province, but at the end of the depreciation period the companies would be paying about $1.5 million in a year or two of time. Committee member H.H. Williamson (Lib.- Bathurst City) said companies could mine high-grade sections of their holdings in the early years and turn profits before they were required to pay much to the province. Committee members agreed there was little protection in the act against high grading' by companies and that information about mineral deposits could not be forced out of companies. On the production side, Dr. Warren said base metals made up 87 per cent of the provincial production, with zinc the highest - 50 million tons for 15 per cent of the national output. The province was fourth among Canadian lead producers with 8.4 million tons and third in bismuth and cadmium. Market prices were generally poor in 1970, he said. Total employment in the provincial mining industry was about 4,536, he said."

Kings County Record - Mar. 18, 1971 Potash Beds Also Uncovered. - Announcement in the Record on Feb. 25 that salt deposits of an encouraging scope had been discovered at Plumwesweep has now brought word from federal and provincial officials that potash minerals have also been uncovered. Drilling and exploration at the Plumwesweep location, being carried on by a Bathurst firm, are being financed by the federal department or regional economic expansion and the New Brunswick department of natural resources. Other drilling operations have now been commenced at a site near Penobsquis. The exploration sites at Plumwesweep and Penobsquis are only short distances in from the Trans Canada Highway. Announcement was made on Monday by Hon. Jean Marchand, federal minister of regional economic expansion, and Hon. W.G. Bishop, minister of natural resources, was that substantial thicknesses of salt and sylvite were encountered in the first hole drilled by the New Brunswick mineral resources branch. This drilling program is part of a detailed investigation of salt deposits in the Saint John-Moncton area and is sponsored by the federal department. Indications of salt have been known for many years and the project was initiated to provide the mining industry with factual data on the quality and quantity of material available. Feel Much of Promise. - Geological and geophysical data indicated a potentially massive salt deposit in the Sussex area, and the first drill hole, now completed at Plumwesweep confirmed the existence of a salt deposit at least 1,700 feet thick and within 1,000 feet of the ground surface. Potash minerals were encountered in this first hole above the salt and at a depth of between 850 and 1,000 feet. The potash-rich zones vary from nine to 32 feet in thickness. Preliminary assay results completed by the minerals science division of the Canada Department of energy, Mines and Resources indicated an average grade of from 21 to 25 per cent K2O equivalent. Although potash has been known to occur in the Atlantic area for some time, it was considered to be present only in limited quantity. Small deposits averaging five per cent K2O occur in the Malagash-Wallace area of Nova Scotia, and traces of potash minerals have been reported from southwestern Newfoundland. The New Brunswick counties of Albert, Westmorland and Kings counties have been withdrawn from prospecting and staking for salt and associated minerals since 1947. Should further work prove the Sussex deposit to contain significant reserves, this discovery would have important economic implications for the region, the announcement stressed. Potash is the term technically applied to any salt containing potassium but is generally used in reference to the raw ore of potassium salts or the finished product - muriate of potash. Numerous deposits of salt and potash are known throughout the world and existing producers face strong international competition. Those located adjacent to shipping ports - Saint John, for example - have a definite economic advantage. Nearly 95 per cent of the world's potash production is for fertilizers, while lesser quantities are used in the manufacture of explosives, textiles, dyes, soaps, glass and numerous chemicals. Drilling in the Plumwesweep-Penobsquis area is continuing and results of exploratory work will be known by late summer of this year. Several other projects under this federal- provincial agreement are scheduled to begin immediately, including an airborne geophysical survey of the area between Moncton and Saint John and detailed followup geological surveys. Can Open Wide Door. - Should further drilling prove the Plumwesweep deposit to contain significant reserves, the discovery would have important economic implications for the area, officials said. The Plumwesweep location is one spot on the 18 to 20 miles vein stretching from Sussex northeast to Petitcodiac. Commenting on Monday's announcement, Mr. Bishop said the potash find 'could be a major economic find for New Brunswick.' The minister said its value was enhanced by proximity to the port of Saint John, which could be used for shipping the mineral to other countries. 'I believe we are in as good a position, if not better, than any other field in Canada,' he added."

Codes: O7 / IDX_Names: Salt/Potash - Sussex Area;
Kings County Record - May 4, 1972 Deposits Could See Major Development. - The rolling hills of the Upper Kennebecasis River Valley sweep around the town of Sussex, a community of 4,000, famous as the dairy centre of New Brunswick, writes Mark Pedersen, of the Canadian Press, in the Moncton Times. His article continues - But beneath the hills at Plumwesweep, just a few miles outside the town geologists have discovered mineral seams containing potash at the relatively shallow depth of 900 feet. The seams have an aggregate thickness of 60 feet. Seven mining companies have submitted proposals for more exploration in the area, and the provincial department of natural resources is expected to negotiate an agreement with one of them before the summer. This may mean millions of dollars of investment and mining jobs. Potash is an essential ingredient for many agricultural fertilizers and sells for about $20 a ton on world markets. The Plumwesweep deposit is 50 miles from the port of Saint John, giving it a transportation advantage over the sprawling Saskatchewan potash deposits that dominate Canadian production. Richard Potter, director of New Brunswick's mineral resources branch, is optimistic the deposit will be developed. Must Have Reason. - If the seams showed no promise, mining companies wouldn't be as keen as they are to explore further, he said. The Plumwesweep seams contain 20 to 25 per cent potash, compared to 25 to 35 per cent in Saskatchewan but the western deposits are about 3,000 feet below the surface. Geologists were looking for salt when they drilled test holes at Plumwesweep and Penobsquis, five miles to the east, early last year. They found beds of high quality salt at Plumwesweep but inter-mixed were the potash seams. Salt, but no potash, was found at Penobsquis. Mr. Potter says the natural resources department doesn't know the length of the potash seams but he believes there may be 100 million tons at Plumwesweep, enough to make a mine at the site feasible. Some geologists believe an investment of $50 million to sink shafts and purchase equipment is possible. This may mean production of 1,000,000 tons of potash a year, creating 400 mining jobs and as many as 2,000 'spin-off' jobs, they say. Low transportation costs would make New Brunswick potash competitive down the Atlantic seaboard to the Gulf of Mexico

and perhaps into the Pacific. There are also lucrative markets for potash in Europe. Salt, widely used in petrochemical industries, could also be developed in conjunction with potash."

Kings County Record - Apr. 12, 1973 To Tell Public of Potash. - A public meeting at which citizens will receive information on the potential potash development in the Sussex area will be held in the auditorium of Sussex Elementary School on Tuesday evening, April 17, at 7 o'clock, it has been announced by Kenneth R. Eddy, president of the Sussex and district Chamber of Commerce. The chamber is sponsoring the meeting as a public service. Expected to attend are Hon. George K. Horton, minister of agriculture and rural development: R.L. Bishop, deputy minister of mines and resources; Dr. R.R. Potter, chief geologist, department of natural resources; B.O.S. Smith, department of regional economic expansion; J.B. Cummings, representative here of Ideal Basic Industries, the developing company, and J.B. Hamilton, A.A. Ruitenberg and John Worth, of the department of natural resources. Mr. Eddy pointed out that the meeting will provide citizens with data available to date on this development, one that could mean much for the area as a whole. He added that 'The meeting reflects in part the chamber's concern for development of our natural resources, and rates one of the highest priorities on our agenda for 1973. We sincerely hope that Sussex area citizens will recognize the opportunity, and attend this important meeting.' The agenda is expected to include visual presentations, information on the mining and refining of potash, market data and the expected outlook in this industry."

Codes: O7 / IDX_Names: Salt/Potash - Sussex Area;
Kings County Record - Apr. 19, 1973 Much To Do Yet In Potash Explorations. - Of necessity, because of the extensive drilling and exploration required, it could be 'some time yet' before it is known whether the salt-potash deposits in the Plumwesweep area can become a viable development; but if this does come about the production from this area could provide key impetus to the general economy of the whole district. Further, because the Plumwesweep deposits are close to a major transportation outlet, such as the port of Saint John, production from this area could be greatly in demand by buyers in world markets. These points were among the many absorbing facets of the present exploration proceedings in the Plumwesweep area which were brought out at a public meeting held Tuesday night in the auditorium of Sussex Elementary School. There was a large audience, and all listened with close attention, and very evident interest, to the speakers. The meeting was sponsored by the Sussex and District Chamber of Commerce in co-operation with the mineral resources branch of the New Brunswick department of natural resources, and Kenneth R. Eddy, president of the Chamber of Commerce, was chairman. Copies of progress reports on the Plumwesweep exploration were available, in detail and illustrated with maps and charts, and these were closely followed by the audience as the speakers gave their observations and comments. In the audience were members of the Sussex Town and Sussex Corner Village councils and a representative number of professional and business men of the general area, those interested in agriculture and other industries, and several women. Speakers were Dr. R.R. Potter, director of the New Brunswick minerals resources branch; J.B. Hamilton, Geologist with that branch; Dr. A.A. Ruitenberg, of the department of natural resources, who will soon be taking up residence in Sussex, and J.B. Cummings, resident representative of Potash Company of America, a subsidiary of Ideal Basic Industries, Inc., of Denver, Colorado, the company exploring the Plumwesweep deposits. Dr. Potter warned that because exploratory holes were being dug it could not be expected that a mine would be in operation overnight. Installing a mine was a long, difficult and arduous task. He noted that salt deposits had been discovered in the area many years ago in the 1860's, the department of natural resources had enquired closely into the possibilities. In 1970, with the co-operation of the federal department of economic expansion, actual steps of exploration were arranged. In 1971-72, drilling was begun in the Plumwesweep area by the Bathurst firm of Inspiration Drilling Ltd. In January of 1973, Potash Company of America was selected, from seven companies offering, as the developing company. There was 'a lot of salt produced in the world, some 147 million tons,' he said, this coming from several countries. Potash came from countries such as Canada, Russia, etc. If, at Plumwesweep, potash could be found at shallow depths, it could be 'mined' much easier than if deeper in the ground. Sussex was becoming known the world over because of the possibilities, and publicity, regarding the Plumwesweep potential. The grade of potash 'samples' so far recovered at Plumwesweep was, he said, 'pretty good.' Some 9,000 tons of 'product' would have to be mined daily to produce 1,000,000 tons per year. At present, potash prices were about $21 a ton. An agreement between Saskatchewan and New Mexico, potash producing areas, resulted in a general floor price being established. Estimates are that potash deposits, in the world, are 20 billion tons. Under heavy cultivation, potash must be put back into the ground. Some 95 per cent of potash is used as fertilizer and the rest in chemicals. At the moment, about 75 per cent of Canada's potash production goes to the United States, Japan and Great Britain, Estimates are that by the 1980's, the supply-and-demand situation will be 'good'. Deposits which were near transportation centres - such as Plumwesweep, near the port of Saint John - stood an excellent chance of being in demand. The long term prospects for salt were also good he stated. Mr. Hamilton was introduced by Dr. Potter as 'the man who conceived, and is close to, the Sussex project.' Mr. Hamilton spoke of salt and produce 'rocks'. They are 'Windsor rocks' and extend from the St. Lawrence area to New Brunswick and then on to Newfoundland. 'Sub- basins' develop, and the Moncton subbasin is one of these. Using a blackboard, Mr. Hamilton described the formation of 'basins'. There was evidence, he said, that at one time Europe and North America were connected. In the Moncton basin, about six per cent of the 'components' were 'evaporates'; and it was the evaporates 'in which we are interested, as they contain the salt and potash. The Sussex area was in the general Moncton basin. Sea water had, long years ago, rushed into this area and evaporated (there is a present day salt water pond on the Plumwesweep property of Mr. James M. Thomson). When sea water evaporates it leaves 'about five inches of salt and one inch of potash.' Mr. Hamilton spoke also of deposits at

Havelock, Turtle Creek, Pollett River and Salt Springs. In one 'well' there were 1,600 feet of salt deposits, and in another 3,000 feet. 'As sea water evaporates, you get great quantities of zinc, lead, copper and other minerals, and you might get a substantial ore body developed.' Dr. Ruitenberg, in charge of natural resources development in southern New Brunswick - an office has been set up by the department in Sussex - was introduced. He had come to New Brunswick, some years ago, for three months, 'but I'm still here and still busy.' He reported that 'our work in New Brunswick has greatly expanded, and although this costs money I am sure it is fully justified.' His department studies rocks, sets up maps and provides the information to mining companies. The mining industry in Canada resulted from the study of, and findings from rocks; with the result an impetus to the economic development of the area concerned. He hoped that, in September, there would be an 'open house' here, with displays of rocks and maps, and by viewing these the public could become interested and well informed. For the last several years, Dr. Ruitenberg has been stationed in Charlotte County. Dr. Hamilton noted that he himself had first visited Sussex some 16 years ago, in the course of his duties. He then introduced Mr. Cummings, resident representative here of Potash Company of America. Mr. Cummings reviewed the international and widespread scope of his company. He spoke of earlier days in the Potash industry in North America, and of present day potash operations in Canada and Carlsbad, New Mexico. 'Our (company's) achievements have been substantial, and we developed the 'flotation process' by which salt and potash are separated. 'Any salt basin is a good place to look for potash, though all salt basins do not have potash. The mineral resources branch of the department of natural resources did a splendid job in providing the structural picture of potential deposits in this area. The work that we (the company) are doing now is to prove the thesis of the resources branch, and then develop.' Mr. Cummings said a number of holes would have to be drilled before it can be definitely established development to proceed with and develop. Following Mr. Cummings' remarks, movies on salt- potash deposits, and the industry, were shown; and, afterward, a question-and-

Codes: O7 / IDX_Names: Salt/Potash - Sussex Area;
Kings County Record - Feb. 1, 1973 Concerted Efforts To Explore Salt-Potash Deposits Pending. - Plan Early Start. - A Denver, Colorado, mining company has signed an agreement with the Province of New Brunswick, giving it the right to explore for salt and potash in the Plumwesweep-Penobsquis area. The agreement, signed by Natural Resources Minister A. Edison Stairs and John W. Hall, president of Potash Company of America, gives the company first option to develop a potash mining and concentrating operation if the exploration program reveals the existence of a commercial deposit. Potash Company is a subsidiary of Ideal Basic Industries, Denver. Potash in the area was first discovered early in 1971 by the provincial department of natural resources during a geological investigation program financed by the federal government. Mr. Stairs termed this program as an excellent example of co-operation between the province and the federal department of regional economic expansion and the department of energy, mines and resources to encourage the development of the province's mineral resources. Two exploratory holes were drilled. The first, at Plumwesweep, revealed potash minerals at a depth of 900 feet to 1,000 feet, and the assay indicated satisfactory ore grade; the second hole, five miles distant, intersected 3,000 feet of high-quality salt without potash. The department of natural resources publicly requested interested parties to submit proposals for the exploration necessary to determine whether commercial quantities of potash exist. Several mining groups made submissions, and the government held lengthy discussions with them last year before selecting Potash Company of America. 'The government hopes that this deposit may be the first of several potash mines in New Brunswick,' Mr. Stairs said. 'Accordingly, care was taken in the evaluation of submissions to ensure that the selected company had the technical ability and experience to explore the deposit carefully and thoroughly. The province also wished to select a company with the necessary engineering and mining experience, financial strength and marketing capability to undertake a major potash operation if exploration were successful.' 'PCA is the second largest producer and marketer of potash in North America with operations in Carlsbad, New Mexico and Saskatoon, Saskatchewan. The company was organized in 1931 and was merged into Ideal Basic Industries, Inc., in 1957. Ideal Basic Industries is one of the world's largest producers of Portland cement, with annual sales of more than $150,000,000. The company has said the entire Sussex area project will be financed without any assistance from the province. 'PCA was the second company to enter the New Mexico potash field, and pioneered the exploration and development of the Sakatchewan potash deposits. The company has 41 year's experience in potash production and has developed strong marketing relationships in North and South America, Japan, New Zealand, Australia and other countries. 'The provincial government is pleased to have attracted a company of such international stature to the minerals industry of New Brunswick.' Mr. Stairs expressed particular satisfaction that the company has agreed, if exploration is successful, to incorporate a New Brunswick company and offer equity participation to the Canadian public to a minimum of 25 per cent. The agreement also obligates PCA to complete its exploration program within two years, and company officials said work will commence immediately. PCA is also required to produce and market a minimum of tonnage within a specified time period and to pay a royalty to the province on minerals produced. Maintenance of the highest standards and environmental protection is also part of the agreement. If a commercial deposit is discovered it is expected that the company will proceed with the development of an underground mining operation, Mr. Stairs said. Experience in developing potash mines indicates that the earliest possible date for production would be 1976-77. Mr. Stairs said he had instructed his staff to work closely with PCA to keep the local community in the Sussex area fully informed on all developments. Until exploration is completed it will not be possible to estimate capital expenditures or staffing requirements but similar operations elsewhere have involved 'an investment of considerable magnitude and direct employment of from 300 to 400.' Potash is found in the form of potassium chloride and is usually associated with deposits of common salt; 95 per cent of processed potassium chloride is used in the production of fertilizers. The major potash deposits in North America are in Saskatchewan and New Mexico, and other major world

suppliers are Russia and East and West Germany. The potash market is presently in a position of over supply, with excessive government regulation of production. It is hoped that the over supply situation will improve by the time any operation in New Brunswick comes into production, Mr. Stairs said."

Kings County Record - Mar. 1, 1973 Begin Drilling Next Week. - Resources Minister Edison Stairs announced at Fredericton Tuesday that a Denver, Colo., mining firm will begin exploratory drilling for potash in the Sussex area next week. The province signed an agreement last month with Potash Company, a subsidiary of Ideal Basic Industries of Denver, giving it the right to explore for salt and potash in the area. Potash Company is the second largest producer and marketer of potash in North America. Potash was 'discovered' in the Plumwesweep - Penobsquis area in 1971 by the provincial department of natural resources. There had been evidence of salt deposits there for many years."

Codes: O7 / IDX_Names: Salt/Potash - Sussex Area;
Kings County Record - Mar. 8, 1973 At Plumwesweep After Some 275 Million Years! - A further news release from the New Brunswick department of natural resources, as to the current salt and potash operations in the Plumwesweep area, states - 'Salt is commonly formed by the evaporation of sea water, or salty lake water. Parts of northern New Brunswick were open to the sea in prehistoric time about 275 million years ago. Undoubtedly the climate was much warmer than now, and rapid evaporation of this sea water resulted in the deposition of salt near Sussex, Upham, Hillsboro, and Dorchester. Potash minerals are usually deposited after all of the salt has been precipitated. 'Salt is much lighter than most other rocks, and after salt deposits are buried they have a tendency to flow upward and form domes or other peculiar shapes. Beds with potash minerals may be highly contorted and in many parts of the world they are too irregular to be mined. 'In 1970, four potash beds were encountered during a drilling program carried out by the department of natural resources. An agreement with the Potash Company of America was signed on Jan. 29, 1973, and this company was to begin drilling on or about March 5. Their program is designed to determine how extensive the potash beds may be, and if they maintain their thickness over a large enough area so they can be mined. The drilling will also indicate the shape of the deposit. Core samples will also be taken and analyzed to determine the grade of the deposit. 'PCA will drill their first holes northwest of the discovery hole at Plumwesweep. They will be spaced at one quarter mile intervals. This will provide them with a cross sectional picture of the deposit. When this information is compiled more holes will be drilled to the east and south so a three dimensional picture can be obtained. Inspiration Drilling, of Bathurst, has been awarded the contract to carry out the initial drilling program. They are one of Canada's largest drill contractors and have extensive experience in this type of work. J.B. Cummings and P. Corbin, of PCA, are in charge of the project, and both have many years experience in mineral exploration.' 'Holes will be drilled to a depth of about 1,000 feet; however, the equipment is capable of much deeper penetration if warranted. Considerable care must be taken during the work, and all holes will be cemented or 'plugged' after the core has been retrieved.'"

Kings County Record - Nov. 21, 1974 Hope Discovery Will Develop. - Hon. Don Jamieson, federal minister of the department of regional economic expansion, and New Brunswick Natural Resources Minister, A. Edison Stairs, have announced that potash and high purity rock salt have been discovered southwest of Sussex. The discoveries resulted from a drilling program by the mineral resources branch of the department of natural resources. The combination of the high quality of the discoveries and their location near rail and highway links to the Saint John seaport is expected to stimulate further exploration by private companies toward possible development of the resources. Development possibilities include salt mining, potash mining, processing of salt and potash, and underground storage of oil and other hydrocarbons. In allowing further exploration, the province will seek to maximize the net benefits which may accrue to residents of New Brunswick from development of these resources. To this end, negotiations are under way with companies interested in developing the salt resource, and consultants have been retained to study underground storage possibilities. Submissions for exploration and development of the potash will be called for at a later date. Activity in the area was stimulated by previous discoveries of potash and salt northwest of Sussex. These discoveries are currently being explored in detail by the Potash Company of America, and, after considerable work, development prospects continue to look promising. In both areas drilling was carried out under a federal-provincial program designed to encourage exploration and development of New Brunswick's mineral resources. The current phase of this province wide program commenced in February 1973 and has a budget of $2.6 million. The program is managed by the mineral resources branch of the New Brunswick department of natural resources. The department of regional economic expansion provides approximately 95 per cent of the program's funds."

Codes: O7 / B8 / GEOL / IDX_Names: Salt/Potash - Sussex Area; Dunsinane Coal; Geology - General;
Kings County Record - Sep. 13, 1945 Geologists Make Surveys In Kings County In 1944. - From the annual report of the department of Lands and Mines of the province of New Brunswick, the report given by Dr. W.J. Wright, provincial geologist, shows that during last year considerable survey work was carried on in Kings County. One party of men under the direction of J.McNeil, made surveys of the salt-bearing areas at Mannhurst, Cornhill and Plumwesweep. Exploration for coal deposits was carried on atDunsinane, where five holes were drilled at intervals within an area of about one square mile, to depths of 181 to 432 feet. Four holes cut coal. There are two groups of seams separated by 10 to 12 feet of shale. The top group varies in thickness from 20 to 32 inches and the bottom seam 24 to 41 inches. Owing to the poor recovery of the coal core it is difficult to determine the actual character of the groups but the conclusion is that they

comprise at least two seams of coal separated by shale. The outcrop of one seam in the 'Smith Pit' shows the following in descending order:- Coal, 7.5', shale 6', coal 8'. It is not known whether this is the top or bottom group. The salt bearing areas of the Cornhill-Mannhurst basins were surveyed and plans are being completed to show the property lines, general geology and locations of salt seepages, drill holes. etc. Samples of brine were collected from Mannhurst, Cornhill, Penobsquis and Plumwesweep. They were analyzed qualitatively in the provincial laboratory by E. Rowley. All samples contain sodium, calcium, and magnesium, and those from Mannhurst, Penobsquis, and Plumwesweep contain potassium. Quantitative analysis was not undertaken because the samples were diluted by varying amounts of rain water."

Codes: O7 / E2 / IDX_Names: Salt/Potash - Sussex Area; Oil and Gas - Kings Co.;
Kings County Record - Sep. 29, 1949 Shell Plans Use Of Heavier Drill. - Shell Exploration New Brunswick Limited is bringing in heavy drilling equipment to continue its search for oil in New Brunswick, it was announced yesterday from the company's headquarters in Moncton. The heavy drill, capable of probing the earth to a depth of 12,000 feet, will be used first near Dorchester, where a test well already has been put down to 5,668 feet. Shell Exploration New Brunswick Limited, which established its head office in Sussex for its first operations, sank two test wells in Kings county before moving to Westmorland county during the spring of 1949. The Kings county wells were at Urney and Apohaqui. The company still maintains Sussex as a supply base. The announcement of future plans said: 'In addition to deepening the Dorchester well with heavy deep well drilling equipment, Shell is commencing drilling shallower tests with the present light equipment. These well will probably be drilled to depths up to 6,000 feet. 'The test well located near Dorchester reached adepth of 5,668 feet at the end of two months' drilling. The top of the main objective of this test, the Albert formation, was reached shortly before this depth was attained, and during the course of drilling a deposit of salt was discovered which is more than 3,000 feet in thickness. The average drilling speed to date has been in excess of 90 feet per day. 'At present, drilling operations are suspended as the equipment on hand has reached its mechanical depth limit, but heavier equipment will be arriving during the coming week to deepen the well. This consists of one of the heaviest types manufactured and will be capable of deepening the well to 12,000 feet should this be necessary. It is equipped with a derrick 150 feet in height with a load capacity of 350 tons. 'The next test will commence drilling this week and is located at Belliveau Village, about five miles northwest of the Dorchester test well. The location has been prepared and drilling equipment is being assembled on the site. 'During the summer, seismic exploration work has been carried out in eastern Westmorland county and during the months of June, July and August a total of 419 shot holes were drilled with a total footage of more than 36,000 feet. In addition to this, a gravity survey has been run over areas of Westmorland County to give additional information for the possible location of test drilling. 'By agreement with New Brunswick Oilfields Limited, an extensive exploration program is being carried out in Hillsborough parish utilizing both seismic and gravity survey parties in addition to a surface geological survey. It is hoped the results of these surveys will be completed late this fall.'"

Daily Telegraph - Apr. 9, 1866 Home Manufactured Salt. - Mr. J.W. Perry, Grocer, No. 7 Charlotte Street, has sent us a sample of the salt manufactured by Mr. James H. Brand, at his salt works, Sussex. The sample before us is No. 1 Extra Fine Table Salt; otherwise we might be induced to present it to His Excellency the Lieut. Governor, to be used in sprinkling the corpse of his defunct government. The article manufactured by Mr. Brand is ""peculiarly adapted for preserving butter, choice meats, etc., having a small quantity of saltpetre in its composition, and warranted free from lime and other deleterious substances"". Persons who have used it assure us that its merits cannot be easily over stated. Mr. Perry is

SPRI / GEOL / Westmorland County Coal; Mineral Springs; Geology - General;
N.B. Courier - Sep. 23, 1837 LETTER II. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May it please your excellency; Having in a former letter, and as briefly as possible, endeavored to give an account of the rocks of the Coal Measures on the west side of Chignecto Bay, and to notice some of their most important characters, I now proceed to the examination of the deposits in the direction of the main road leading from Cumberland to Saint John. There is an inconsiderable ridge of grey sandstone extending from Fort Cumberland in a northeast direction. Along the lower grounds at the base of this eminence it was proposed to open a canal, to communicate with the Bay De Verte; and certainly the situation is most favorable for that object, for advantage may perhaps be derived from a considerable lake, and as the country is low and level, there would be but few difficulties to encounter. Leaving the boundary line between Nova Scotia and New Brunswick

southward, the road passes four miles over the great Tantamarre Marsh, one of the greatest collections of marine alluvium in North America. This alluvial deposit extends from several small lakes,situated some distance in the interior of the country, to the head of Cumberland Basin. It is fourteen miles long, and averages about four miles in breadth. Through it the Tantamarre winds its way to the sea, sweeping forward both on the ebb and flood tide the talus which can no longer find a resting place on the banks of a river brought to its narrowest limits by the constant accumulation thus conveyed. Already surcharged with disintegrated sandstone, the river in times of freshet, sends back to the sea the surplus sediment which is fast accumulating at its mouth, and will in time convert Cumberland Basin itself into an extensive marsh. Had the coasts of Chignecto Bay been formed of granite or any other crystalline rock, the present site of the great marsh of Sackville would have remained unobstructed, and now cease to extend its boundaries; but the yielding sandstone giving away before the action of the elements, has not only furnished the materials of the deposit already made, but continues its steady supplies for situations still remaining open, and ready to devour each particle of siliceous and argillaceous matter as it is carried along by the influx of the sea. Large rafts of timber have been buried in these marshes, trunks and branches of trees were often observed projecting from the bank at the bottom of the river - they have been discovered twenty feet below the surface - even the bones of wild animals have met this kind or interment, and large masses of rock having been transported by the ice, have fallen into the same common grave. All these, and perchance the works of art that may have been lodged in this wide receptacle, may a thousand years hence afford matter for grave speculation to those who will not consider the changes constantly going forward upon the earth. Great numbers of white wild geese formerly frequented these places, but they have long since disappeared, and but few of the grey variety now make them a resting place in the Spring. The alluvial deposits in this part of the country are extremely valuable. The inhabitants throw up dykes and embankments against the sea, and thus convert the soil formerly submersed by every high tide, into rich meadows; notwithstanding large tracts are in a sunken and neglected condition for the want of proper draining. The tide in Cumberland Basin rises about sixty feet at spring tides, therefore it is practicable to drain even the lowest lots, and the tide can be shut out by proper floodgates. The soil in the Parish of Sackville rests generally on new red sandstone. This rock reposes on the sandstone of the coal measures, and affords plentiful supplies to its numerous inhabitants. Westcok, the residence of Judge Botsford, has the appearance of an English manor. It overlooks the great marsh, and head of Cumberland Basin, and the beautiful villages scattered along the banks of its rivers. From the beds of clay interspersed near the surface, the country is well watered. There are also collections of sand and gravel. - The farms are small, and not remarkable for neatness, notwithstanding when viewed at a distance, and with the gentle eminences over which they are spread, they form a most pleasing landscape, and the small clusters of trees still remaining - affording shelter and shade to cattle and sheep - are instances of considerable foresight and taste. From Sackville to Dorchester, a distance of nine miles, the road passes over more elevated land; the grey sandstone of the coal measures often containing the impressions of leaves, and other vegetable remains, is predominant; and breaking out beneath the Court House of the latter village, forms a considerable declivity. At some places the rock is covered with a soft conglomerate and red sand, which afford a less fertile soil than the red marly rock of the lower lands. Dorchester and its river were formerly called Memramcook. The principal village stands on a slope, where several grist and saw mills are propelled by the brook descending towards the river. Looking southward, Shepody Mountains appear lifting their tops far above the rocks of the carboniferous order. Judging from their appearance at a distance they are composed of primary and transition formations; and probably like the Cobequid chain in Nova Scotia, (of which they may be said to form a part), they are the southern boundary of the vast coal district of the Province. The Memramcook river extends in a north direction until its ultimate branches meet those of the Shediac on the Straits of Northumberland. The marsh along its banks is twelve miles long, and embraces four thousand acres. The alluvium here is like that of the Tantamarre, having been derived from the same sources, and collected by the same causes. The upland farm lots all join the marsh, and are well cultivated, forming a broad band down each side of the river. From many points the view is delightful, and characteristic of the Acadian inhabitants, who still retain the French language, habits and costume. Four miles northward of the Court House, there is a bed of limestone interstratified with the sandstone. It would be an excellent auxilliary as a manure, were it applied, and is admirably adapted to the soil of the country, where it has been deposited. Having carefully examined the alluvium of the marshes already mentioned, they were found to contain a much greater quantity of silicious, and less argillaceous matter than those of Hants and King's Counties, in Nova Scotia. These circumstances are readily explained, when it is considered that the marshes of Westmorland are composed of pulverised grey sandstone, while those of the most fertile of the other province consist of disintegrated new red sandstone, which from its containing a greater quantity of marl produces more luxuriant crops. The deficiency of calcareous matter in the extensive marshes of Tantamarre and Memramcook, might however be readily supplied by the application of lime. There are numerous blocks of granite scattered on the surface of this country; from whence they came it is difficult to determine, when so little is known of the geology of the Province. It is most probable nevertheless that they have been exiled from the primary rocks forming the Shepody Mountains, by the force of water which has evidently submerged the country at some remote period in the earth's history. From the bridge over the Memramcook to the Petitcodiac, a distance of ten miles, the sandstones of the coal measures rise to the surface. Here, as in many other situations, the frost, rain, and vicissitudes of the weather, have produced a dilapidation of their strata, and a light sandy soil is mixed with the detritus formed under the more active operations of causes which have long since subsided. The soil thus formed, principally of silicious matter, is by no means productive, and instead of the sugar maple, beech, and yellow birch, the meagre white maple and spruce have here fixed their residence. A number of French families reside on the road, and as is usual with them their farms are small, and their dwellings humble. Arriving at the Petitcodiac river from the eastward, a tolerable high ridge of land will be seen to the northward, and a chain of mountains extending from Shepody appear stretching away to the southward and westward; detached boulders of granite increase in number on approaching this large stream, and collections of fine yellow sand; and beds of clay, may be seen by the road side. This beautiful river, following a serpentine course in a north east direction, turns at almost a right angle at a place called the 'Bend of Petitcodiac', from thence it extends southwest until its branches meet the forked extremities of the Kennebecasis. At the angle thus formed, there is a considerable village, with an excellent landing place for timber, deals, and other productions of the fertile and well populated country in the neighborhood. At high water the scenery is very pleasing, and bears a resemblance to some of the splendid views on the Thames and Mersey, in England; but at low water its imposing effect is lost, and the empty chasm, with its muddy banks, have a disagreeable and gloomy aspect. In this river the tide runs with great rapidity, often opening new channels and sweeping away large collections of sand, and undermining the alluvium produced by its singular powers. So great is the distance over which it must pass in the space of a few hours, that its increasing volume on the flood, particularly at Spring tides, is greater than its speed over the gently inclined 'flats', hence it rolls forward in a foaming tidal wave, sometimes six feet high, sweeping the river with a rush of water like that of a coming deluge. - The effects of such powerful causes appear obvious, in the estuaries of Shepody Bay and Cumberland Basin, where the increasing collection of sand and shingle are undergoing pulverisation to fill more quiet situations with the sinking sediment. Large trees, pieces of timber, and quantities of vegetable matter, drifted from the marshes above, lie buried in these moving sands; wrecked vessels and boats also add to the materials covered in these fearful wastes, over which at high water the largest ships may pass in safety. I have not had the opportunity of measuring accurately the height of the tides in the Petitcodiac, but am of the opinion its highest limits will exceed seventy five feet. Large quantities of marsh on the river have been rescued by dyking, and now yield a plentiful supply of fodder for cattle. The new red sandstone at Sackville, extends in a southwest direction to the ""Bend"", where it is occupied by a number of farms, sloping down the higher grounds on the borders of the marshes to which they are attached. From the Bend of Petitcodiac to Nixon's Inn, a distance of 12 miles, the road extends along the north side of the river. The soil became sandy and light; instead of birch, beech and maple; larch, white and yellow pine inhabit the surface. I have observed that the pine always selects a loose sandy soil, which not only affords it a larger growth, but allows its roots to extend to great distances, thereby affording greater security in gales of wind. The more hardy spruce will 5 send its roots in the narrow crevices of rocks, and cling to a footing where other plants would fall before the breeze. The sand along this road lies directly on the rocks of the coal measures, and often forms collections of considerable depth. On a branch of the Petitcodiac called PollettRiver, and about six miles form the main road, there isan outcropping of coal, which has been intersected by theravine giving passage to that stream. The coal has beenemployed by a blacksmith in that neighborhood, and I regret that I was unable to devote sufficient time, and expense, to ascertain the probable quantity there deposited. I observed a quantity of the argillaceous oxide of iron (clay iron stone) not far from the coal, and it is probable that there is a sufficient quantity of those valuable minerals in the vicinity of this river, at least to support an iron foundry. But considerable time and labour would be required for their full discovery and development. The subsoil in this part of Westmorland is light and sandy, having been derived from the sandstone placed beneath. Blocks of granite, syenite, and porphyry, are common on the surface, and seem to increase in Frequency as the road diverges towards the mountainous land situated a few miles from the coast of the Bay of Fundy. Among the pines I observed a number of red bellied woodpeckers, the Picus Carolinus, a rare bird in Nova Scotia. They are covered with a beautiful plummage, but are very destructive to the groves of pine, as this kind of wood offers but a feeble resistance to the horny beaks of these industrious animals. Between Nixon's and Holstead's Inns, there are some good farms, and instead of the marshes formed by the influx of the sea, The Peticodiac passes through a band of intervale formed in the course of past ages by loose soil, and decayed vegetables, swept down by torrents of rain descending from the neighboring hills. Pursuing its course in a westerly direction, the new red sandstone, four miles northwards of Holstead's Inn, forms a long belt of rising ground called ""Butternut Ridge"", on which there are several new and flourishing settlements. The red marly rock at this place contains beds of limestone, gypsum and rock salt. Several springs take their rise, and send forth large quantities of water highly impregnated with the saliferous mineral. The importance of these deposits to agriculture should not be overlooked, and the design of the Creator of the Universe in supplying salt far from the briny waters of the ocean, and granting lime to enrich the soil are among the exalted acts of his allwise Providence. The limestone contains the remains of numerous shells belonging to the sea. These point out the relative age of the rock, and the peculiar circumstances of its original history. Most of the species of these moluscous animals are now extinct, and their nearest types are only found in 6 tropical seas. In this respect they agree with the plants of the coal fields, which bear the characteristic marks of a warm

St. Croix Courier - May 20, 1875 Important Discovery Near St. Andrews.- At Bay Side, parish of St. Andrews on the lands of Mr. Joseph Mears, a salt or rather several salt springs within aradius of twenty feet has been discovered. The Basin from which these springs originate is of an extensive area, and the flow from the largest orifice is over twenty gallons per minute, the brine yielding full six per cent of chloride of sodium of an excellent quality, equal to the best Liverpool salt. The formation on either side of the basin in which the springs are situated, is of Devonian age, and rises prominently on each side of it. The basin itself is a deposit of marly clay, blue striated and stratified, deposited in a synclinal fold, probably from the ocean. On the shore, at the thin part of the wedge shaped deposit of clay marl, the springs burst through the gravel bottom giving full vent to their flux. Samples have been sent to the United States, and have proved so satisfactory, that a party of gentlemen are to visit the springs with the object of seeing for themselves, and if satisfied with the prospect, to form a company and at once commence the manufacturing of salt. A sample of the salt can be seen

at the office of this paper. It is claimed that it possesses all the qualities required for butter salt. The present sample was hurriedly prepared, but under a slower process the crystallization will be perfect."

Richibucto Review - Sep. 5, 1901 The mining outlook seems particularly bright in New Brunswick, and we trust the experimental work being conducted in the various counties will demonstrate the expected quantities of mineral wealth. In this county the reports of the coal finds in the upper part of the county have raised great hopes of a profitable industry. In Westmorland the boring for oil is going on and in addition to striking a steady flow of good quality oil in the first well, the operations at the second well havedisclosed the first level of oil sands at 100 feet depth giving a strong flow of gas. In Kings County the boring for saline springs, and in Queens and Sunbury the prospecting for surface coal have been reported as moderately successful."

Royal Gazette - Sep. 19, 1888 Notice of Granting Letters Patent.Public Notice is hereby given, that under The New Brunswick Joint Stock Companies' Letters Patent Act, Letters Patent have been issued under the Great Seal of the Province of New Brunswick, bearing date the seventeenth day of September, A.D. 1888, incorporating Robert Wisely, of the City of Portland, in the City and County of Saint John, Chamberlain; William B. Wallace, of said City of Portland, Barrister-at-law; G. Clowes Carman, of the Parish of Musquash, in said City and County, Farmer; Warwick W. Street, of the City of New York, in the State of New York, United States of America, Broker; and T. Clarence Wallace, of Englewood, in the County of Bergen, in the State of New Jersey, United States of America, Cattle Breeder; for the purpose of the sale and purchase of Real and Personal property, and the right to acquire by purchase, lease, or otherwise, the right of securing, raising, getting and working of Mosses and Lichen; the right to prepare, manufacture, ship, deal in Mosses and Lichen for litter and other purposes; the right to buy and sell merchandise, and to carry on a general business in Mosses and Lichen, with all powers incident thereto, by the name of The Moss Litter Company, with a total capital of Two hundred thousand dollars, to be divided into twenty thousand shares of ten dollars each. Dated at the office of the Provincial Secretary, at Fredericton, this seventeenth day of September, A.D. 1888 R.W.L. Tibbits, Deputy Provincial Secretary."

Chignecto Post Dec. 19, 1889 The peat bog at Memramcook - about 70 acres inextent - is being drained, with the intention of testing the material in Boston and other markets for stable bedding and such like purposes."

Moncton Daily Transcript - Dec. 20, 1889 The Memramcook peat bog, some 70 acres, is being drained, and samples are to be sent to Boston and other places to be tested for bedding &c."

S.J. Daily Sun - Dec. 21, 1889 A peat bog at Memramcook - about 70 acres inextent - is being drained, with the intention ot testing the material in Boston and such like purposes."

Evening Gazette - Nov. 25, 1891 and Fredericton Daily Gleaner - Nov. 27, 1891The Moss Litter Company held its annual meeting yesterday and adjourned for two weeks to get a full report on the machinery. It is understood that the machinery has proved to be on the correct principle and it is merely a matter of a few days or weeks to get the litter in the market in large quantities. A large shed has been erected near the bog to enable the operations to be carried on during the winter. W.F. Todd and C.E. Boardman, of St. Stephen, visited the works at Mossbank yesterday and inspected the works, which ran very smoothly. Messrs. Todd and Wallace are to be congratulated on having at last got the works so that they can be sure of success."

S.J. Daily Sun - Dec. 21, 1893 A Moor of Sphagnum Moss. - A Field for New Brunswick Enterprise. - I had occasion during the summer to visit the little settlement of Shippegan, the terminus of the Caraquet Railway, and thereby hangs a tale of interest as illustrating the natural resources of New Brunswick. As we neared the end of our journey we found that the railway traversed for a mile or more a treeless moor, a vast deposit of sphagnum moss, an article which is coming rapidly into use as well for the purposes of litter as for those of deodorisation. The area covered by this moor seemed to be between 800 and 900 acres; it was on a peninsula, which at its narrowest point appeared to be not more than half or three-quarters of a mile wide. Shortly after arriving at Shippegan, having made the acquaintance of the Rev. S.J. Doucet, the parish priest, a learned and accomplished man, we concluded that we would drive three miles out to the moor and make an examination of it. On our arrival we found it pre- eminently a true sphagnum moss, of which moss there are at least twelve varieties in New Brunswick. The centre of the moor appeared to be about eight feet higher than the sides. We also found the litter to be of an exceptionally good character; and, seeing the proximity of the moor to the sea on either side, it could be easily and cheaply drained. Hence we both came to the conclusion that, under the bright sun and beneath the drying winds of the Bay of Chaleur, where there is so little fog, the litter could be quickly dried and prepared for market. A few days after my return home I received a letter from the Rev. Mr. Doucet, in which he said that he had again examined the moor in many places, taking up the sphagnum remains from points a foot or two beneath the surface, and that the water

which was squeezed from the moss was invariably pure and tasteless. He also said that he had caused a pole to be thrust down in several places to a depth of six feet in the moss, and that on being withdrawn it showed no dirt or mud on any part. He further informed me that he had taken a certain quantity of the litter from the moor, weighed it, and then left it exposed to sun and air for ten days, at the end of which period, on reweighing, he found that it had lost by evaporation nearly three quarters of its weight. Of all the articles made use of in stables for beds, or as absorbents, sphagnum moss is, owing to the structure of its cells, the best. It not only absorbs liquids greedily, but has also the power of fixing noxious gases. Prof. Fletcher of Bremen, in his pamphlet on moss-litter, states that he was present at a session of the Central Moor commission in Germany at which there was placed on the table in the room a box filled with a mixture of fecal matter and moss-litter dust. This remained on the table for several hours in the presence of the company without the least disagreeable odor being produced therefrom. In 1890 there were thirty manufactories of moss- litter in Germany alone, the output of which has been placed at 1,300,000 cwt. Part of this output was exported to Great Britain and America, while some went even to Australia and the East Indies. Edward Jack Fredericton, New Brunswick."

Gazette - Oct. 2, 1893 Moss Litter. - That moss litter, especially the dust from it, (Torf-mull) forms a most efficient means for deodorizing bad smelling places in a very short space of time, has long been known, this property as well as its absorptive powers, point to it as a vehicle for rendering easily transportable the fecal matter of cities, for which purpose, indeed, it is being eagerly used in certain cities of Europe. Dr. Fleischer, Director of the Experimental Moor Station at Bremen, states that he was present at a sitting of the Central Moor Commission, in which an open box containing a mixture of fecal matter with moss litter dust was placed on a table in full view of the company, where it remained for some hours without the least disagreeable effects therefrom being noticed. As bacteria or disease germs can only be propogated when moisture is present, moss litter will undoubtedly serve as a check in their extension. Moss litter dust has also been used in bandages for the treatment of wounds. Besides its use for horse stables it can be made use of as bedding for cows and in hog pens and hen houses, thereby purifying the air and at the same time forming one of the very best fertilizers, a fact which is self evident from the well known asuidity with which this article seizes upon nitrogen, the most expensive element which enters into the composition of a complete fertilizer. Moss litter fertilizers are readily bought up by gardeners and other agriculturalists in Europe, when ever they can be had. The removal of fecal matters from certain cities in Europe has been from this fact made a profitable instead of a costly matter. As kainit (one of the salts of potash) which is largely used as a fertilizer in Europe has a tendency to harden into lumps, this is prevented by the addition of moss litter dust. Moss litter affords an excellent article for all kinds of packing purposes and its qualities under it are of the very best materials for the filling of mattresses. The writer has seen moss litter in New Brunswick so clean that when taken from its bed, and the water squeezed from it the latter was so pure that it not only was perfectly clear but when drank was free from any taste. In the preparation of ice houses moss litter can be used to the greatest advantage. In Italy it has been used for the purposes of filtering oil. As to its preservative powers it may be mentioned that at the Moor exhibition held about the last of July 1889 at Magdeburg, potatoes which had been dug the previous year were exhibited which yet retained all of their original freshness and did not show any signs of sprouting or of decay. Many other instances of the preservative power of the moss litter have been observed. Thus a heap of it was made under a pear tree in Germany during the autumn, when the pears were being gathered, some of them fell on the moss and were buried up in it. During the next spring when the litter was being removed these pears were taken out looking as fresh as when they had first fallen from the tree, although they were of an early variety of fruit, which under ordinary circumstances would only keep until Christmas. Fresh caught sea fish packed in moss litter were sent from the Adriatic sea to Stockholm, where they arrived after an 18 days voyage, as fresh as when taken from the water. The experiment was repeated and the sea fish, packed in the same material, was sent from Stockholm to the general assembly of the Moor Kulturvereins at Berlin. Which also after six days journey, to the surprise of all present reached its destination in a perfectly fresh condition. Edward Jack."

Gazette - Sep. 27, 1893 Moss Litter. - A short time since being desirous of knowing to what uses moss litter could be applied, the writer asked Thomas McFarlane, the well known and able dominion analyst, what literature on this matter was to be had in Germany, and was informed by him that the subject had been treated of by Dr. Carl Furst of Kissengen-on-the-Main, Professor M. Fleischer of Bremen, and O. lunger of Copenhagen, and it is from these writers whose works have not yet been translated into English, that the greater part of the information herein now contained has been derived. Thirteen years ago two men seated in a restaurant in Hamburg were talking about the bad condition of the turf business, one was a Swede, the other a German; the latter remarked that the bright fibrous turf was especially difficult of sale, at this the Swede observed, that turf of that kind in Sweden was sometimes used as litter and the dust from it for the absorption of feces. This conversation lead to an inauguration of a new industry. The German, whose name was Hollman, seized upon the idea, connected himself with capitalists and in the year 1880 erected at Gifhorn in Hannover, in what had formerly been a glass furnace, the first establishment used for the manufacture of moss litter. Shortly after Hollman's manufactory was erected others were built at Bremen, Oldenburg and in east Friesland. During the poor straw year of 1881 ready sales were made, and the business became very profitable. This encouraged many moss owners to erect factories so that the number of these soon exceeded 70. Subsequently, however, owing to improper locations these decreased to 30 in 1890; and most of them are to be found in Oldenburg and Hanover, but in spite of this set back the yearly production of moss litter in Germany is very great. Rothbart estimates in that year at 1,300,000 hundred weights, which is itself is a good proof of the extraordinary value of the article in the various uses to which it is being applied. This great production is

used partly in Germany, partly in England and America, while some of it is exported to Australia and the East Indies. Besides Germany and Holland, Sweden takes an important part in this industry. There were 12 manufactories of it there in 1890. In England also, where the use of moss litter has become so common, several manufactories, especially in Yorkshire, were in operation during that year. The property which above all others renders turf so valuable as a litter is the power of absorption which it possesses. This is very different in different kinds of turf. While some of it which has been dried in the air containing 20 per cent of water will absorb twice its own weight, there are other kinds which will absorb even to 20 times their own weight. This difference arises from the structure of the turf, partly from its botanical constitution and partly from its degree of decay (vermoderungs grade). The more the turf is decayed the less fluid will it absorb. The bright, light fibrous, little decayed turf, which forms the upper layers of many moors, has a greater absorptive power than the dark heavy turf which is adapted to heating purposes only. The botanical character of the moss is, however, the matter of greatest importance. We find in the first rank turf formed from Sphagnum moss, of this plant there are at least twelve varieties in New Brunswick. The enormous absorptive power of this moss arises from the fact that the leaves and outer covering of the stalk is composed of large empty cells, which, owing to a number of minute pores in them can fill themselves with water. The inner side of the cell wall is provided with circular or spirally formed thickenings which prevent the collapsing of the cell when it is empty, so that it is always ready to absorb water by means of the pores, or little holes above mentioned. The chlorophye occupy but a small part in the structure of this plant. By means of this capillary apparatus the sphagnum plants are in a condition to raise water to their highest points even when these are above the water level, this renders the sphagnum the most important of all turf building mosses. Through the interweaving or, as it is called in German, the feltering of numerous plants, then further arises a net of water absorbing tubes which act in a similar way. Sphagnum mosses form the chief element in the high moors and show themselves as constituting the whole structure of the turf and where the cell structure of the plant is retained, there is also the absorptive power of the once living plant retained. The absorptive power of the turf is also dependent on the fineness of its division. C. vonFeilitzen at the experimental station in Ionkoping in Sweden has made some interesting experiments in this matter. The result of these are as follows: 1. Turf torn to pieces, in large lumps by hand, absorbed 16.36 times its own weight of water. 2. Turf which had been passed through somewhat finer sieve took up 18.83 time its own weight in water. 3. Turf which had been passed through a still finer sieve absorbed but 14.05 times its own weight of water. Thus it may be seen that the absorptive power increases until a certain point of fineness in the division is reached, but that after this is passed the power of taking up

Codes: P6 / IDX_Names: Peat - General;
Gazette - Sep. 28, 1893 Moss Litter. - In power of absorption is the most important factor in the value of moss litter. This is determined by weighing a certain quantity of the article, which is then placed in water and allowed to remain there three days. It is then taken out and laid upon a wire netting or other support which will allow the water to drain as freely as possible from it; when all the drippings cease it is removed and again weighed. The difference in weight gives the absorptive powers of the article. The absorptive powers of straw is for less than that of moss litter, since it will take only from 2« to 3 times its weight of water. The use of moss litter greatly decreases the quantity of carbonic acid in stables as compared with that of common straw litter. This has been well proved by experiments, very carefully carried out by Regimental Veterinary Surgeon Arnold, in Germany. Twice as much carbonic acid was found in stables in which straw was used as a litter, than was met with in those in which moss litter was made use of. The powerful attractive power of moss litter, as regards nitrogen as contrasted with the use of straw for bedding, is well shown by a series of accurate experiments made at Hanover on specimens of air taken from stables similarly situated, in one of which moss litter was used, in the other common straw. Moss Litter 1 Day 0 grams of ammonia. 2 Day 0 grams of ammonia. 3 Day 0 grams of ammonia. 4 Day 0 grams of ammonia. 5 Day Trace of ammonia. 6 Day 0.0010 Straw 1 Day 0.0012 grams of ammonia. 2 Day 0.0028 grams of ammonia. 3 Day 0.0045 grams of ammonia. 4 Day 0.0051 grams of ammonia. 5 Day 0.0153 grams of ammonia. 6 Day 0.0168 grams of ammonia. In Germany the moss is dug or cut late in the autumn, on the ground where it is exposed to the winter's frost, whereby the subsequent process of drying is greatly accelerated, and the properties for which it is used are thereby also much improved. In early spring the wind and sun effect a rapid partial drying of the clods of moss. So soon as they are half dry they are placed in hollow piles, so that the air can have as much effect upon them as possible; here they are allowed to remain until completely dried. In moss litter operations particular attention must be paid to the previous draining of the bog; thus the drying process will be indirectly aided, and the question as to whether and how this can be most effectually done in the cheapest manner becomes a very important consideration in the value of a peat moss deposit, as also is the question of ready means of transport by rail or water communication. Bogs situated at a distance from there must be of little value, for the purposes of export can only be made use of locally. After the clods of moss are dried they are broken up. To do this work different kinds of machines are made use of according to the greater or less quantity required; for domestic use machines are hardly needed. Where much litter is required a machine furnished with bent iron teeth is made use of. It can be driven by hand, horse, or steam power. The tearing up is effected by a verticle roller armed with such teeth. The turning of this roller reduces the moss to a proper size and it falls through the lower end of the vessel by which the roller is encased ready for use. This machine is called a Reisswolf; they are manufactured by R. Dolbery in Rostock at a cost of from $63 to $225 with a capacity of from 36 to 1000 hundred weight per day. Several systems of pressing moss litter are in vogue in which, either hand, horse or steam power can be used. A hand press costs in Germany $125, it will average per day about 40 bales of three hundred weight each. A steam press costs there $313; this will average from 60 to 90 bales per day of the same weight. These machines are also manufactured in Restock as well as at the Laneburg iron works. It may be mentioned here that when large quantities are

being produced a shaking sieve is made use of in connection with the Reisswolf or Turf mill; this answers the purpose of separating the fibres from the dusty part, the former producing moss litter, the latter turf dust (Torfmull). Application In Stables. The litter should be spread from 4 to 5 inches deep, at first it might be covered with a little straw so as to accustom the horses with its use; at the expiration of 14 days this litter should be removed and replaced by a fresh article. The benefits of moss litter in the stable are many and various, by it absorption of fecal matter all disagreeable smells are prevented and vermin which are attracted thereby also to a very considerable extent disappear. Many of the diseases to which horses and cattle are subject are caused by the impure air in which they are forced to stand during a great part of their lives. The animals which are under the charge of man require for full enjoyment of health, pure air just as much as the man himself does, and what man could expect to retain his health were he required to spend as much of his time under similar circumstances in his dwelling as we require our cattle to do in theirs. Dr. Krenzhage made, not very long since, some very carefully carried out experiments as to the benefits to be derived from the use of moss litter in stables and reached the following conclusions. 1. Moss litter offers horses a better and softer bed than straw, and when well laid, it does not scratch the horses as done by straw. 2. That moss litter is much better for the hoofs of horses standing upon it than straw. Commander Von Troesche of one of the East Prussian Cavalry regiment reports as the result of his examinations, the fact that horses standing on moss litter keep their bodies and hoofs cleaner than they can possibly do when standing on straw, and Dr. Born, veterinary surgeon, after 5 years experience in the stables of the Berlin horse railway, expresses a similar opinion; he also finds from his own experience that the occurrence of hoof diseases in horses which stand on moss litter is 30 per cent less than in those which stand on straw and that the growth of the hoof is greatly aided by the use of moss litter. Edward Jack."

Codes: P6 / IDX_Names: Peat - General;

Daily Sun - Dec. 29, 1894 Moss Litter. - Works Established on the Hill Overlooking Millidgeville. - Considerable interest attaches to the works built during the past summer on the hill overlooking Millidgeville, on what is known as the Caribou Plains, a moss bog forming part of E.H. Turnbull's Alderbrook stock farm, on the road leading to the Milkish fernery. These works were erected to prove the value of a process for the manufacture of moss litter by steam, patented by T.C. Wallace of this city, who has given his time for some years to the endeavour to solve the problem of pressing the water from the moss. The process has now been proved correct and the operation has passed beyond the experimental stage. The plant used was intended for summer working, and as the cold weather approached it was found necessary to adopt some moderate form of air drying to make the moss fit for immediate use, as a small percentage of moisture remaining, scarcely noticeable in summer use, is liable to freeze in a cold stable in winter. The success of Mr. Wallace's discovery and venture is of great importance to the province, which has large deposits of the moss generally considered useless here, as the moisture prevailing in the air in the vicinity of the Bay of Fundy, where the most available bogs are located, render the German method of open air drying scarcely profitable. In a bog of fair depth, with good drainage, it seems quite feasible to work the moss in winter, as it rarely freezes more than sixteen inches below the surface, and it is not uncommon to get a depth of moss ten feet or more. The Alderbrook bog has so far shown about seven feet of good moss, and has been drained by a covered frost proof drain leading from the heart of the bog to the Kennebecasis River below. On the bog a high brush fence has been erected to gather the drifting snows and protect the diggers from the cold winds. This forms an enclosed field in the bog and thence leads along a tramway to the works a few hundred yards away on higher ground. The cars which run on the tramway are novel and are the invention of Mr. Wallace. They are constructed of black iron pipe and the ordinary fittings to be procured for pipe. The carrying part of the cars is constructed of light iron and wire netting in the form of semi-circular trays, which swing to facilitate dumping. There are four trays to each car, varying in size to conform to the round of the steam tank. The moss is cut into brick- shaped pieces with a peat knife and a small sharp spade, and when loaded upon the cars is run to the buildings, where the car, with its load of about 1,500 pounds of wet moss, weighing about 62 pounds to the cubic foot, is run into the steam tank, which is then closed tightly and steam turned on until the gauge shows that a proper temperature has been reached to ensure that every particle of the moss has been subjected to pressure. The object of this is to cause the bladders or cysts in which the water is held to expand and open so that it is liberated. This operation takes about ten minutes or less, but that time may vary according to the pressure of steam coming from the boiler, and then the car is run out, dumped and switched off on an automatic switch to allow another load to come up and take its place to be similarly treated. The whole car load of treated moss is dumped into one end of a double-ended horizontal screw-press invented by Mark Wright of Charlottetown and improved by the St. John man. The press is so arranged that the moss is enclosed in sacks between travelling headers, of which there are four in each end of the press, and being set about eight inches apart, make forty inches of moss in the press, which is about three feet by twenty inches in cross section and forty inches travel. The doors being closed, the plunger forces these five sections of moss towards the head, releasing a flood of hot water, and as it goes forward the other end of the press opens to receive the other carload of moss in a similar manner. When the pressing is finished on one end the screw reverses and while the screwed moss is being taken out another carload is put in the opposite end of the press which performs its work on the second load and so on. When the moss is taken from the press it is still hot and apparently dry, but as it cools a little, moisture is noticeable, so it is then put through a picker and subjected to an air blast. The blast may be cold in summer, but for the winter heated air is better if the moss is intended for immediate marketing. The amount of steam used is not great and the power used to drive the press is surprisingly small. Some chain carriers and more steaming apparatus are to be added to the plant before it is put regularly to work for steady running, as the present capacity of the tanks is not equal to that of the press. Apparently Mr. Wallace has hit on a very simple, yet effective

Codes: P6 / IDX_Names: Peat - General;
S.J. Daily Sun - May 16, 1894 Moss Litter. - Investigations That Might be Instituted in This Province. - The Swiss Naturalists society, some two or three years since, undertook the investigation of the turf-moors and swamp districts of Switzerland, and with this object in view issued a little pamphlet containing various enquiries regarding them, to which answers were requested. They were to be written on interlined blank sheets, and the answers would thus appear on the page adjacent to the queries. From one of these pamphlets which was kindly sent the writer from Munich by Mr. Ganong, of Harvard, but who is at present in the former city, the following extract is translated: Different states have not only caused geological maps to be prepared showing their rock and soil formations, but have also caused special investigations to be made regarding their moors from a practical stand point, as regards the production of fuel and of litter materials, conditions for draining, transmutation of the moor into cultivable land; as also for the purposes of obtaining numerous scientific facts. With this end in view, the Swiss naturalists' society has appointed a commission for the examination of the Swiss turf moors and swamp districts. The commission was composed of Dr. I. Fruh, Prof. Dr. Schroeter and Dr. F.G. Stebler, who date their queries from Zurich. In the preface to their pamphlet they call on the Swiss naturalists for aid, as well as on the friends of farming and forestry. These inquiries embrace several sections. The first relates to the natural history of the moors, such as their topography, condition, basis on which they rest, remains of vegetable or animal matter found in them, plant covering, their special flora, occurrence of sphagnum, growth of plants in the vicinity; the formation of turf-moors, reproduction of turf, temperatures of the turf water, springs, the occurrence of combustible gases and the origin of the moor. The second section refers to the economical importance of these moors, and questions are asked as to the uses to which they are put, as respects farming and forestry; what attention is being given to their draining; at what time the moss is cut or dug; what is the average product per acre; if sold, what price does the product realize; can the use of moss litter be much increased in any district by giving attention to the matter? It would seem to be very necessary that New Brunswick, with its extensive moors, which is one of great importance, and it might be well if our agricultural department found out from the experimental farm at Ottawa what has been done in the matter of experimenting respecting the uses of turf-moss, both for bedding and as a fertilizer, with a view to the publication of such facts in some of our leading journals for the people's use. In looking over 21 analyses of moss litter from northwest and northeast Germany, the writer found that five specimens gave the following percentage of nitrogen respectively, namely: 1.78, 1.03, 1.06, 1.29 and 1.11. From this one can see at a glance of what value this article, when properly treated, will be to our farmers. The Natural History Society of St. John, which has already done much for New Brunswick, might be induced to give its attention to this matter of moor investigation, as some very large ones are situated near St. John and are readily becoming accessible by rail. Leading botanists connected with the society, such as G.U. Hay, might bring their aid to this matter. An excursion of a commission to be appointed by the society, with somewhat similar instructions to those given by the Swiss Society, might be organized during the coming autumn, having in view the visiting of some of our moor districts, and their report would be sure to direct the attention of the public to the matters reported on, and there is no doubt but that very beneficial results would follow its publication. Edward Jack, C.E. Fredericton, May 10, 1894."

St. Andrews Beacon - Oct. 31, 1895 Edward Jack has sent samples of moss litter procured from a bog near Rusagornish Station (Fredericton branch railway) to a German expert, and has received a very favorable analysis."

Daily Sun - Nov. 11, 1897 The Late Edward Jack's Idea. - A Toronto despatch says: In the report of 1893 the Bureau of Mines contained a paper by the late Edward Jack of Fredericton, N.B., who was an enthusiast on the matter of peat moss as a substitute for cold storage. He told of the results in Germany, where fish packed in peat moss for a fortnight were found to retain their freshness, and delicate and perishable fruits were found to retain all their qualities. It now appears that the report has borne fruit. The Bureau of Mines has received word that a shipment of perishable fruit sent to England from Canada by Alex. Jardine showed the immediate utility of peat moss. Its tremendous absorbent qualities render it a great

St. Andrews Beacon - Nov. 11, 1897 Peat Moss vs. Cold Storage. - The Ontario government has received word that the shipment of perishable fruits sent to England from Canada according to the plan formulated by the late Edward Jack, of Fredericton, N.B., arrived in splendid condition, proving the soundness of his theory. The story is as follows: The official report of the department of agriculture for 1893, contained a paper by Mr. Edward Jack, who was an enthusiast on the matter, of peat moss as a substitute for cold storage. He told of results in Germany, where fish packed in peat moss for over two weeks, were found to retain their freshness, and delicate and perishable fruits retained all their qualities. This shows the immense utility of peat moss. Its tremendous absorbent qualities render it a great antidote to atmospheric yeasts and bacteria, which bring about decay. The supply throughout Ontario is estimated as sufficient to last ten thousand years, even though very widely used, and if results continue to be good, the shipment of Canadian perishable

S.J. Star - Sep. 27, 1902 Peat For Fuel. - Plant Near Ottawa Will Produce 100 Tons Per Day. - Why Should Not New Brunswick Peat Bogs be Utilized. - ..."

Codes: P6 / IDX_Names: Peat - General;
Granite Town Greetings - Nov. 11, 1908 That peat in very large quantities will eventually be used as fuel in western Canada, as well as in the eastern part of the Dominion is the opinion of J.A. Macoun, expert of the Geological survey. Mr

Macoun has just returned with his assistant, from a trip over the line of the Canadian Northern."

St. Andrews Beacon - Nov. 12, 1908 Charlotte's New Member. - ? Todd, was born in St. Stephen in 1854, the youngest son of the late Freeman H.Todd. ... Mr. Todd became financially interested in the development of the peat beds in eastern Charlotte and has devoted very largely of his time towards that end. As yet machinery for the proper preparation of peat as an article of commerce has not been perfected and this enterprise has not been brought to the successful fruition that

Evening Times-Star - Jun. 2, 1910 The St. Andrews Beacon says: - 'The government istesting the peat deposits in Ontario, with a view to discovering the value and cost of the article as fuel. It has been found that it can be turned out in marketable shape at $1.75 per ton. There are extensive peat deposits in Charlotte and St. John counties; and there is no reason why they should not be made available as fuel.'"

Evening Times & Star - Jun. 8, 1910 Fuel From Peat. - Addressing the Natural History Society last evening, Mr. William McIntosh expressed the view that New Brunswick had in her peat bogs a natural asset of greater value than her coal deposits. Mr. McIntosh spoke in an interesting way of what is being done in some other countries to utilize peat for fuel. It was stated the other day that the dominion government was so well satisfied with its experiment of converting peat into fuel that similar experiments might be conducted in other parts of the country. This, as has been remarked by the Times-Star is of interest to New Brunswick. There are valuable peat bogs in St. John and Charlotte, and perhaps other counties. The experiment that has been carried on by the government has proved that peat from its bog of 300 acres could be laid down at the railway station at $2 to $2.25 per ton. Between 200 and 300 tons of peat is now drying. Discussing the scarcity of coal and wood in some parts of Canada, and the importance of utilising the peat deposits, Dr. Haanel recently said:- 'Considering the fact that we imported during the year 1908 coal to the value of $2,850,000, constituting an enormous and increasing drain on the wealth of the country, every effort should be made to retain a portion of the money at home, not only to give employment to our own people, but to loosen our dependency upon outside sources.' Dr. Haanel also indicated that the known peat bogs of Canada covered around 36,000 acres; and that such an area would produce 28 million tons of air-dried peat, which would be equal in value to fourteen billion tons of coal."

Daily Times - Aug. 17, 1929 Peat Litter in New Brunswick. - The Geological Survey Department at Ottawa says: The time seems ripe for the establishment of a peat litter industry in Canada. Large quantities of manufactured peat litter, peat mull, and insulating material made from peat litter are imported annually into Canada from Germany, Holland and Sweden. According to Mr. A. Anrep of the Geological Survey, peat litter and peat mull of a quality equal to and in most cases superior to that which is imported into North America from Europe is found in great abundance in the peat bogs of Canada, and there is reason to believe that there are great possibilities for the development of an industry on a commercial scale. Bogs containing high grade peat litter, thousands of acres in extent, occur in Kent, Northumberland and Gloucester counties in the Province of New Brunswick and in Kamouraska and Temiscouata counties in the Province of Quebec. There are also extensive peat litter bogs in the Fraser River delta of British Columbia, and numerous smaller bogs in the Province of Nova Scotia, New Brunswick and Prince Edward Island. As many farmers know peat litter is extremely valuable as an absorbent of liquids and gases when used as bedding for horses, cattle and pigs, and the finer quality is used in poultry houses and as bedding for young stock. The finely granulated material imported, which is either specially prepared or consists of the residue of fine particles from the screening of the coarser litter, is called peat mull. It is used in Canada and the United States as a mulch or is incorporated with the soils of greenhouses and gardens. It is also used for packing perishable fruits. Insulating material manufactured from specially treated litter is used in the insulation of walls, floors, and roofs of buildings, refrigerator plants and storehouses. At present two small plants for the manufacture of peat litter and mull are under construction in Canada. One of them is situated on a 150 acre bog a few miles from St. Stephen, New Brunswick, and the other on a 100 acre bog a few miles from New Westminster, British Columbia. It is expected that both of these plants will have litter and mull ready for the Canadian market this autumn."

St. Croix Courier - Aug. 22, 1929 Development of New Brunswick's Peat Bogs. - Operations of Company at St. Stephen Attract Editorial Attention From the New York Sun. - Some Uses for the Product, Which Has A Wide Market. - (The New York Sun, Editorial, Aug. 5th, 1929). - [see Daily Times - Aug. 22, 1929] ..."

Codes: P6 / IDX_Names: Peat - General;
Daily Times - Aug. 22, 1929 New Brunswick Peat Bogs. - Development work at the peat bog deposits near St. Stephen, in this province, is attracting much attention and this novel industry may reach considerable importance. The New York Sun gives it editorial prominence in an article which appeared in a recent issue. The New York paper says: 'Peat is popularly associated with Ireland, in which country peat bogs are unusually plentiful and poets abound to sing of its fumes. However, imports of German and Dutch peat moss at North Atlantic ports have been increasing in response to the demands of American florists and landscape gardeners. Now Canada is entering the industry. A company backed by American and Montreal capital has been formed to exploit bogs near St. Stephen, New Brunswick, and to ship moss. 'In addition to use in floral work, the moss is employed in making new lawns. Peat bogs covering about 228,000 acres are situated in all parts of eastern Canada. The plant at St. Stephen is nearly completed and it is estimated that shipments will amount to 5,000 tons annually. 'Peat - or bog - moss, also known as sphagnum, was gathered and prepared in large

quantities during the world war by voluntary workers for use as a surgical dressing. Its highly absorbent qualities make it especially valuable for this purpose. Peat consists of the remains of sphagnum together with partially preserved remains of vegetation swamped and killed by its overgrowth. It owes its preservative power to its content of humic acid. 'During the latter years of the great was peat came into greater use as a fuel, due to the scarcity and cost of coal, and this augmented use has continued since. Bacterized peat is now manufactured into blankets, carpets, rugs, wadding, paper and cardboard, and also produces peat gas for power purposes. It is also largely used in the cultivation of bulbs and other plants. The United States has vast peat deposits; it is estimated that, excluding Alaska, there are 12,888,500,000 tons available in this country.'"

St. Croix Courier - Jul. 18, 1929 Local Company Formed to Develop Peat Moss. - Hon. W.F. Todd Prime Mover With Outside Capital Interested. - Plant Almost Ready For Operation Near St. Stephen. - A company has been incorporated in New Brunswick to exploit peat bogs in the vicinity of St. Stephen and ship peat moss. U.S. and Montreal capital is stated to be interested in the undertaking and one of those actively working for the development is the Hon. W.F. Todd, former Lieutenant-Governor of New Brunswick, who owns a moss bog of about 150 acres a few miles from St. Stephen. Application for leases of barrens and bogs where peat is available elsewhere in the province was sought for and the Provincial Government, anxious to encourage the proposed industry, granted those requested with but certain restrictions. The prime movers in the enterprise are those who have lately been co-operating with the Dominion Government in the work upon the peat bog at Alfred, Ontario, calculated to definitely and conclusively prove the feasibility of the commercial operation of such bogs, and marketing the fuel. The object of the new development is to replace the present voluminous importation of moss from Holland and Germany into Canada, which, it is claimed, should be effected without difficulty since the Canadian product is superior to that brought into the country. At the same time, the United States is a much heavier importer from Europe, and it is hoped to be able to establish the Canadian product on that market. The plant at St. Stephen is nearly completed and operations are to start soon. Shipments are expected to amount to 5,000 tons per season, to start moving this year. While there will be a certain local consumption, it is expected that the bulk of the product will go to Montreal, New York and Boston."

St. Croix Courier - Mar. 7, 1929 To Develop Peat Fuel On Large Scale. - Hon. W.F. Todd Incorporates 'Peat Moss Products, Ltd.' - To Develop Peat Moss Products in New Brunswick. - Fredericton, N.B., Feb. 27th, 1929. - Notice appears in the Royal Gazette today of the incorporation of Peat Moss Products, Limited, for the purpose of manufacturing, producing and dealing in peat, peat moss, peat fuel, and other products of peat and peat moss. If the plans of the incorporators go through the development of large peat areas in New Brunswick, in connection with which Hon. W.F. Todd, former Governor of New Brunswick, has been actively interested for some years, will soon be actively underway. The new company has an authorized capitalization of $100,000, and recently former Governor Todd appeared before the Government of the Province seeking a grant of leases of barrens and bogs, where peat is available, located largely in the counties of Gloucester and Northumberland on Crown Lands. The Government have made known their desire to assist the proposed development by granting the requested leases, under certain restrictions, and otherwise so far as possible."

Codes: P6 / IDX_Names: Peat - General;
Telegraph Journal - Oct. 18, 1929 Time Now Ripe For Establishment of Peat Industry in Canada. - Huge High Grade Bogs Are Found In New Brunswick. - Federal Department of Mines, Geological Survey, Tells of Opportunities. - St. Stephen Plant Now Being Built. - Peat Products Are of Great Value For Farm Use. - In connection with activities for development of peat areas in New Brunswick, the following, which is issued by the Department of Mines, Geological Survey, Ottawa, is of interest: 'The time seems ripe for the establishment of a peat litter industry in Canada. Large quantities of manufactured peat litter, peat mull, and insulating material made from peat litter, are imported annually into Canada and the United States from Germany, Holland and Sweden. According to A. Anrep, of the geological Survey, peat litter and peat mull of a quality equal to and in most cases superior to that which is imported into North America from Europe, is found in great abundance in the peat bogs of Canada, and there is reason to believe that there are great possibilities for the development of an industry on a commercial scale. 'Bogs containing high grade peat litter, thousands of acres in extent, occur in Kent, Northumberland and Gloucester counties in New Brunswick, and in Kamouraska and Temiscouata counties in quebec. There are also extensive peat litter bogs in the Fraser River delta of British Columbia, and numerous smaller bogs in Nova Scotia, New Brunswick and Prince Edward Island. Litter Valuable. - 'Peat litter is extremely valuable as an absorbent of liquids and gases. Of the material imported, the most coarsely granulated is used as bedding for horses, cattle and pigs, and the less coarsely granulated is used in poultry houses and as bedding for young stock. The finely granulated material, which is either specially prepared or consists of the residue of fine particles from the screening of the coarse litter, is called peat mull. It is used in Canada and the United States as a mulch, or is incorporated with the soils of greenhouses and gardens. It is also used for packing perishable fruits. 'Insulating material manufactured from specially treated litter is used in the insulating of walls, floors and roofs of buildings, refrigerator plants and storehouses. 'At present two small plants for the manufacture of peat litter and mull are under construction in Canada. One of them is situated on a 330 acre bog a few miles from St. Stephen, N.B., and the other on a 100 care bog a few miles from New Westminster, B.C. It is expected that both these plants will have litter and mull ready for the Canadian market this autumn.'"
North Shore Leader - Sep. 21, 1951 Peat Moss Industry Affected By Rains. - Shippegan. - An abnormally heavy rainfall experienced on the North Shore of New Brunswick this summer has harmed a local industry which in past years has

provided a welcome source of income for this part of the province. Hard hit by the rain was peat moss industry, one unique to this northern Region of New Brunswick. The moss, a form of seaweed, is raked from barrens, and the heavy rains of the current season have curtailed operations, soaked the moss, and prevented as large a harvest as usual. The moss, which is shipped to Canadian and United States points, has a variety of uses when processed. It serves as a very efficient insulation for houses when dried, is a highly valued fertilizer, and is used as a bedding for farm stock. The industry has been gradually developed in the Shippegan area during the past few years, and several companies have been engaged in the seasonal activities of harvesting, baling and shipping. One firm here, Western Peat Moss Company Ltd., which normally has over 100 carloads harvested and ready for market at this time of the year, is operating far below the average, and manager Lionel Robichaud stated many men would be thrown out of work if rains continue and the harvest is halted. Last year this company employed over 100 men, but this season only 25 are at work with only 90 carloads shipped. A spokesman for the Farfard Peat Moss Company Ltd., reported similar conditions with 40 men employed against 125 last season. Harvesting has been slow, it was reported, with 15 carloads shipped compared with 125 last year."
St. Croix Courier - Feb. 19, 1959 Peat Moss Rises As New Industry. - The peat moss industry in New Brunswick and Nova Scotia has been given a shot in the arm by a new packaging idea. Demand for the spongy growth of diversified uses, taken from vast bogs in both provinces, has been on the upswing since producers have been distributing it in small, easy-to- carry bundles. Four new bogs in New Brunswick and another in Nova Scotia have been opened since 1942. J.E. McIntyre of Moncton, Atlantic region agricultural agent for Canadian National Railway, say the odd industry isn't standing still. After completing an inspection trip to bogs and plants in N.B. and Quebec, Mr. McIntyre says peat moss from the Maritimes now reaches almost all important centres in eastern Canada and the United States. Peat moss is used chiefly for horticultural purposes, such as gardens, floriculture and packaging bulbs and roots in storage. It also has value as poultry litter, stable bedding and even insulation. Since the advent of polyethylene, small packages of the product are being marketed, with consequent ease of handling by purchasers. Prince Edward Island and Newfoundland also have huge quantities of the moss - it's estimated the Newfoundland bogs cover half a million acres - but in neither of these provinces is it farmed as a business."

Kings County Record - Nov. 10, 1960 Peat Moss Million-Dollar Industry. - PHOTOS - CAPTION. - Peat moss being dried at the Atlantic Peat Moss Co. Ltd., Shippegan Island operation before being taken to its mainland plant at Shippegan for processing, storage, bagging and shipping. CAPTION.- A section of the Fafard Peat Moss Co. Ltd., processing, storage, bagging and shipping sheds at its main plant at Shippegan, Gloucester County. Relatively unknown provincially, Gloucester County's peat moss industry adds around $2,000,000 annually to New Brunswick's economy. Two major peat moss companies, Atlantic Peat Moss Co. Ltd., Montreal, and Fafard Peat Moss Co. Ltd., Shippegan, N.B., operate just over 7,900 acres of Crown land on a license fee-royalty basis in the Shippegan district of the northeastern county. Starting from 'scratch' 18 years ago, the twin New Brunswick operations, together with Quebec and British Columbia companies, last year supplied 50% of the United States market for peat moss. Atlantic's president, J.C. Aubrey, states that 90% of the company's shipments are exported to the U.S., and F.X. Fafard that 45% of Fafard's got to the same market. Both claim the Canadian companies are gradually taking over the United States market from western German producers who used to supply 80 per cent of the States requirements. Main reason given being nearness of supply plus better service and customer contact. For the 12-month period ending July 1961, Atlantic estimates it will ship 1,000 carloads to western Quebec, Ontario and United States points as far west as the Rockies with gross sales of roughly $1,300,000. During the same period Fafard expects to ship 700 carloads to the same markets with gross sales around $750,000. Main plants of both companies are at Shippegan with Atlantic operating a second at Lameque, Shippegan Island, and Fafard another at Inkerminster. Fafard also is planning the erection of a third plant at Inkerman Ferry. Capital investment of both runs to upwards of $800,000 with an annual payroll of approximately $500,000 going to their approximately 500 full and part time employees. Both companies also have their own saw mills for the manufacture of veneer and laths for baling the peat moss for shipment. Three major companies, Atlantic, Fafard and Western Peat Co. Ltd, New Westminster, B.C., pioneered the New Brunswick industry in 1942, but Western dropped out of the picture several years ago. However, the B.C. firm is again taking a second look through exploratory work on a recently acquired option on 1,000 acres of Crown land in the district. Another interested party doing exploratory work in the area is Paul L. Tocci, Detroit, Mich., who has acquired an option on 411 acres. Illinois Peat Moss Corporation, Chicago which has an option on 2,500 acres in Alnwick parish, Northumberland County. Peat moss is mainly used and sold from Canadian sources for two uses: (1) To add vegetable matter to the ground. (2) To absorb and retain water and give it back to the soil when needed, which is why it is called a 'soil conditioner.' The bogs are drained and the peat cut by hand labour with specially sharpened shovels and transported either by conveyor or tractor to the processing plants after being dried in the open."

S.J. Standard - Jun. 8, 1910 Peat Bogs Great Provincial Asset. - Dr. G.F. Matthew Gave Instructive Lecture at Natural History Meeting. - Rockwood Bog 8,000 Years Old. - ... Dr. G.F. Matthew gave the address of the evening which was on the History of Rockwood Bog which fills a small valley of Rockwood Park. He referred to the bog as one of the most ancient monuments about our city. Portions of it were, in formation, coeval with the Nativity and others with the dynasty of the Pharoahs. The bog, about eight feet in depth, Dr. Matthew concluded, took about 8000 years to form. Remains in this eight feet of bog indicate successive layers of sphagnum and other mosses, grasses, etc., showing moist climate

conditions, of forest growth showing drier conditions, and thin layers of charcoal which indicated forest fires. A cedar tree which formed a basis for Dr. Matthew's calculations showed rings of growth indicating an age of 400 years. ... Wm. McIntosh spoke of the economic value of bogs and expressed the opinion that New Brunswick had in its peat bogs a natural asset of more importance than its coal deposits. It was estimated that the peat bogs of the United States were worth $58,000,000,000 and Canada had greater peat deposits than the United States. In Sweden and many American states, he said, peat was now being manufactured into briquettes and sold for fuel for manufacturing purposes. In Illinois the peat manufacturers extracted enough nitrogen from the peat to pay the cost of preparing it for fuel and the briquettes which sold for $12 per ton represented clean profit. He thought it was possible for some enterprising capitalists to make fortunes out of the peat bogs of New Brunswick."

Royal Gazette - Aug. 29, 1888 Notice. Notice is hereby given, that application will be made for Letters Patent by the undersigned, under The New Brunswick Joint Stock Companies' Letters Patent Act for incorporation as follows:- 1. The proposed corporate name of the Company is The Moss Litter Company. 2. The object for which incorporation is sought are the following:- The sale and purchase of real and personal property, and the right to acquire by purchase, lease or otherwise, the right of securing, raising, getting and working of Mosses and Lichen; the right to prepare, manufacture, ship, and deal in Mosses and Lichen for Litter and other purposes; the right to buy and sell merchandise, and to carry on a general business in Mosses and Lichens, with all powers incident thereto. 3. The office or chief place of business is to be in the City of Saint John, in the City and County of Saint John. 4. The amount of the Capital Stock is $100,000. 5. The number of shares is be 1,000, of $100 each. 6. The names, addresses and calling of the applicants, (of whom the first three named, that is, Robert Wiseley, William B. Wallace and G. Clowes Carman, are to be Provisional Directors), are as follows:- Robert Wiseley, of the City of Portland, in the City and County of Saint John, Chamberlain. William B. Wallace, of said City of Portland, Barrister- at-Law. G. Clowes Carman, of the Parish of Musquash, in said City and County, Farmer. Warwick W. Street, of the City of New York, in the State of New York, Broker. T. Clarence Wallace, of Englewood, in the County of Bergen, in the State of New Jersey, Clerk."

S.J. Daily Sun - Nov. 19, 1895 Peat Moss Beds. - Valuable Deposits in the Parish of Lincoln, Sunbury Co. - (For the Sun by Edward Jack, C.E.) - The deposits of moss (Sphagnum) in this provinceare of great extent and cover many thousands of acres. They occur specially on the millstone grit formation, as well as along the shores of the Bay of Fundy. That at Musquash is too well known to need description. When in Richibucto a few weeks since I met Captain Lange, who is a native of Chritiania, and who mentioned to me that the turf deposits in Norway were very much made used of as disinfectants and deodorizers, and that in the city named, which has, he says, 175,000 inhabitants, not one particle of feces, either liquid or solid, is lost, but that by the use of moss litter dust, it is all saved. In the closets there are automatic arrangements for supplying the moss litter when required. It is a complete deodorizer. The feces, he says, are allowed to fall into boxes, which are removed by public contractors at regular intervals. It is then prepared chemically and exported by rail, steamer or sailing vessel over and around the country, where it is used as a most excellent fertilizer. Last summer, in company with D. Morrow, M.P.P., I visited a peat moss bog, situated in the parish of Lincoln, in the county of Sunbury, and which is distant from a mile to a mile and a half from Rusagonis station, on the Fredericton branch of the Canadian Pacific railway, or less in a westerly direction from it. The bog is of a somewhat oval shape, with a long tongue of land running out to the middle of it at one end and a shorter one at the other. These tongues divide the bog into two nearly equal parts, not connecting however with each other. They will answer well as places on which to dry the wet moss, which can easily be done here without any artificial means, as there are no fogs in summer. It was on the 3rd of August last that we visited this place, and this was my first visit. Mr. Morrow had been there twice before, the first time about five weeks previously to the third of August and the second time on the 8th of July last, At his first visit he had sounded the bog and brought me a sample. On the 8th of July he sounded it in as many as 50 different places with a spade, removing the moss down to the peat. The depth of good moss was found to be from 2 1/2 to 4 1/2 feet. Below this it was more decomposed and soiled the hands, which the best moss- litter does not do. The bog is from 9 to 12 feet deep, but how much more I cannot say. When we were there on the 3rd of August we sounded all over it with a pole. On one place there was a growth of stunted spruce, but the moss under these trees was just as good as it was in any other part of the bog. This bog can be drained in one or two directions at little cost. It is on elevated land, and consequently contained in a high basin, which at one time had been a pond or lake. The peat forming the bottom rests on a white sandy clay. The surrounding country rock is of sandstone. A road can be had to the railway station with only a small rise, and that for but a little distance. The moss litter when prepared could be hauled either to the station, or to the Oromocto river, two miles distant from it, where woodboats and barges could be loaded. Being desirous of ascertaining the character of the moss in this bog, I sent a specimen taken by myself to the chief of the experimental station at Brehien, an institution originated and sustained by the Prussian government. From him I received a most favorable report. He says that the moss which I sent him resembled in its chemical composition the moss-turf of Nathueston, Germany, and that it could be characterized as being especially well adapted to the preparation of moss litter. According to his analysis 100 parts of fully dried matter would absorb 2,940 parts of water, or of the air dried (containing 30 per cent. of water) 2,028 parts. There was but little ash, as 98.40 parts in a hundred of the material were composed of combustible substances. Mr. Maclearn of this city having informed me that moss litter was now being made use of in the hospitals of New York, I sent a copy of the German analysis to a leading German physician of that city, who expressed the opinion that this moss could be used in hospitals, and that it would be well worth giving it a trial. Of course moss to be used for such purposes should be of the youngest growth and perfectly free from any substances which would soil the hands. This is indicated by its light brown color and by its freedom from dirt or dark coloring matter. The upper layer of the Rusagonis moss has all of these characteristics.

Mr. Morrow had been there twice before, the first time about five weeks previously to the third of August and the second time on the 8th of July last, At his first visit he had sounded the bog and brought me a sample. On the 8th of July he sounded it in as many as 50 different places with a spade, removing the moss down to the peat. The depth of good moss was found to be from 2 1/2 to 4 1/2 feet. Below this it was more decomposed and soiled the hands, which the best moss- litter does not do. The bog is from 9 to 12 feet deep, but how much more I cannot say. When we were there on the 3rd of August we sounded all over it with a pole. On one place there was a growth of stunted spruce, but the moss under these trees was just as good as it was in any other part of the bog. This bog can be drained in one or two directions at little cost. It is on elevated land, and consequently contained in a high basin, which at one time had been a pond or lake. The peat forming the bottom rests on a white sandy clay. The surrounding country rock is of sandstone. A road can be had to the railway station with only a small rise, and that for but a

little distance. The moss litter when prepared could be hauled either to the station, or to the Oromocto river, two miles distant from it, where woodboats and barges could be loaded. Being desirous of ascertaining the character of the moss in this bog, I sent a specimen taken by myself to the chief of the experimental station at Brehien, an institution originated and sustained by the Prussian government. From him I received a most favorable report. He says that the moss which I sent him resembled in its chemical composition the moss-turf of Nathueston, Germany, and that it could be characterized as being especially well adapted to the preparation of moss litter. According to his analysis 100 parts of fully dried matter would absorb 2,940 parts of water, or of the air dried (containing 30 per cent. of water) 2,028 parts. There was but little ash, as 98.40 parts in a hundred of the material were composed of combustible substances. Mr. Maclearn of this city having informed me that moss litter was now being made use of in the hospitals of New York, I sent a copy of the German analysis to a leading German physician of that city, who expressed the opinion that this moss could be used in hospitals, and that it would be well worth giving it a trial. Of course moss to be used for such purposes should be of the youngest growth and perfectly free from any substances which would soil the hands. This is indicated by its light brown color and by its freedom from dirt or dark coloring matter. The upper layer of the Rusagonis moss has all of these characteristics.

Codes: V3 / IDX_Names: Pisarinco Asbestos;
S.J. Globe - Nov. 11, 1879 An Asbestos Mine. - Messrs. John Calhoun and Isaac Duffy, of Carleton, have commenced operations at Pisarinco on what is believed to be a large vein of asbestos mineral. It seems that about a year ago a young man named Robert Spillane, who then lived at Pisarinco, and a blacksmith of Portland named Wm. Bolton, discovered in some rock on the sea shore, at this side of the village, a very small quantity of white asbestos fibre. Feeling confident of success the two bought the property on which the fibre is, from the estate of the late Charles Merritt of this city. Fortune did not favor them, however, and, being unable to proceed further with their work, they accepted Messrs. Calhoun and

Duffy's offer for the right of the land. Accordingly on Friday last operations were commenced. The fibre protruded from the bank at about the high water mark. A space of about ten feet square was cleared on the top of the hill; when about three feet of earth had been thrown off the rock was laid bare in which the asbestos is here and there visible. The fibre, which is white, is about half an inch in length, and lies embedded in a greenish colored stone, which runs in veins of from one to three inches in breadth in a hard white stone which very much resembles marble. Thus far the material appears very irregularly and, in fact, seems to have been deposited in pockets as it were, in the solid rock. Altogether about a hundred weight of the asbestos has been got out of the rock. Samples have been sent to New York and Edinburgh. From both these cities very favorable reports have been received. The asbestos which is used in fireproof roofing. Of the white asbestos cloth is made which is put in fireman's clothing, &c. It will be worth about $400 per ton, and being very compact is as heavy almost as the stone from which it is taken. It is impossible yet to tell in what quantities the valuable substance will be found, but from the inducements offered thus far Messrs. Duffy and Calhoun feel that they can continue the work advantageously. They will find ready markets for the expensive mineral in New York, Paris and London. At present there are three men working on the field beside themselves. Proceedings are tedious as the rock has to be blasted all the way through."

Codes: V3 / IDX_Names: Pisarinco Asbestos;
Daily News - Nov. 12, 1879 An Asbestos Vein. - Messrs. John Calhoun and Isaac Duffy, of Carleton have begun operations in Pisarinco on what is believed to be a large vein of asbestos. It was discovered about a year ago by a young man names Robert Spillane, and a blacksmith named William Bolton, of Portland, who bought the property, but being unable to work it properly sold their right to Messrs. Calhoun and Duffy. Altogether about a hundred weight of material has been got put of the rock. Samples have been sent to New York and Edinburgh and very favorable reports have been received with regard to it. It is said to be of the very best quality. Three other men are working there besides Messrs.

Chignecto Post - Nov. 13, 1879 An Asbestos Mine.- Messrs. John Calhoun and Isaac Duffy, of Carleton, have commenced operations at Pisarinco on a large vein of asbestos mineral, best quality, worth about $400 per ton."

Moncton Daily Times - Nov. 22, 1879 An Asbestos Mine. - Messrs. John Calhoun and Isaac Duffy, (of Albert Co.) have commenced operations at Pisarinco, N.B., on a large vein of asbestos mineral, best quality, worth about $400 per ton."

Codes: X4 / IDX_Names: Digdeguash Mineral Paint;
St. Andrews Standard - Aug. 11, 1858 Paint Deposits.- We understand that in the vicinity of the Digdeguash Mills, St. Patrick, a body of decomposed ochrous iron ore was a short time ago discovered. The paint has many of the features of a real pigment, and is entirely free from clay. The paint was found on land owned by Wm. Fletcher, Esq., and is a part of the property formerly owned by the late Mr. Allanshaw."

Codes: X6 / O7 / SPRI / IDX_Names: Tobique Gypsum; Salt/Potash - Sussex Area; Mineral Springs;
S.J. Daily Sun - Nov. 11, 1884 Up the River. - From St. John to the Tobique, thence to Bathurst. - .... The First Settler on the river (Tobique) was Edward Campbell ..... Mrs. Giberson, the daughter of Mr. Campbell, ...I was shown a very fine piece of quartz, containinggold, which was found in one of the streams flowing into the Tobique....... We soon came in view of the PlasterRocks - a curious formation - looking like red sandstone with white streaks running through it horizontally, and so soft that it can be cut with a knife, without injuring the edge. It resembles very closely the meat of the cocoanut in color and texture. People come from Fort Fairfield in Maine during the winter and pay one dollar for a two horse load, one dollar and a half for a three horse load, &c., and sometimes as many as thirty or forty teams are hauling in one day. It is used for manuring the land and is excellent for a grass crop where the land is worn out. Edgar Bros. at Three Brooks, six miles below, own the plaster rocks and grind them at their mills. They sell the ground plaster for thirty cents a bushel to the farmers. I obtained some beautiful specimens of the rock nut lost them during my trip across the country. The formation isa wonderful freak of nature, and looked at from the water, the rocks assume curious and fantastic shapes. One piece of rock, standing out from the rest, resembles very closely a lion's head, from which likeness it takes its name. It is about seventy five feet high. A few rods up the river, are two springs, issuing from a rock and used by the Indians for medicinal purposes. One of the springshas a saline taste and was called by the Indians Salt Spring. In the olden times, the Indians made pilgrimages to the springs to be cured of all the ills that flesh is heir to. ...."

Codes: Y1 / IDX_Names: Salt Springs Salt;
Daily Telegraph - Dec. 14, 1875 The Salt Springs near Passakeag, K.C. - To the Editor of the Telegraph: Sir. - Few people are aware of the extent of the Salt Springs, situated about seven miles east of Passakeag Station, on a point of land formerly owned by Mr. Alexander Campbell. Early in the spring of the present year, James Sharp, Esq., of Apohaqui, purchased the site and 50 acres of land, and in less than three months from the date of purchase, had erected a dwelling house, and a building 40 x 30 feet, two flues, and two sets of boilers running nearly the whole length of the building, and manufacturing a fine, butter salt, at the rate of about five bushels a day, after making extensive alterations and refitting. The supply shaft is sunk 26 feet down in the spring, from which the liquid is conveyed by means of an attached trough, without any mechanical aid whatever. Below this depth there seems to be a real lake bottom, or open area, and within five or six rods of the spring at present used, there is another apparently equal to it in every respect. The proprietor intends

adding four new sets of boilers at an early day, and when the works are completed and in running order, will have a producing capacity of 100 bushels salt per week, which is retailed at the mills, at $1 per bushel, and finds a ready market, in fact the orders are not nearly half filled. There is a dry house and the usual apparatus in the manufacturing process, in close connexion with the main building. At present about 1 3/4 cords wood are consumed per day, and when in full working blast will require 3 cords daily. The wood is delivered at the works for $1.50 per cord. Men and teams are now busy delivering, some 500 cords being contracted for. Mr. Sharp cannot be too highly commended for the push and enterprise evinced in the construction of these works, affording as they do, employment for many. This is an instance of the pluck and energy of our own men, and we sincerely trust they will realize a handsome return from the capital invested. D."

S.J. Daily Telegraph - Dec. 16, 1875 Passakeag Salt Works. - We are informed that Mr. Joseph S. Sharp and not Mr. James Sharp is the proprietor of these works."

Moncton Daily Times - Sep. 18, 1880 The Salt Works at Salt Springs, Kings County have been purchased by a company of Americans and others, who purpose starting the work at once. New boilers, etc., are to be put in. This is a valuable property, situated about 15 miles from Sussex and 6 miles from Passakeag Station."

Daily Telegraph - Sep. 25, 1880 The Salt Works at Salt Springs, Kings county, have been purchased by a Company of Americans and others, who purpose starting the work at once. New boilers, etc., are to be out in. This is a valuable property, situated about 85 miles from Sussex and 6 miles from Passakeag Station. - Moncton Times. The gentlemen referred to above are, Dr. Parker, of Boston, and messrs. G.R. and W. Pugsley of this city. They have purchased the Salt Springs property, and intend, we believe, to make extensive improvements without delay. As our contemporary remarks, the property is considered to be a valuable one, the water from the spring, which is so situate that it may be made to flow into the pans without the labour of pumping, being sufficient to turn out a liberal allowance of salt daily. A correspondent informs us that the first salting off took place yesterday, and that the salt produced is of a very superior quality. It is intended to have some ready for the Exhibition. As the trade returns show that there were upwards of 90,000,000 lbs. of salt imported into the Maritime Provinces last year, there would seem to be a good field for this

Daily News - Aug. 13, 1881 New Brunswick Salt. - The New Brunswick Saltsprings Company have ordered a steam engine and boiler from Messrs. Abrams & Kerr for use at their springs at Upham, K.C., and expect to have it in operation next week. We understand that they have erected a large tower, filled with twigs, to assist in natural evaporation. This system, which has been for a long time in use in Germany and other places, greatly cheapens the cost of salt manufacture. As the company expect, when their works are completed, to turn out about two hundred bushels daily, the industry will be an important one for that section of country. The salt has a high reputation for its purity and excellence for dairy purposes. We shall give our readers a fuller description of this interesting manufacture in a future issue."

S.J. Daily Sun - Sep. 29, 1882 Salt Making at Upham. - Perhaps many of the readers of the Sun are not aware that there is a Salt Manufactory in the parish of Upham in King's County. It has been known for a long time that a natural saltspring existed in the locality, and a few years ago a man named Sharp had it developed but could not make salt in paying quantities; in fact, went to such an expense in experimenting that he had to assign and lost what other property he had. About two years ago Dr. Parker, an American gentleman of means and leisure, bought out the property and spent a large amount of machinery and appliances to make salt and has apparently succeeded admirably, as he is now making salt the most pure and beautiful imaginable, and for dairy and table use nothing in the world can excel it. The method of manufacturing is somewhat as follows:- The water from the spring is run into a reservoir and pumped with a steam engine up to the top of a building which stands about 300 feet away, and is of itself a curiosity. It contains a frame, forty by fifty feet and forty feet high, very strongly built and left open, with the roof at the bottom. The frame is filled with small beech and birch twigs, and as the salt water trickles down through them, the wind blows the fresh water out, and the brine is about ten per cent. stronger each time. The brine falls on the roof below and is conducted by spouts at the eave of the reservoir, and is pumped back twice on the brush which makes it very strong. It is then run to the boilers which are made of boiler plate iron (there are five of these and a cast iron boiler) which are kept constantly boiling until the salt is produced, the brine being constantly changed from one boiler to another nearer the heat as the work progresses. Hampton, Sept. 25, 1882"

S.J. Daily Sun - Oct. 23, 1883 Salt Springs. - ... The Salt Factory, located here, carried off first prize in the St. John Centennial Exhibition for both coarse and fine salt. This company has expended large sums of money here, and we are glad they are meeting with encouragement. The writer does not know what their plans for the future may be, but he hopes they may be successful, as it would be a loss to the community if such an industry did not prove remunerative."

S.J. Daily Sun - Jul. 17, 1884 Salina. - The property of the Salt Co. is muchimproved in appearance this summer. New fences, painting and planting of flower and garden seeds have added to the neat appearance of the place."

Daily Telegraph - Dec. 29, 1888 Salt Mine in King's County. - It is rumored that several farmers in Salt Springs Valley, King's County, in conjunction with some others who take an interest in the development of the salt industry in King's county, are taking the necessary steps for the formation of a company with the object of boring for salt rock. As the deposit lies on the line of the proposed extension of the Central Railway, between Norton and Barnesville, the discovery of rock and the establishment of salt works would add considerably to the revenues of the railway, which, of course, in its turn, would largely contribute to the success of the working of the mine, affording facilities for getting the product to the

Codes: Y1 / IDX_Names: Salt Springs Salt;

Moncton Daily Transcript - Dec. 29, 1888 Salt Mine in Kings County.- It is rumored that several farmers in Salt Springs Valley, Kings County, in conjunction with some others who take an interest in the development of the salt industry in Kings County, are taking the necessary steps for the formation of a company with the object of boring for salt rock. As the deposit lies on the line of the proposed extension of the Central railway, between Norton and Barnesville, the discovery of the rock and the establishment of salt works would add considerably to the revenues of the railway, which, of course, in its turn, would largely contribute to the success of the working of the mine, by affording facilities for getting the product to

Chignecto Post - Jun. 21, 1888 Boring for Salt.- It is reported that a company has been forrned to bore for salt at Saltsprings Station. An Ontario expert is convinced of the presence of salt in large quantities."

Weekly Record - Fri., Jul. 26, 1895 and Chignecto Post - Aug. 1, 1895 Boring operations at Upham. - As has been known for some time boring operations in search of salt has been going on at Salt Springs in the parish of Upham. In an endeavor to gain some information on this subject a RECORD representative visited the place, but could not gather all the facts, as the parties carrying on the same are very reticent and do not give any more information away than they can help. Mr. Bald, the gentleman who putdown the artesian well for Mr. S.H. White last summer, has charge of the boring at Upham and up to date has reached a depth of 327 feet. He started work about the first of June and was succeeding immensely till he struck a layer of gravel, when his trouble commenced. While in St. John getting piping to keep the gravel from falling in on the drill, some miscreant dropped a large piece of iron down the hole, which has kept the operator back several days and may possibly lead to the abandoning the work altogether. Mr. Bald has tried every possible scheme to get it out, but without success and is about giving up in despair. This will mean a serious loss to him as he is under a contract to go 500 feet, and will probably receive nothing for his summer's work if he fails to carry out the same. Local jealousy is hinted at as the foundation of the trouble, which, if true, is certainly very much to be regretted, as the salt industry, if once developed, may mean a great thing for this county. One remarkable feature of the boring has been that at depths of varying from 200 to 300 feet and over, pieces of wood, buds of trees and all such material as is found on the sea beach have been brought to surface, all excellently well preserved. While giving all the information asked for in regards to the working of the machine and other facts of Interest, Mr. Bald appeared to not know or fight shy of telling who was backing the enterprise. He said he had been sent there by Hon. Wm. Pugsley and thought the Solicitor General and the Local Government were behind it. So far as he had gone the prospects had been good according to the geologist who examined the material brought up, and it is hoped that the unfortunate occurrence will not prevent the backers of the enterprise from carrying on as extensive a search as they at first intended. In connection with the search for salt in Kings county it is rumored that some interesting developments will take place in the vicinity of Sussex within a few weeks."

Weekly Record - Fri., May 24, 1895 BORING FOR THE SALT ROCK.- Salt springs are to be found in different parts of this county, but those at Cardwell and Upham are the principal ones. Salt of the very finest quality has been produced at the Cardwell springs for nearly a century, but the quantity has been limited in consequence of the excessive expense incurred in the evaporation of the brine. The provincial government is now desirous of instituting a series of experimental borings in order to reach the salt rock so that the brine of the very strongest kind can be obtained from which salt can be produced at very much less expenseto the manufacturer than is now possible with the evaporating of brine that has such a large percentage of water in it. If the proposed experiments should turn out satisfactorily, the result will be of immense value and importance, not only to this county but to the province as well. At present the greater quantity of salt used in the provinces for dairy and table use, is brought from Ontario, a distance of over a thousand miles. There is, therefore, a most urgent demand that our people be in a position to produce this indispensable article of every day use as cheaply as those living in other parts of Canada. The government will, under the supervision of Surveyor General Tweedie, cause borings to be made at the salt springs at Upham, as a first test, and should this prove satisfactory, other localities will doubtless have attention. Success to the undertaking we say."

S.J. Daily Sun - May 28, 1895 Boring For Salt. - Hon. L.J. Tweedie, the surveyor general, is in town. He will be engaged today in connection with an equity suit, and tomorrow he accompanies Hon Wm. Pugsley to Kings county for the purpose of examining the salt springs at Upham, with a view to considering the question of taking action for their development by boring for salt rock. The government are authorized by statute to give assistance in this direction, and considering the valuable and extensive deposits that undoubtedly exist in Kings, it is confidently expected that by a judicious expenditure of a reasonable amount of money in boring a valuable and important industry will be developed."

Weekly Record - Fri., Mar. 8, 1901 Boring operations for salt are being carried on at Salt Springs."

Codes: Y1 / IDX_Names: Salt Springs Salt;

Daily Sun - Mar. 28, 1901 Seeking Salt. - Local Government Operations in Kings County. - Dr. John Smith of St. John, north end, was at Hampton on Monday, en route to Salt Springs, to see how the work of boring for salt which is being carried on by and for the local government at that place, is progressing. He found, however, that Foreman Edward Kemp and some of his workmen had come out for lack of pipe required to carry the drill through the deep strata of sand which prevails at the spot where the works are set up. The site chosen by Engineer Gooderich for the experimental work which the government has undertaken is about the centre of a meadow on the farm of one Doherty, and occupied by Edward Hogan, who, some of the older readers of the Sun will remember, was the man who made a fine exhibit of table salt at the first St. John exhibition. That salt was obtained by boiling down the saline waters that gathered in a well he dug on this meadow only a few feet deep, and close to the bank of a small stream which flows through his farm from the hills which form the northern line of his property. It was of a remarkable bright and fine quality, and its exhibition raised very sanguine hopes that the work of developing it would be taken up and prosecuted to a successful issue. Some little distance west of the Hogan place a Dr. Parker of Boston carried on some prospecting work on the meadow west of the Campbell farm, but failing to obtain a brine of more than six per cent of saline matter, he did not feel like risking the large investments of money freely offered by his friends in the States, and which would be necessary to prosecute the work of development. And so the whole matter fell away from anything like a determined effort to discover the salt rock or the stream of brine which geologists have indicated as the mineral wealth of this pretty little valley. Within the past month, however, the local government has taken the matter up and entered into a contract with a Pennsylvania borer named Finley, who has set up an engine, boiler and other necessary plant for a thorough test of what the valley contains. The site chosen may not be the most economical or propitious, for the soil is sand and the drills soon clogged. Eight inch iron pipes were procured and driven down as the drill prepared the way, and now a depth of about 125 feet has been reached, at which point the supply of iron pipe was exhausted and work suspended until a fresh supply can be obtained. naturally in such a locality the supply of water is abundant, and it now freely flows out of the eight inch pipe at the height of 8 or 10 feet above the ground. But thus far there is only the faintest indication of brackishness, although there is a strong taste of some other mineral present. This plant is well housed, and operations will be pushed on as the supply of pipe is furnished. The men work night and day in two shifts. In a northeasterly line over the valley which separates the Salt Springs valley from the Campbell Settlement, and the latter from the southeastern portion of the parish of Sussex, the streams also bear evidence of having come in contact with salt formations, and the question consequently arises whether the prospect of finding rock salt or brine streams does not rather lie at a point where the brooks which run north and south first give indications of possessing the saline element, rather than in the low lands on either side, to which the sedimentary contents of the waters are naturally borne. Meanwhile the boring in the low lands continues."

St. John Star - Mar. 28, 1901 The boring operations are in progress at Salt Springs, Kings Co. To determine the value of the solid deposits there, a depth of about 125 ft. has been reached without as yet satisfactory results."

Codes: Y1 / GYP / LIME / E5 / IDX_Names: Salt Springs Salt; Gypsum; Lime - General; Sussex/
Plumwesweep Salt;

S.J. Daily Sun - Mar. 26, 1888 House of Assembly. - ... Mitchell committed abill further relating to Mines and Mining Leases. He said the bill proposed that carbonate of lime, sulphate of lime, or gypsum shall not be subject to any royalty to the crown. The second section proposed that the governor in council, upon being satisfied on the report of a mining engineer, geologist or other competent person, that there is a reasonable probability of discovering valuable mineral deposits in any part of the province by boring, sinking shaft or other methods of exploration, may on the recommendation of the surveyor general by order-in- council, authorize an expenditure out of the public moneys of a sum not exceeding $2,500 in any one year, in and of or for the purpose of prosecuting such boring, etc., and the surveyor general's annual report, shall contain full statement of exploration if any, the expenditure therefor, and all other such information. Another section of the bill gave the governor in council power to cancel mining leases when certain conditions were not complied with. Speaker Pugsley said he was glad to see the government making a move in this important matter. During the election in Kings his colleagues and himself had promised if elected to do what they could to aid in the development of the mining interests of the country. This bill was intended to advance the mining interests not only of Kings but of the whole province. That being so he had no doubt it would meet with general approval. It had been shown that Kings county was rich in manganese and salt deposits, and there were indications of coal there in paying quantities. With proper encouragement, mining in Kings county must be attended with good results. This bill does not propose to take away the rights of those interested in mining. Its effect will be to enable the surveyor general in proper cases to go to a certain expenditure with a view to assisting the mining industry. As he had said, the bill was a move in the right direction. Tweedie said the bill did not propose anything new. The province has had an experience in this direction before. They all remembered what the diamond borer had cost and that the deepest hole it ever bored was a hole in the provincial treasury. Under this bill $2,500 would be given to some county, Kings perhaps, for nothing. The section empowering the cancelling of leases was an improper one and he instanced cases where under it an injustice might be done.Attorney General Blair said it was possible the amount named would not be advantageously expended. The Government had thought it a duty to make the experiment of aiding in mining development, and, though the sumproposed was small, the result might be very satisfactory. If the salt deposits of Kings are as great and valuable as it is said they are their development would be an immense advantage to the whole of New Brunswick, and the amount of revenue to the province would be very handsome. The bill, however, did not intend to apply only to Kings, but to any other part of the province where there was reasonable evidence to warrant an expenditure by the surveyor general. Speaker Pugsley again referred to the salt deposits of Kings County. Valuable springs coming direct from the rock have been discovered in different parts of the county. The brine from the Sussex and Upham springs contains salt of the purest character and farmers are willing to give twice as much for the salt from these springs as for Liverpool or Ontario salt. There is every evidence that these salt deposits exist over the whole area of the country from Sussex to Hammond River. If the salt rock can be discovered, its development would no doubt be attended with most satisfactory results, in which case the royalty of the province would be large. The salt deposits of Syracuse, N.Y., had given to that city a population of 50,000 and a royalty to the State of New York up to the present time of $5,000,000. There was no reason to suppose that with proper encouragement the salt mines of Kings County might not be equally valuable to that county and the whole province. Hanington said he wished the proposal to aid in the mining development of the province every success. He referred to the efforts of private individuals to develop the mines of Albert, and expressed the opinion that if properly worked the mines of New Brunswick would produce gratifying results. Heatherington said his bill reflected the highest credit upon the surveyor general. He would heartily support it, because it was intended to help the development of the mines in Queens and other counties in the province. ..."

Codes: Y1 / SPRI / IDX_Names: Salt Springs Salt; Mineral Springs;

Kings County Record - May 13, 1932 Salt Springs. - Salt Springs is situated about thirty miles east of the Loyalist city of Saint John and about fifteen miles southwest of Sussex. The name Salt Springs was given because of numerous salt springs in this locality. Years ago salt was made here and salt wells are to be found in many places, the water being a favorite drink of the deer, which come to open places in winter.There is also a mineral spring quite near the main road that has flowed through a pipe sunk to a distance of about 350 feet, which flows winter and summer alike, the water being considered very beneficial in cases of rheumatism, and was bottled and sold under the name Mahpu, being named after the parish in which it is located, Upham, the letters being reversed."

Codes: Z2 / LIME / O7 / GYP / J8 / IDX_Names: Sandstone, Building Stone, Monument Stone, etc.; Lime - General; Salt/Potash - Sussex Area; Gypsum; Albert Mines;

S.J. Daily Sun - Mar. 1, 1889 Hopewell. - … (The Rocks) - The cape is best known to sailors as a conspicuous point on the coast during several hour's sail, and ashore for its interesting scenery. Though not as grand as the Giant's Causeway, Fingal's Cave, or the Palisades, yet it is easy of access, well worth seeing, and adds materially to the pleasures of a summer holiday. It is on the west side of the bay mentioned, has a water front near to low water mark of about one quarter of a mile, with a height of 100 or 150 feet. The south end is bold, the north end forming a gentle slope to low ground. This point is reached by a carriage road, and here an array of water worn columns of rock 20 to 30 feet high above a smooth, sloping beach, met the eye while the shore wall is seen to be honeycombed with caverns. Farther down shore past projecting reefs and recurring recesses, as the headland rises, the outstanding masses grow more lofty andimposing, occasionally approaching the height of themainland, with a diameter of 30 to 50 feet. Some areapparently solid and several rods away from the bluff,others parted off by a fissure a few feet wide and rifted from top to bottom, with their bases riddled by long oval shaped passages which here and there almost undermine a towering and ponderous slab. The tunnels, galleries and caves differ in size, shape and form. Here is one roomy as Dan O'Connell's acts of parliament; the next with scarcely standing room, while another has 20 feet of space between its floor of sand and pointed arch overhead. They run parallel to each other at times, or cross at right angles. Some go straight through from daylight to daylight, others by turns and surprises, or now and then end in the cliffs too far and too dark to be explored without a light. The rock at these peculiar places is chiefly a fine grained, tough, dull red, conglomerate, alternating with other layers of red sandstone, and coarser conglomerate, all containing a proportion of lime, which appears to be the cementing ingredient between the layers as well. It pounds up more readily than it splits or breaks and is an unwilling stone to give up specimens. Probably it was formed without flaws, but irregular lines of cleavage now run up and down through it at varying distances apart. These cracks have evidently marked out the isolated portions and located the caverns. Atmospheric agencies, the surf, and the beach pebbles, burrowing in the crevices have done the rest. No caves a mile long and necessarily earlier formed, of which written descriptions and traditions tell, could be found. Fractures similar to these would reasonably account for the remarked absence of living springs over a considerable area of neighboring country. Down shore at the southeast corner two regular wall like ledges of blue limestone reach under the tide and in shore rise in a precipice. Here a pile of large square blocks have ground upon each other showing the marks of the waves' tremendous force. This is the most enduring stone of the group and contains curiously worn arabesque pieces, with veins resembling bunches of grapes. The Cape rocks seem to be older than the fossil marked sandstones at St. Mary's Point and Hopewell Cape, on either hand, on the same shore, but widely separated. … Close by Cape Demoiselle Creek empties into the bay. This stream gives its name to the country through which it flows. One branch takes its rise near the once famous Albert mine. Large deposits of gypsum, freestone and limestone, with indications of salt are found along its course; freestone and lime stone have been extensively quarried. These facts, with the name as a connecting link, seem to call reference to them. .... Though prospecting to any extent for albertite has ceased, and in view of an estimated expenditure of $100,000 by several American companies in trial pits and borings outside Albert mines limits, yet there is a lingering and quite general hope that the lustrous mineral will crop out at some unexpected place and time."

Telegraph Journal - Aug. 31, 1929 The Maritime Exhibit at The Toronto Fair. - ... Mineral Exhibit. - The minerals of the province, ranging in size - and importance - from soft coal and granite to a small specimen of very brilliant, but uncommercial Albertite, are well represented andinclude copper ore, antimony, gypsum, iron ore, oil shale and high calcium limestone. There are grindstones, pulpstones and building stone from the Miramichi QuarryCompany; the granite is from St. George and the Spoon Island Granite Company; St. George is also responsible for some very fine marble and the New Brunswick Gas and Oilfields are showing oils and byproducts as well as rock salt. ..."

Codes: Z3 / IDX_Names: Guano;

Headquarters - Apr. 17, 1844 and Loyalist - Apr. 25, 1844 Guano - A few tons Guano was brought from the Seal Islands last week, in the pilot boat Porpoise, Capt. Maloney, and we believe a few hundred weight still remains to be disposed of. We hope some of the purchasers will give the article a fair trial, by comparison with other manures, and in the fall know the result - as, should it prove a valuable manure, we believe large quantities may be obtained at a very trifling cost - St.

Morning News - Jul. 8, 1844 Guano. - A gentleman in Eastport called at a Seed Store a few weeks since, and after purchasing several varieties of cowcumber seeds - thrust them carelessly inhis coat pocket - before leaving the shop he procured a few ounces of guano, carefully wrapped in a stout paper, which he also placed in the same pocket. The following morning when putting on his clothes, he was not a little astonished at the verdant appearance of his coat flaps. The skirts were literally covered with vines; some of them several feet in length - the earlier varieties in full blossom and the later species in the third leaf. ""This,"" said our informant, ""is the way we force things in the U.S."" Perhaps stretch would have been more appropriately used. Those who saw some of the vines speak of them as remarkably strong and

Morning News - Jun. 12, 1844 Guano - The Manure Mania. - The world seems to be full of guano all at once; it is in every body's mouth -that is, every body is talking about it, and every body seems anxious to get hold of some of it, to look at, and apply to their lands, to see what strange things will come forth. The world is full of it; but we mean the talking world; in a more literal sense, guano is a very scarce article, and only to be found in a certainisolated locality. The island from whence the guano is taken, (as we learn from the New Philosophical Edinburgh Journal,) is about three miles from shore, on the south-west coast of Africa. It is a barren rock about three miles in circumference; has no soil or the least sign of vegetation. The guano lies to the depth of about twenty feet, and without any variation in quality. The continent is very sandy, and, in high winds, (hurricanes for instance), will cover a ship's deck nearly one hundred miles from the land. - The birds on the island are a kind of penguin and cannot fly to any distance, if at all, their wings being a kind of fin. It is believed that the Captain of the vessel who brought the guano was the first human being who set foot on the island, which is very difficult to approach, there being no harbour, and a heavy surf. On walking on it, he could scarcely set his without treading on the birds, and they took no notice what ever of him, except pecking at his feet, he being barefoot - and, on a gun being fired, they merely fluttered a good deal, and made much noise. There is no fresh water, it is believed, for some hundreds of miles along the coast and no rain. Upwards of one hundred vessels have already been despatched from Great Britain, to gather the precious substance; it is becoming quite an article of commerce; and, indeed, one of the most profitable known to the present day. Vessels are fitting out from all parts of the world, for the African island; nor are St. John and Halifax behind the fashion, for the merchants of these places are sending forth their ships for supplies. No doubt all kinds of tricks will be practised in different places to pass off a spurious for the genuine article as soon as it comes more into use; and farmers, and others must therefore be on the scent or they may be caught by chaff. In Halifax, we perceive that the boys have commenced operations in this way already; they have actually been gathering the contents of swallows' nests, and representing them as guano from the wreck of the Saladin; and they have not been in want of purchasers. The Editor of the Post informs his readers, that he has a piece of guano lying at his office for the inspection of the curious. Dr. Gesner also has a piece ""about the size of a piece of chalk, which he exhibits at his geological lectures. We trust that the Doctor's is the real genuine and that there is no ""bone"" about it; or that the swallows had anything to do with it, for we shouldn't like the Haligonians to swallow anything but the real guano itself. Several supplies have been received in this Province, and have been applied to the land; but with what success, we have not yet learned. The guano is said to be a very powerful manure; and it requires a person who has some knowledge of its properties, or effects, to make use of it to advantage; for instance, if too much be applied, it is injurious to vegetation; it burns up the soil, and of course the manure is wasted. We are informed that it must be portioned out in very precise quantities; neither too much nor too little in one place; and if it be properly used, it will expedite vegetation fully two weeks - making the difference of

Loyalist - May 30, 1844 Guano. - An enterprising ship owner of St. Stephen fitted out a vessel at his own expense, which proceeded to the coast of Africa, took a cargo of this valuablemanure on board and carried it to England, on which it is said he realized œ4,000 profits. Notwithstanding all that has been said about the extraordinary qualities of Guano, the farmers on the River St. John have not yet had not an opportunity of becoming acquainted with its effects. We understand they will not be able to make this plea much longer, for we are informed that Mr. Scovil of St. John is about to fit out two vessels for the coast of Africa to obtain cargoes of Guano. This information, however, is not direct, and if we have been misinformed we shall be glad to be corrected."

Chignecto Post - Jul. 29, 1880 Albert. - The manufacture of alum, bleaching powder and sulphuric acid, was formerly carried on at the mountain, but the Crimean War caused such a rise in some of the chemicals requisite for the work that the industry was abandoned. Only the ruins of the works remain."

Evening Gazette - Jul. 28, 1892 and S.J. Daily Sun - Jul. 28, 1892It is said that deposits of guano have been found of quite an extensive area on Three Islands, and that parties from Musquash have taken an amount of it to test it as a fertilizer, and that they have leased part of one of the islands and want to lease the rest."

S.J. Daily Sun - Apr. 11, 1881 The Mineral Wealth of Albert. - Hillsboro, April 4th, 1881. Mr. Editor:- I have noticed from time to time that reference has been made to the mines and minerals of Albert County. So the Frenchman said of London, it is a province covered and filled with mines and minerals; and - much has been said and written, perhaps the half hasnot yet been told. Beginning at the boundary line between Albert and St. John Counties, we find copper all along the bay shore as far east as Salmon River, where a company is about being formed by Messrs. Cleveland and Steadman, with a capital of $100,000. We wish the enterprise every success. Coming up to Harvey we find a valuable depositof the same mineral at New Horton. At Harvey Point wefind the famous freestone quarries of Messrs. Roberts & Stevens. From these quarries a large number of the stone buildings of Boston and New York have been built. Coming up to Hopewell are the famous stone quarries of Messrs. Hayden, employing a number of men. At or near the Hill Corner has been discovered of late, manganese said to beworth $130 per ton. The company is about commencing operations on a large scale. In Salem manganese has beendiscovered on the farm of Jeremiah Steeves, only awaiting further developments. The lime stone worked by Messrs. McHenry, as well as the plaster quarries of J.T.Tompkins, are considered inexhaustible. That yellow metalso much coveted called gold has been discovered at New Ireland. We learn that searching and exploring willcommence immediately. We are indeed sorry to say that thefamous Albert coal mine is about to close, the deposit of Albertite, worth $25 per ton, having about run out. During the twenty-two years it has been worked, about $4,000,000 worth of that wonderful coal has been raised. Yet it is the opinion of experienced miners that the Albert mine is only a branch of the grand trunk and that the grand trunk is in Baltimore, about four miles west of the Albert mine. Miners tell us that the course of the coal in the Albert Mines is east and west, and as the mountains of shale in Baltimore more correspond exactly with the shale at the Albert mines, and the course is directly west, it looks both reasonable and probable that the Albert coal, so called, exists in mammoth deposits in Baltimore; and, as further proof of coal in that place, small pieces of coal precisely like the Albertite coal can be picked up at any time in the small brooks and rivulets running through those shale regions, which, of course, have been washed out in times of heavy rains. And as those undeveloped coal fields, as we believe them to be, are only four miles from the Albert Railway, and a level grade to and from, the means of transportation would be both cheap and easy; and we believe that if a little capital now lying idle in England and other countries was expended in Baltimore, the remuneration might be counted by millions. Yours, A.B."

Daily Sun - May 23, 1901 John H. Harding obit. - ... From lumberingand milling Mr. Harding turned his attention to gold and coal mining, and not very many years ago to the development of manganese in St. Martins. He was foremost in taking hold of Nova Scotia gold, when most men scouted the presence of the precious metal in that province inpaying quantity as the dream of a lunatic, and was one of the first to catch on to the value of Albert county's oil regions. Mr. Harding erected the first quartz crusher in Nova Scotia, and not only extracted gold from the product of his own mine at Rexford, but handled the output of several other mines. From Nova Scotia gold to the oil regions of Albert Co. was but a step in Mr. Harding's onward march. He was at the forefront of the development of the natural wealth of the two provinces, putting up his money and his brain as capital and risking all on the cast of a die. Nowadays promoters risk nothing. They give politicians in power the tip, a charter with a subsidy from the public treasury follows, and the credulous public subscribe the rest of the cash. Mr. Harding operated quite largely in Albert Co. He bought areas, built a refinery to extract the oil from the shale, made several large shipments to the United States of an illuminating oil superior to all others, that commanded some 80 cents a gallon, and the enterprise was on the high road to making all concerned millionaires, when the discovery of oil wells across the border came like a bolt out of a clear blue sky. The Albert shale oil company could not compete with the new product, oil fell rapidly in price, and the concern had to wind up its business. Nothing daunted by the reverse, Mr. Harding turned his attention to coal mining in Nova Scotia, and was one of the pioneers in developing the Springhill mines, now among the best coal properties in Canada. Prior to Mr. Harding starting the mines on a practical basis, there had only been some surface scratching by farmers, who sold what coal they gathered up to local blacksmiths. ..."

S.J. Daily Sun - Oct. 22, 1880 Interest in Mining. - The increased interest which is being taken in mining matters in the Maritime Provinces is rather remarkable in its way. Some very important gold discoveries have undoubtedly been made in Nova Scotia, and in fact there is scarcely a County in that Province in which gold has not been found. The greatest practical development of recent date is probably in Halifax and Yarmouth Counties, where a good deal of mining property has changed hands and some new works are being profitably prosecuted. The oil lands of Cape Breton are now attracting the attention of capitalists, and, as already pointed out in the Sun, immense tracts of land around Lake Ainslie have been secured by Boston and Halifax capitalists, besides what has been taken up by that giant oil monopoly of this continent, the Standard Oil Company. A very large amount of machinery and labor will presently be at work in the development of these oil properties. In our own Province, there have beensome important investments by Boston capitalists in antimony mines at Prince William, York County. Mr. Hibbard, it is reported, has sold the mine in which he is interested for $200,000 cash and $50,000 stock in the new Company and a large force is at work on the property. The Lake George antimony mine is also a hopeful speculation and it is anticipated that the present managers will make a large amount of money out of it, especially as silver has been discovered in the ore. On the Tobique, gold has been discovered in sufficient quantities to warrant an expenditure for pushing forward a thorough exploration.The Woodstock iron mine, as our readers are aware, has changed hands, and large expenditures will be made in developing the property. The Queen Manganese company are not hesitating in incurring large expenditures for the development of their valuable property at Markhamville, while a manganese property in Hopewell has been bought by a local company, and efforts are being made in Boston to organize a company to take hold of the manganese mine at St. Martins. Copper has been discovered back of Dorchester, and the lands are duly bonded, and some Sussex parties have secured a copper mine at Point Wolfe. Kings County is turning out strong in the line of mineral discovery. At Wanamake's, Parish of Upham, galena, which is said to bear both silver and gold in paying quantities has been found. The extent of the vein requires to be still further tested. The Salt Springs of Campbell Settlement have come into notice and changed hands, and a Mr. Bockus, for Boston parties, is putting up the necessary machinery for salt making, and it is expected that operations of some magnitude will be carried on here. Kaolin has just been found at Hamilton's Lake, Dutch Valley, the bottom of the lake being composed of this valuable clay, which is used in making porcelain. At or near Dutch Valley, too, according to a well authenticated statement, indications of oil have been found. Dr. Goodfellow, of Sussex, has found a mineral which appears to resemble bismuth more closely than anything else, but just where it is found has not been made public. Graphite is known to exist in the Parish of Upham. It is to be hoped that through the present extraordinary revival of interest in our mineral resources some practical good may be accomplished. That the Maritime Provinces abound in valuable minerals can not be gainsaid. The trouble heretofore has been the absence of capital to fully test the extent of these resources. In the West and elsewhere it frequently happens that millions of dollars are expended in explorations and actual working before any tangible, paying result is reached. Here there are no millions to be expended in this way - nor even hundreds of thousands, and scarcely tens of thousands. Unless practical miners and geologists are entirely wrong, this very Province of New Brunswick contains all the conditions of a country in which the precious metals, as well as the ordinary minerals, should be found. Possibly the present active enquiry may stimulate to such persistent, thorough survey and exploration of our Province as may lead up to discoveries the benefits of which may be felt by our entire population."

S.J. Globe - May 16, 1887 and Daily Times - May 18, 1887 and N.B. Reporter - May 28, 1887 The New Brunswick Mines. - The New Brunswick correspondent of the Halifax Critic writes: Since my last, nothing new has arisen in miningmatters, except the formation of a new development company in the northern part of the province, at or near Weldford Station on the I.C. Railway, to prospect and explore for coal. The presence of coal has been suspected for some time, as small seams and outcrops have been found from time to time in the vicinity. Opinions differ in the matter. Those professing to know considerable about it that there will not be any quantity or depth of seam found. Be that as it may, the intention is to make an exploration, and a company has been formed with a capital of $75,000 to prosecute work. It is said the Albert Manufacturing Co. atHillsboro are gradually increasing their business, and making occasional purchases of plaster properties in the vicinity of their works. The calcined plaster of this company has a good reputation, and they are meeting with large sales in the Upper Provinces.The work at Mineral Vale, Albert Co., is progressing slowly, and some changes have been made in the mining staff. There is also talk of putting in some new machinery, but of what nature I have not as yet ascertained. The location of this mine, eight miles from railway communication, is somewhat against it on the score of transportation facilities, but time will doubtless remedy this drawback soon, as there is some idea of extending the Havelock, Elgin and Petitcodiac railway branch to Bay Shore, in which case the desired facilities will be afforded. There are rumors of some fresh capital beingplaced in the Antimony mines at Prince William, in York county but nothing definite is known. These antimony properties in York county seem to have been dragged through an endless chain of legal difficulties, and companies have succeeded companies, and stock boomed and then sold for non-payment of calls, &c., till one can hardly form any definite conclusion over the matter. The manganese boom seems to be quiet, though work"

Daily Telegraph - Jun. 15, 1881 Economic Minerals of New Brunswick. - Although New Brunswick is inferior to Nova Scotia in minerals, it still is entitled to consideration in that respect, and it is not improbable that at some not distant day we shall see some new developments in connection with the mineral wealth of this Province. A few words now, (in answer to several correspondents) in regard to the useful minerals of New Brunswick which have been so far discovered. The coal areas of the Province are very extensive, and although the seams are thin, not more than 22 inches, and only worked at Grand Lake and one or twoother places, it is quite possible that they may have eventually be worked much more extensively. It is estimated the Newcastle coal basin alone contains upwards of 100,000,000 of tons, most of which could probably beobtained. When St. John becomes a great manufacturing city this coal will no doubt form an important factor in its prosperity. The Albertite has had a great history, but present appearances are unfavorable to that mining interest. There are several seams of anthracite in theDevonian strata at Point Lepreaux and also at Musquash. It has, however, not yet been determined whether these seams can be worked with profit, owing to the large amount of ash left after combustion. Copper ores have been found in many places inCharlotte, in Albert and elsewhere, but, so far, have not been worked with profit. Baryta, used for making, or rather for adulterating white lead, has been found at Frye's Island, Charlotte Co., where also galena and silver have been found. Minute quantities of gold have been found from time to time in several localities, but nothing has beendone in the way of mining. Argentiferous galena has been found in several localities. At Wannemake's, on Hammond River, the galena has been found to yield a fair proportion of silver. In 1878, on the west side ofMusquash harbor, yellow sulphuret of copper and galena were found in veins of white quartz, to the amount of $14 per ton, as was shown by actual assay. The hardness of the rock and the smallness of the vein are, however, against its profitable working. Considerable quantities of silver have been found in the same locality. Bituminous shales are found extensively inAlbert, Kings and Westmorland, capable of yielding from 65 to 90 gallons of crude oil to the ton, but they are of little value so long as petroleum is so abundant. Bog iron ores, believed to be of commercial value, have been found at Burton, in Sunbury, and also at Maryland in York. Large deposits of iron ore of very superiorquality are found at Jacksontown and other parts of Carleton County. Some of these samples have yielded as much as 48 per cent of iron. There seems to be no doubt that these mines will eventually be worked with profit. Black sand containing magnetic iron ore has been found at St. Martins, in the vicinity of St. John, and elsewhere. Antimony is found in great quantities in PrinceWilliam, York. These mines are worked with profit and the quality of antimony is excellent. It is largely used in making Babbit metal. Manganese is another profitable New Brunswick mineral. It is found at Markhamville, Kings County; in the County of St. John, on the South West Miramichi, and elsewhere. In addition to these minerals, there are manyothers more or less widely distributed. Clay fit for bricks and pottery is abundant. Granite in various colours is widely distributed in Charlotte and Queens, and red granite is largely exported to the United States and Upper Provinces. Graphite, or black lead, is foundnear St. John, and also in Queens county. Grindstones and freestones of the best quality abound, especially about the head of the Bay of Fundy. Gypsum is also abundant inAlbert and Westmorland. It also occurs in Kings and St. John Counties and on the Tobique. Kaolin fit for the manufacture of pottery is found in the granite districts of Charlotte. Limestone is abundant and is found of the best quality about St. John.Iron pyrites is found on the St. John and Miramichi. Saltsprings exist at Sussex and in the parish of Upham. There are other minerals of less value which might be named,but these we have mentioned are sufficient to show that the mineral wealth of the Province is by no means inconsiderable. A survey made with a view to practical economic results, rather than a mere scientific survey, might prove advantageous to the Province."

Daily Telegraph - Oct. 7, 1880 Exhibition. - ... Minerals. - Our Ores Viewed in Their Geological and Economic Relations. - The mineralogical exhibits, though not large, are very complete. This is a branch of our industries which ought to rank next in importance to agriculture, but in our Province, at least, it has not been developed to the extent it has in the sister Province of Nova Scotia. The collection of ores and minerals products belonging to the Mechanics' Institute is the largest and is one of the first objects seen on entering the Exhibition Building bythe main entrance. Albert County is well represented inthis collection by several fine specimens of Albertite, brown shale, on which the Albertite occurs, and gypsum or plaster of Paris from Hillsboro. Various samples of this mineral are seen, as well as the calcined plaster in several stages as prepared by the Albert Manufacturing Co. The useful minerals are of great variety, namely ores of iron, lead, antimony, copper, manganese, zinc, etc., the specimens of copper and iron ores being in greatest quantity. On the upper shelves of this collection aresome fine specimens of antimony from the Hibbard mine at Prince William, and of anthracite from Lepreaux. This last, although not found in great quantity and belonging to an earlier geological age than that in which coal usually occurs, is nevertheless a valuable product. The shale in which it is found is also represented, showing that it bears resemblance to that in which albertiteoccurs. Specimens of argentiferous galena from St. Martins, received from Mr. Wanamake, are also exhibited. Behind the last named collection, to the left, stands that of the New Brunswick Natural History Society, exhibited in geological sequence. Commencing with the Laurentian and Huronian formations, which lie at the foot of the series, we find in the Huronian, barytes, or heavy spar from chance Harbour, N.S., chlorite and hornblende from Kings County and Grand Manan. Next in the scale is the Silurian, in which a large number of minerals are found. We have in this series mica from St Stephen, ironand copper pyrites from various places, galena from Campobello, native copper and zinc blende from the sameplace, and argentiferous galena from Le Tete, Charlotte County. In the lower carboniferous formation, which is likewise one of our most productive in useful minerals, we have calcite in various forms from Miramichi and the North Shore, alabaster from Hillsboro, barytes from Markhamville, agate chalcedony, cornelian, etc., from Washedemoak Lake, and pyrolusite (manganese) and manganite (a kindred mineral) from Kings County.The coal measures are represented by bituminous coal from Grand Lake, copper from Bathurst, etc. The Triassic series are shown by only a few zeolites (stilbite), and heulandite from Grand Manan. The recent formations are represented by selenite, or sulphate of lime in turreted crystals, from Sussex, iron sand from Petitcodiac, wad manganese from Woodstock, and bog iron from Richibucto and St. Stephen. In the same case Mr. G.F. Matthew exhibits a collection of useful minerals, namely, granularanthracite from Lepreaux, bituminous coal from Newcastle,Queen County, polished shale (resembling cannel coal) from Caledonia, Albert Co., Albertite, or Albert coal, from Hillsboro, and peat (burnt) from Lawlor's Lake. Mr. W.F. Best, chemist, has likewise exhibited a neat little collection of useful minerals, such as bituminous coal, Albertite, lime, red granite, iron ores, antimony, pottery clay, copper, lead, manganese, graphite and marble. Mr. Alfred Markham exhibits fine specimens of manganese ores, braunite and manganite from his mine at Markhamville.The Revenue Silver Mining company have a case with specimens of zinc blende, which contains small quantities of gold, about 13-100 oz. Troy weight per ton, and also of silver and lead ores. These are from Letete, Charlotte county. Several specimens of silver-lead ore from Yarmouth, N.S. are also exhibited. A block of Iceland spar from Belledune, Gloucester County, a rather remarkable mineral, is also shown. The Spring Hill Mining Company exhibits splendid specimens of coal of

Codes: 0007 / 0639 / D7 / Z4 / EXPL IDX_Names: Lake George Antimony; Dickson Brook; Kings County Coal;
/ Sussex Coal; Exploration - General;

Headquarters - Sep. 17, 1862 and Philanthropist - Sep. 18, 1862 Valuable Discoveries. - Scarcely a week rolls round in which we do not hear of the discovery in one part of the Province or another of valuable ores. Until the recent gold discoveries in Nova Scotia, few persons could be induced to spend any considerable amount of time in search of the precious metals. Since that time, however, the aspect of affairs has changed. Numbers of the people, fully aware that the geological formations of New Brunswick were similar to those of the sister province, and that if rich deposits of precious metals were to be found in certain localities there, equally rich deposits were to be found in similar localities here, have been diligent and persevering in their researches. At one time we hear of the discovery of rich gold deposits, at another we learn that valuable copper ore in abundance has been found; at one time intelligence is received that valuable coal deposits have been discovered, at another we hear of the discovery of black lead mines. And so the work goes bravely on; and the discoveries increase as time progresses. The News of Monday contains an account of avaluable coal discovery on the property of Alex. Light,Esq., at Sussex. Men were set to work to ascertain the probable depth and breadth of the formation. The largest seam was found to be fifteen inches broad on the surface. Upwards of a cart load of the coal was thrown out, and, when tested, proved to be equal to the best English Orrel. It is of a polished jet black and resembles the Anthracite. The News says the belief at present is, that the supply is inexhaustible, but in order to ascertain with certainty the exact richness of the deposit, Mr. Light intends sinking a shaft to the depth of one hundred feet. Then follows another Copper Ore discovery, but this time in the Parish of Alma, in Albert county, and distant about one and a half miles from a safe harbour to which there is a good and regular descent from the works. The specimen forwarded to this office appears to be exceedingly rich. A mining lease and all the necessary privileges have been obtained from the owners of the soil by a Company incorporated under the name of the ""Williams Mining Company"". Explorations have been made of such character as to warrant the Company in believing the prospects to be very favorable. The vein has been uncovered to the length of one hundred yards on the course east and west, varying in width from six to eight feet; it is found to be stained throughout, and contains rich deposits of grey Copper Ore, some of which has been dressed and shipped to England, and some to the United States; the former producing 28 7/8 per cent., value £20 7s. 0d. sterling per ton; the latter producing 30 per cent., value $122.40 per ton. A large block of the ore from this mine, weighing 300 lbs. can be seen by the curious in such matters at the office of Wm. Davidson, Esq., Princess street. The capital of the Company is set down at $120,000, in 6000 shares of $20 each. We understand that a portion of the stock is yet open to purchasers. Next in the order of discoveries is that of avaluable mine of Antimony at Lake George, in Lower Prince William, York County, by Mr. John Hennebery of Indiantown. A Boston Chemist pronounces the specimen which he has examined a superior article. It appears that this is the only Antimony mine in America. - Courier."

Legislation, etc.;

Daily Tribune - Mar. 9, 1875 The Legislative Council bill, to enable Lake George Antimony Company to hold Stockholders' and Directors' meetings elsewhere than in Fredericton, was committed, Mr. Phillips in the chair. Agreed to. ...... Fredericton, March 9 After routine Hon. McQueen committed the Belleveau,Albertite and Oil Company Bill, Humphrey in the chair. The Bill is almost a transcript of the Bay of Fundy Red Granite Company Act, and the mover explained that should it pass a company will be formed for the purpose of boring for albertite and oil at Belleveau Village. He dwelt on the benefits which would flow from the establishment of the necessary works of the company, and asked for the passage of the bill. Hon. Mr. Crawford said that as there was a section in the bill exempting the property of the company from local taxation, except that for schools, he would move its postponement for three months unless it was struck out. Hon. Mr. Willis and Mr. Davidson argued against the principle of exemption from taxes for the same reasons as those advanced by them against Crawford's Manufacturer's Exemption Bill. Hon. Mr. McQueen said he felt with the gentlemen interested in the passage of the bill that the proposed Company would be the means of enriching the District and County in which it was established, and this claim for exemption was, therefore, a valid one. If, however, the House desired, he would consent to the striking out of the exempting section. Mr. Davidson thought progress should be reported in order that the measure might be closely scanned and its provisions more thoroughly understood. This was opposed vigorously by McQueen, seconded by Smith, and when the exempting section was reached McQueen argued in its favor, and was opposed by Dow, Smith, Smith, Pickard and others, all of whom, however, were in favor of the bill. The section was struck out and the bill agreed to."

Morning Freeman - Oct. 10, 1867 and N.B. Reporter - Oct. 11, 1867 Exhibition. - Minerals. -The show of minerals is not large. One of the most interesting articles exhibited is a box of coal taken from a vein 2 1/2 feet thick, lately opened on what is known as the Cokely farm, by the Grand Lake Mining Company, for which Mr. Scoullar is agent. This coal is remarkable for the intense heat it emits, and its great durability. For the house or the workshop it has no superior we believe. The specimen is clear and bright, entirely clear from all earthy matter or other extraneous substance, and the pieces are of a large size. We were glad to learn that the vein is improving in size as the work progresses. Of course, Albertite makes its appearance, and 8the oils distilled from that singular mineral. the company who have been boring for oil on the Memramcook send a small specimen of some Petroleum they have found, and some lumps apparently of the same substance consolidated. There are specimens of copper ore from various quarters, and of many other ores of sandstone, of sand, &c., &c., and in the Car Shed are specimens of gold bearing quarters, found in the Province, and some small particles of gold. Mr. Matthew's collection of minerals, which seems to be growing more extensive every day, is so large, and the specimens are so numerous, that it would occupy more than one column of our paper merely to give the names of them all. It proves conclusively that New Brunswick possess an immense variety of minerals, whatever may be the value of the deposits. Unfortunately few mines have yet been found to pay for working them. There is a copper ore by J.J. Fellows, manganeseby A. Markham, and a quantity of gold bearing quartz from Victoria county, by W. S. Shea, attracted considerable notice. There is also copper ore by E. Withers, while Mr. Janion shows some fine specimens of the same minerals from L'Etete mines."

N.B. Courier - Jan. 23, 1864 Discovery of Coal. - We have observed in our City papers notions of the discovery of Coal on the railway line, a few miles above Sussex, and we have been at some pains to ascertain the truth of these statements. It seems that about eighteen months since, a lad, who had been fishing in a small stream that crosses the railway, picked up a piece of coal; several months afterwards search was made, and it resulted in the discovery of an outcrop in the stream. The outcrop makes its appearance to the North of the Railway line, near the Dunsinane platform, 55 miles form the City, and about a mile to the westward of the steam saw mill of Mr. Alexander Shives. The seam shows itself on the lands of Alexander S. Light, Esquire, and within a hundred feet or thereabouts, of land owned by Robert Shives, Esquire. The country in the neighborhood is for many miles in extent, quite level, and forms a portion of the parish of Havelock, King's County. As far as we can learn, the coal is of fair quality; and two car loads have been sold in Sussex, and those who have burned it pronounce it a good house coal. That taken from the surface, however, from its exposure to the atmosphere, cannot afford a just criterion of its qualities. Messrs. Gilbert Murdoch, George Stewart, and others, as well as the gentlemen already named, are owners of land in close proximity to the seam. J.B. Key, Esquire, of England, Mining Engineer and Mineral Surveyor, Superintendent of the Copper Mines at Letete, near the entrance to Passamaquoddy Bay, has recently examined the district, and reported thereon. He says - ""On reaching the Station I proceeded in company with Mr. Alexander Shives to examine the spot where coal had been dug out by the side of a brook, as marked on a plan furnished me. Taking a man with us we were enabled to clear up this pit, from which I broke some good specimens of coal. Two seams were distinctly visible, separated from each other by a thin layer of shale, the uppermost seam being about 8 inches thick, and the lower one about 3 6 inches; beneath this last seam I dug out some Lignites. The seams and strata were not sufficiently laid open to enable me to come to a direct conclusion as to their precise dip and bearing; but as far as I could discover, its course will be a little North of East, and South of West, with a Southerly dip. This latter seems to be corroborated by my finding Coal cropping out in the brook about 20 feet to the Northwest of the last named pit, being led there to search for it from my observations of the dip where it was laid open. Two other pits had also been sunk in an Easterly direction from No. 1 pit, in shale, sand stone, and coal. I could not see the bottom of either of these pits, as they were filled in with rubbish, &c., from the sides. But judging from the same taken out from them, there rests no doubt on my present view being thin is by no means a guide, as they have been found in coal mines to swell from mere nothing to 65 feet in thickness; and there is every reason to suppose that similar results will be found in the development of this property."" On opening up one of the seams since Mr. Key's survey, a thickness of 30 inches was uncovered, after going into the bank of the brook only some 10 or 12 feet."

Chignecto Post - Apr. 14, 1881 Mining and quarrying will be prosecuted with increased vigor during the coming summer. Preparations are being made to work the rich vein of manganese discovered last summer at Hopewell Hill; operations ingold and silver mining will be commenced at New Ireland; and copper mining will be actively prosecuted at Alma.Coal mining will also receive some attention in the latter parish. The Albert Manufacturing Company, under the energetic management of Mr. J.T. Tompkins, will, of course, do its usual extensive work in the plasterbusiness, and Mr. McHenry's lime (which is an unusually good article) will probably find a more extensive market.In the freestone quarries, unusual activity prevails. The Bay of Fundy Company are giving employment to a large number of men and expect to do a good business. A short distance from them are the quarries of Messrs. Stevens, while not far from them are those on the lands of F.W. Watson, and for the working of which the International Company has just been organized by Boston capitalists. All these quarries will be busy hives this summer, and on Grindstone Island a large boarding house, for the accommodation of the quarrymen, is

S.J. Daily Sun - Jul. 29, 1886 Mining in Elgin. - A correspondent writes: The mining fever in the parish of Elgin, Albert Co., is daily increasing. The Freeze mine is developing new wealth as the work extends. Messrs. Steeves Bros. & Godard are prospecting on a lead said to be rich in copper and silver. Jacob W. Steeves, while blasting out lime rock onhis farm for

use in the Freeze mine came upon a pocket of pure Albertite coal. He has since made further excavations in the rock and has discovered several small veins of coal running through the lime rock. The general features of the locality are said to correspond to those at the Albert mines, where so much valuable mineral was obtained. Mr. Steeves has about a quart of nuggets of coal, which he has blasted from one of the rocks. It is to be hoped that the necessary capital will be available to develop this and other undoubted genuine mines in this parish."

St. Croix Courier - Apr. 5, 1956 Buchanan in Legislature: - Reviews Mining, Forest Conditions in Province. - Fredericton. - Lands and Mines Minister Norman Buchanan of St. Stephen reviewed mining ..... making specific mention to Charlotte county ...... Interesting. - The minister said nickel in 'the St. Stephen area' and copper on the 'south coast' of the province were still of interest to mining companies. He did not elaborate. '... Speaking of mining, sir, it is like a story I read the other day of a pink and blue surprise party held in one of the homes and after the lady opened all the parcels she said: 'I will tell you of another surprise, I am not expecting.' That is the way it is in New Brunswick. Nobody was expecting any discoveries would be made here. I didn't mean to be rude, sir. 'We might wonder why these mineral finds were delayed. To put it simply, it was because of the terrific overburden, excepting the Brunswick property which will be mined in the open pit method. 'The great difficulty was that the old methods of prospecting wouldn't apply. Prior to the discoveries in New Brunswick, geophysics was somewhat like water witching. They have proved themselves, they have shown their worth and discovered for us that which is going to be something of great importance. 'In geophysics we simply mean the magnetometer and electromagnetometer air and ground surveys. A magnetometer is a survey which measures the variation in the earth's magnetic forces. By these variations and the measures of the variations, different forces indicate different types of minerals. The electromagnetometer measures the phase difference between the current in the primary field and induced current. The measure of these phase differences then indicates to the prospector that there is a certain mineral there but the amount of it has still to be ascertained. Several Methods. - 'There are other things that contribute - geochemistry, which is the analysis of water and soil which indicate the proximity of minerals. 'There is geobotany which is the analysis of leaves and roots which indicates the proximity of minerals. Discovery depends on all of these things being taken together and studied with the use of maps and the study of geological structure, sir, and a high degree of application and perhaps some luck, because many anomalies are graphitic. 'This must be followed up by drilling to indicate the quantity of the quality. As Mr. Glendenning said, delimited as to attitude and grade of ore all done in logical sequence. This, then is followed by a study of the treatment and disposition of these ores which includes research of processing and separation. 'There has been some suggestion that we should be concerned because so much time has elapsed. When we think of other mining operations of this magnitude we understand that seven to ten years is not long to work out these problems. I do not think we should be disturbed. We should be mindful that the first orebodies were discovered in 1953 and their problems are much more complex. Apart from the known minerals we have also, inthe Moncton area, oil. Mr. Elwell from Boston indicated to me they were having some measure of success. The oil shale has been staked and worked on for some considerable time and we hope the young men working on this will come up with something worthwhile. Nickel Here? - 'Several parties have expressedinterest in our salt deposits.'The gypsum plant in Albert county has added new equipment and it would seem they have stabilized themselves.'The cement plant at Havelock is working full capacity and on last report had a full year's order ahead.'The nickel in the St. Stephen area and the copper in the southern coast still suggest interest tomany of the mining people.'The manganese in the Woodstock area at the moment is being treated in a pilot plant in the Niagara peninsula.'Just recently someone brought me a sample of asbestos and I trust it will prove successful. All this is indeed stimulating to our province. ...."

St. Croix Courier - Nov. 4, 1884 and Daily Telegraph - Nov. 21, 1884 New Brunswick at the New Orleans Exposition.- It was expected that the collection of geological specimens from New Brunswick, in course of preparation by Mr. W.F.

Ganong for the New Orleans Exposition, would be ready for shipment the latter part of last week, but a delay of a few days was occasioned by the non arrival of some promised specimens. The collection is now nearly completed and will be shipped in a day or two. As classified, it is a good representation of the economic minerals of New Brunswick. To Mr. Ganong, great credit is due for the labor and time he has expended in preparing the exhibit, as well as to his father, Mr. J.H. Ganong, who will meet the charges of shipment and other expenses incurred. Without their disinterested offering of labor, time and money, the Province would have been entirely unrepresented at what promises to be the greatest display of the kind on this continent during the century. As it is, New Brunswick will make a creditable exhibit in one department, and many, who are entirely ignorant of the Province, will thereby be rendered familiar with its name and one feature of its resources. We append a list of the contents of the cabinet to be forwarded by Mr. Ganong:- New Brunswick at the New Orleans Exposition.- ... Ornamental and Building Stones, &c. Granite:- Dark red, three specimens, polished, dressed and rough; Light red, one specimen, polished; Salmon, one specimen, polished and rough; Gray(Spoon Island), two specimens, polished, dressed and rough - all from the works of Milne, Coutts & Co., St. George. Light reddish grey, one specimen, from the works of H.D. Wallace & Co., St. George. Freestones:- Four specimens, squared and dressed for building; two specimens, dressed for grindstones - all from the quarries of Jos. Read & Co., Clifton, Gloucester County. Whetstone:- Fine-grained, one specimen from Grand Manan, the property of Capt. Pettes. Siliceous Earth:- Two specimens, pure; two specimens with oxide of iron; from Black's Harbor, Charlotte County. Diatomaceous Earth:- Grand Manan. Limestone:- Two specimens, hydraulic and pure, fromFrye's Island; one specimen from South Bay, the property of John Lowry.Slate:- Two specimens, from S. Johnson, St. George. Combustible Materials.-Bituminous coal:- One specimen from Grand Lake. Anthracite coal:- One specimen from Lepreaux. Albertite coal:- Two specimens from Albert County. Mineral Masses.- Serpentine:- One specimen from Frye's Island; one specimen from St. Stephen. Asbestos:- One specimen from Frye's Island. Barytes:- One specimen from Grand Manan; one specimenfrom Frye's Island.Gypsum:- Four specimens. Snowy, anhydrite, selenite, from Hillsborough, Albert County. Ores.- Manganese:- Four specimens. Pyrolusite and manganite.- property of Alfred Markham, Markhamville, Kings County Iron:- Four specimens. Limonite from Grand Manan;hematite, from Woodstock, Carleton County;pyrrhotine, from St. Stephen; pyrite from Frye's Island. Lead:- Galena, three specimens, from Frye's Island, Mascarene and the Elm Tree mine, Gloucester County. Copper:- Bornite, two specimens, Kings County; copper pyrites, four specimens from Kings County: one specimen from St. George; one specimen fromMineral Vale, Kings County; peacock ore, two specimens, Mascarene; copper glance, twospecimens, from the Colonial Copper Mining Company, Dorchester. Antimony:- Three specimens. Sulphuret, 'hard' ore,sulphuret, 'soft' ore; native antimony, from Prince William, York County; one specimen of Sulphuret from Kings County. A few specimens are yet to

S.J. Daily Sun - Nov. 7, 1891 Mining Notes from New Brunswick. - (Correspondence of the Canadian Mining and Mechanical Review). - Without preamble let me say that mining in New Brunswick is comparatively of small dimensions, but there is hope for the future. The mining resources of the province have long lain dormant for want of a full and complete mining law. Last session this was remedied to a great extent, and a Mining Act passed similar in all respects to the Nova Scotia mining act - the only observable difference being in the royalty on gold, which is placed at 2 1/2 per cent., whereas in Nova Scotia it is only two per cent. Much dissatisfaction is expressed by many land owners at the new act, as by old statutes enacted some years ago, all mines on private lands were vested in the owner. The fact of it being so, however, never seems to have stimulated the mining industry in the province, hence the repeal of the same, and a general act empowering the government to issue rights of search, prospecting licenses, and leases on all lands, both private as well as crown lands. It is said the act will be, in many respects, amended during the coming winter. What is done will be fully reported to you at the time. Since the passage of the act, many persons have availed themselves of its requirements, and numerous applications for areas have been filed in the surveyor general's department, over which a number of disputes have risen already and which are being fully considered. Many persons in the province itself, are unaware of the existence of the mineral deposits of New Brunswick, but within its borders may be found most positive traces of gold, galena, copper, manganese, iron, coal (both hard and soft), gypsum, baryta, antimony, iron, pyrites, plumbago, nickel, and traces of tin and asbestos have been met with from time to time. In addition to this there is a strong indication of petroleum, natural gas, salt beds of importance, brine springs, from which the best salt in Canada can be manufactured, mineral springs in abundance, and granite and freestone quarries of the greatest value, and limestone in almost inexhaustible abundance. The famous Albertite coal of Albert County, atone time was the most extensive mining operations ever conducted in the province, from which thousands of tons of the precious Albertite was extracted, and its stockholders became very wealthy from its operation. The supply of the mineral, however, gave out; the mines were abandoned and all the costly machinery in due time removed and sold. Indications of this mineral are still to be met with in Albert, Westmorland and Kings counties, and much time and money has been spent in prospecting for it for years past. There are many who believe it will be found again in sufficiently large quantity to pay for working. In various parts of the province work of exploration is going on quietly for different minerals.In Charlotte County, at St. Stephen, much activity is being displayed in the development of an iron pyrite body which, to say the least, is attracting considerable attention from home and American capitalists. The ore, which seems to be a combination yielding copper, silver, with occasionally some gold, and a fair percentage of nickel is of a very large extent, being quite near to shipment, and in one case on what is known as the Hall farm, has shown a width of 250 feet, and can be distinctly traced for some distance. Numerous assays have shown from 1 per cent. to 2 1/2 per cent. at times of nickel, and considerable work of development has been and is now being done. A number of properties, it is said, have been bonded to American capitalists. What the final outcome may be it is hard to state, but many are confident that a body of ore, rivalling to a certain extent the famous nickel beds of Sudbury, are in this locality. One thing can be stated with accuracy, and that is that the ore from the Sudbury district and the St. Stephen ore are exact counterparts of each other so far as looks and appearances go.In Kings county, near Sussex, manganese exists. The Markhamville mines, which have been worked almost continuously for the past thirty years, are at present not showing up very well. It is said by many the ore is exhausted, while others scoff at such an idea. In other sections large bodies of manganese exist and only await the advance of the capitalists, and a market demand which, while frequently fluctuating, seems very quiet at present. This mineral also exists in good quantities in Albert county and some portions of St. John county. In Gloucester county exist splendid beds or belts of magnetic iron, and also every appearance of large andgood paying galena belts, some of which are being quietly tested, so it is stated, by American capitalists. On one of these veins or belts, assays of the ore have shown a yield of from 10 to 60 ounces of silver, and from 12 to 15 dwts. to as high as two oz. and more of gold in combination.Below St. John, for many years past, considerable money has been spent in the search for anthracite, and those interested firmly believe their efforts will be crowned with success.In York county, it is beyond doubt that valuable deposits of antimony exist. In past years mining operations were conducted there, but the matter assumed more of a stock gambling operation than that of legitimate mining, and together with reckless and extravagant modes of mining, the enterprise got a black- eye, so to speak, and that

Morning News - Apr. 30, 1862 Gold Quartz. - The fact that the Government introduced into the Legislature and carried without any opposition a ""Gold Bill"" to provide for anticipated discoveries of the precious metal, has led some persons to believe that perhaps there is something tangible in the reports which occasionally find currency - of gold having been found in different parts of the Province. What the precise nature of the Act is we do not know, as the members of the House appear to have thought it unnecessary this Session to forward copies of printed bills (in which the public generally take an interest) to the public journals for their information - not even in the case of important City bills which have been drawn up in Fredericton. But we suppose the Royal Gazette will contain it bye and bye. Be that as it may, we have here to notice that during a debate in the House of Assembly, specimens of gold which had been found in Albert County, were handed round among the members, and the opinion was expressed that very strong probabilities existed that important discoveries would be made in that county at an early day. Paragraphs have found their way into thenewspapers at different times respecting discoveries in other places. For instance, it was said that gold had been found at Hampton, and we ourselves have examined specimens in which gold could be detected with the naked eye. Next it was alleged that quartz raised at Chamcook and L'Etete in Charlotte County was found to bear gold; and some of this quartz was sent to a Boston chemist whose report states that there really was gold in it, but ago it was said that gold had been found on the Oromocto River, although this is probably only a repetition of a similar statement respecting that locality, which was circulated several months since - Whether there is any truth in it or not we have not heard. It is alsoconfidently stated that the precious metal has been found near Sackville. Whatever room there may be for exaggeration in the above it is nevertheless quite clear that gold has been found in the Province; and it is our opinion that if the parties who have made these discoveries - even though their labor has been very triflingly rewarded - would persevere with their searches, in the vicinity of theplaces they have taken the gold from, they may yet obtain very profitable returns. It is the belief of scientific gentlemen that gold exists in the Province; and one gentleman in the city who is well informed upon this subject, does not hesitate to say that it will yet be found in the streets of St. John! The number of places in Nova Scotia where it exists, is really remarkable, and all originating out of the Tangier discovery. When it was known that gold was found at Tangier people in other parts commenced prospecting and examining the stones and earth in their own locality. Inquiry was stimulated on all sides, and the desire to acquire wealth in the shortest possible time imparted a keenness to the eyes of ""prospectors"" which they had never before possessed. The result has been the discovery of gold in not one but twenty places - the gold being taken from quartz, as Lunenberg is the only place where it is found in washings. ""A miner"" who has spent some time and money in searching for the metal wrote his experience to the Halifax Chronicle a few days ago. He says he first went to the Lunenberg washings, and although report had exaggerated the richness of the sands, he saw enough to convince him that gold was there in paying quantities, requiring only improved appliances for separating it to make highly remunerative work. He next visited Tangier where, he says, the appearance of the quartz (to an unpractised eye, at least) indicated no great richness; and for want of proper ""crushers"" it was impossible to say whether money could be made or not. [This was before the introduction of good crushers for extracting the gold. We wish our readers to note the last paragraph particularly as we shall refer to it again.] The miner next went to Wine Harbor, Isaac's Harbor, Laidlaw's farm, and Sherbrooke. In all these places gold had just then been discovered, but there was no proper machinery for extracting it from the quartz; consequently it was impossible to tell the extent of its richness. After examining all these localities he has at last settled down at Sherbrooke, which he thinks affords the best field for the investment of capital, skill and labor. This person insists particularly upon the necessity of erecting quartz mills for extracting the gold, believing that without them the labor of the miner goes for nothing. He says that at Sherbrooke gold can be found anywhere in the ground over a pretty large area; and this being evidently the debris of the quartz, it shows that the ""leads"" must not only be rich but very numerous. Now, the point to be noticed particularly is that quartz may really contain gold, and yet the precious substance may not be visible to the eye. It would be a great mistake in a miner to throw away quartz simply because he cannot see the gold in it at once. If this plan had been adopted at Tangier and other places the mines would have been abandoned at once, and we would have heard nothing of ""nuggets"" which have occasionally turned up by the persevering men who have been at work there. It seems to us that if there be good reasons for supposing that gold exists in New Brunswick - or if (as has been the case) gold has really been found - the proper way would be to keep on searching and digging, and not give up simply because a man cannot see the gold shining out of every piece of quartz he turns up. The great fact being once established that gold does exist in a certain locality, is the main thing to look at; and after that patience and perseverance will probably have their reward in this field of industry as in every other. We have an abiding faith in the probable discovery of gold in this province; and for the following reasons. The character of the rocks in many places is similar to what it is in countries where gold has been found; the opinion of scientific men who have made the subject their study is decidedly in favor of the existence of gold in New Brunswick; then there is the fact that it has been found on the Canadian frontier on the North of us, and in all parts of Nova Scotia on the south east. But, the most powerful reason of all is that gold has already been found in two or three localities in the Province. If the same inquiry be made, the same intelligence displayed in searching for it in New Brunswick as has been done in other countries now celebrated as gold fields, the result may be the same. We say, then, to those whose turn of mind leads them in search of gold among our rocks, not to be discouraged if they do not immediately make a lucky hit. The California mines were not discovered until a few years ago. Australia - until a quarter of a century ago - was only looked upon as a place for the reception of convicts. It took a long time to find out that gold existed in Nova Scotia; and it was only yesterday (as it were) that the amazing wealth of British Columbia and New Zealand was known. Discoveries in all these countries have been sudden; but when ""the ice"" has once been broken new proofs of gold discoveries have flowed in from all sides. The same luck probably awaits us; and who knows but we may awake some morning and find ourselves the happy possessors of a country which will be able to boast of as extensive

Codes: 0041 / E2 / IDX_Names: Jordan Mountain Copper; Oil and Gas - Kings Co.;
Kings County Record - May 28, 1909 Mineral Wealth of New Brunswick. - Editor Record, Sir, I noted with pleasure your remarks on the mineral wealth of New Brunswick and can only say that it is a good policy for the Record to adopt and especially where the interests of Kings County is concerned and it is perhaps an important point to note still further that in nearly every case where there is a mineral deposit existing in Kings County it is within easy reach of Sussex, hence Sussex in any move that is made in the future should be a central and controlling point. The question of oil and gas in the Sussex valley is undoubted, as every fact to point to such an existence is plain to be seen and as you state was pointed out by the late W.N. Goold years ago. This field, however, isowned and controlled by the successors to the New Brunswick Petroleum Co., the Maritime Oil Company who are now developing the oil field in Westmorland County at present energetically and I personally not long since interested the Company's manager and have every reason to believe some developments will be undertaken in this vicinity in the not distant future.The late reference to Jordan Mountain copper mine"

Royal Gazette - Sep. 21, 1841 and N.B. Courier - Oct. 2, 1841 and St. Andrews Standard - Oct. 8, 1841 and Weekly Observer - Oct. 5, 1841 The following letters from Dr. Gesner to His Excellency the Lieutenant Governor, which have been handed to us for publication, contain much interesting and valuable details, in addition to those already beforethe Public of that gentleman's scientific labours in his geological researches in various sections of the Province:- Saint John, 17th June, 1841. Sir, - I beg leave to state for the information of His Excellency, that I have just completed a section across the country from St. Stephen's (Charlotte County), to Fredericton, in the direction of the new road now opening between those places. I have examined the uninhabited country on the Magaguadavic River, Loon Lake, Oromocto Lake, and the Wild Lands adjacent. Somewhat contrary to my expectations,, I find there are large tracts of excellent land in this quarter, with occasional traces of intervale. Many of these lands are as I believe ungranted, and would afford excellent situations for immigrants. On the south east side of the Magaguadavic, where it is crossed by the road, there is some rocky and elevated ground; but these ridges are met by excellent soils which are capable of successful cultivation. The rivers are navigable for canoes, and abound in fish, (trout, &c.), but the most important circumstance for the new settler, is

the opening of the beforementioned road, whereby access can be had with the sea shore for fish, and finally for a market; and also with the capital of the Province. The inhabitants (twenty six families) in the Harvey Settlement, are in a prosperous condition, and other Villages might be established, on some of the tracts alluded to. These circumstances will be communicated to the Board of Emigration here, and I have taken this liberty, knowing the interest His Excellency feels in Emigration, the best means of improving the condition of the country. The Coal Field is found to extend farther in this direction than was expected. The particulars concerning it and minerals in this quarter will be fully set forth in my report for the season. I intend leaving town on Monday next to explore the Schoodic River along the American line to the Monument and Eel River, and will if it shall seem necessary, communicate to His Excellency anything of importance which may be discovered on that tour through the Wilderness. I have the honor to be, Sir, Your most obedient, humble servant, Abraham Gesner. To Alfred Read, Esquire, Private Secretary, &c. &c. ---------Saint John, August 5, 1841. Sir, - I have the honor to inform you for the information of His Excellency, that my explorations have been recently directed to parts of the counties of Carleton and York.The most important examinations have been those of three several deposits of excellent iron ore, on the farm of Colonel Ketchum, at Woodstock. This Ore was discovered by the inhabitants several years ago. It is a compact red hematite, which will yield from 50 to 60 per cent of cast Iron. The united thickness of the beds is seventy five feet. The situation of the ore in the original forest of the country, and its inexhaustible quantity, offer every advantage for the manufacture of iron, and being placed on the American frontier, and high road to Canada, its value is much increased.Two remarkable Medicinal Springs have been found to exist on the Keswick River, about eighteen miles from Fredericton; the water has not yet been submitted to Chemical analysis, but it is evidently calculated to relieve several kinds of disease. Some singular discoveries have been made in regard to the change in the level in the Saint John. Below Woodstock the River has asserted its ancient bed, which is upwards of thirty feet above the present channel. This circumstance accounts fully for the terraces or steps of the valley at Woodstock. It affords me much pleasure to state that there is every prospect of a good crop, and the inhabitants of new settlements under their prosperity appear contented and happy. I have the honor to be, Sir, Your most obedient, humble servant, Abraham Gesner. To Alfred Read, Esquire, Private Secretary, &c. &c. ---------Saint John, 27th September, 1841. Sir, - Having recently made a geological examination of the county of Kent, and a part of the County of Northumberland, I beg leave to transmit a brief report of my explorations, agreeably to the request of His Excellency the Lieutenant Governor, for whose satisfaction it is submitted. Information had been received, that indicationsof coal had been seen at the Tedish River, in the county of Westmorland, near the site where the probability of its existence had been previously noticed. Upon an examination of the banks of this River, the outcropping of coal measures was discovered, with a superficial stratum of Coal, eight inches in thickness. The occurrence of the usual shales with a perfect and continuous stratum of coal, renders it almost certain that there are far more extensive deposits beneath, which, from the horizontal position of the strata, do notappear at the surface. Another outcropping of coal was discovered by my son, on a Branch of the Cocagne River, in the county of Kent, and within two and a half miles of the harbour. The superficial coal stratum at this place, is situated in the bed of the stream, three feet beneath the water, which renders its admeasurements difficult, unless the rocks were bored. It appears, however, to be sufficiently thick to be worked advantageously, and the inhabitants are now preparing to raise a quantity of it for domestic purposes. Outcroppings of coal also appear on the Buctouche and Richibucto rivers; but the situations where the upper Coal stratum appears in this quarter, are too numerous to admit of having their particular details given on the present occasion. The discovery of coal in this part of the Great New Brunswick Coal Field, is important, in regard to the proximity of this mineral, to the site where the anticipated canal to unite the waters of the Bay of Fundy and Gulf of St. Lawrence, will probably be fixed. The whole of the county of Kent is situated on this vast coal field, which in this quarter presents a broad level surface, not elevated upon an average, more than twenty five feet above the level of the sea.A deposit of bog iron was found at Richibucto, and which might be worked with the coal in this vicinity. Having examined the banks of the principal streams of Kent, I next proceeded to the exploration of the Miramichi River, in the county of Northumberland.Coal exists here also, and thin strata appear about five miles below Chatham, and on the Bartibog River. It also appears in the banks of the Southwest Branch of the River, and numerous other situations near Boiestown, the Ranous stream and others. The rocks of this coal field will supply excellent freestones, flagging-stones, and grindstones. They abound in the remains and impressions of plants which are analagous to those now growing within the tropics, and such as could only have flourished in a warm climate, being entirely different form any now living upon the surface beneath which they are buried. The strata in general are covered by a deposit of debritus and beds of clay and sand, the whole averaging about four feet in thickness. The soil in general is light and sandy, and there are extensive tracts of a good quality of land. Almost the entire surface is capable of cultivation. Notwithstanding, there are occasional Carriboo bogs, and sandy barrens, unfit for settlement. An immense tract of country bordering upon the Miramichi, and its branches, was overrun with devouring fires in 1825. The groves of pine were robbed of their foliage, and still stand in leafless trunks amidst the underbrush and other kinds of wood, which are destined to succeed them. As this part of the country is low and level, the rivers are navigable some distance from their mouths; and the streams are not broken by falls and rapids, so as to prevent the passage of boats and canoes. From the Southwest Branch of the Miramichi, we descended the Nashwaak to the River Saint John, and found that all the rocks along this stream belong to the Great Coal Field, the boundaries of which will be reported when its North Western limits have been ascertained. The attention of the inhabitants heretofore appears to have been devoted almost exclusively to the transportation of pine and other kinds of timber, formerly abundant in this part of the Province. The best interests of the Country do not appear to have been advanced - agriculture has been much neglected - nor does the trade in timber seem to have been profitable to those who have been engaged in it. The inhabitants are settled along the banks of the principal streams. Remote from these, the country is in its native wilderness state; except where the lumbermen have removed the largest trees, or such as were adapted to the English market. Most of the rivers are lined on each side by tracts of excellent intervale. Many of these tracts still remain unreclaimed by the hand of industry. These intervales like those on the upper part of the Saint John, are remarkable for their terraces, which have evidently been formed by the bursting of lakes, and changes in the level of streams, by the lowering od their beds. Four of these terraces appear, are seen at some situations, and there are instances where the former beds of the streams are now covered with graceful elms. Some of the most extraordinary Geological facts in this Division of the country are seen in the evidences of changes of level. At Bathurst the country has been uplifted, while at the mouth of the Miramichi, the shore has been depressed within a comparatively recent period, and large peat bogs are now buried beneath the sea. A visit was made to a mining establishment of anEnglish Company at Bathurst, conducted by Mr. Stevens, a most enterprising individual. The first efforts of the Company were directed to the mining of Copper Ore, veins of which are evidently contained in the slates of Tete-a-gouche River. At present the mining of manganese is carried to some extent, and powerful machinery has been erected with sufficient water power, which will be directed to cleaning the Ore, and other operations. The Mine of Manganese is situated eight miles from the Town of Bathurst, the one occurs in veins and disseminated masses in Clay slate. Fifty tons were ready to be shipped at the time of my visit. The sterling price of the Ore is stated to be ten pounds to the ton. This is evidently a mining district, and one of great importance to the country. I have also analysed two kinds of marl in the county of Gloucester. They are superior in quality, and will soon be applied to agricultural purposes. The counties of Northumberland, Gloucester and Restigouche, are evidently rich in mineral wealth, and I regret that my examinations could not be extended to them this season. My object has been to complete the

The Mining Review: A Monthly Record of Geology, Mineralogy, and Metallurgy. - Oct. 31, 1840 and N.B. Courier - Nov. 28, 1840 and Miramichi Gleaner - Dec. 22, 1840 Geology and Mining Prospects of Gloucester and Restigouche, New Brunswick, by W.J. Henwood, F.R.S., F.G.S., &c.- Some gentlemen with whom I have the honour to be acquainted, thought fit to repose sufficient confidence in me to send me to New Brunswick to inspect the geology and mining prospects of the counties of Gloucester and Restigouche. My report comprised an abstract of the geological characters of the district, and remarks on the economic portion. The first I am, of course, at libertyto make use of - the second, as it was a private affair, I am not at liberty to disclose. Taking the rocks of this portion of New Brunswick in the standing order, the lowest consists of granite, not very different incharacter from our Cornish granite. This is utterly devoid of mineral veins. On this reposes a thick-bedded slate, which Dr. Boase has called ""cornubiant"", and of which the types may be found at Dolcoath and Cook's Kitchen, in this county. This is traversed near the point of junction with the granite, by numerous granite veins, and also by other veins of sulphur much resembling our Cornish elvans. At still greater distance from the granite, the rock becomes deep blue, of a silky lustre, and very thick bedded - in fact, very like the blue killas of the Gwennap district. In some portions of this, I discovered remains of encrinites and numerous isolated pipe-like or vermicular masses of the grey oxide of manganese. This is very peculiar, and of a character that I never before met with. This mass contains veins and irregular patches of greenstone, in no way distinguishable from that of North Roskear, or St. Just. But this is also without mineral veins. Reposing in a comfortable manner, as regards the laminae of the slate, are certain beds of conglomerate, well exposed in the 5 banks of the Tattigouche. These conglomerates seem to belong to the coal measures, and numerous sandstones and conglomerates, belonging to the same formation, repose conformably on the granite before mentioned, and perfectly horizontal in the banks of the Nepisiguit. In this, ferns, and other plants of the coal measures, are found in great abundance. The beauty and the extent of these coal measures it is almost impossible to describe. In fact, we pass over nothing else from Fredericton to Miramichi, and thence to Bathurst, a distance of at least 150 to 160 miles. They consist of various beds of sandstone, shell, and conglomerate, with numerous thin seams of coal, few of which are not more than a foot or two in thickness. The whole of the district is particularly rich in fossil flora. In one of these beds, a blue shell, containing fern and other plants, is a peculiar formation of copper, specimens of which have been shown to Mr. Carne, Mr. Fox, and other gentlemen conversant with copper formations, and they, I believe, as well as myself, never saw anything like them. Specimens of lignite, impregnated in the laminae as well as in the fracture by rich vitreous copper ore, and coated with green carbonate of copper, and isolated and detached nodules, from the size of a filbert to that of a walnut, sometimes wholly consisting of vitreous copper ore - Sometimes the nucleus of these in the external parts of common pyrites - and sometimes the interior of copper pyrites and the exterior of vitreous copper. So persuaded was I of this formation being a unique one, that when specimens of lignite containing vitreous copper ore and nodules of the same substance were shown me at Halifax, on my way home, by the Hon. Samuel Cunard, I thought I at

once recognised them as Bathurst specimens, which they were exactly alike; but, to my astonishment, I was informed that they were not from that locality, but from the neighborhood of Pictou, in Nova Scotia, and that they were found there in considerable quantities, under precisely similar circumstances, in the coal formations which were worked there. This neighborhood has received considerable elucidation from the labours of Mr. Gesner, the provincial geologist of Nova Scotia and New Brunswick, whose works are, perhaps not sufficiently known or appreciated in this country; for in a new and unexplored region of this kind, much labour is unavoidably wasted in the mere mechanical process of moving from place to place, which in a civilised and cultivated country like our own, may be at once applied to the pure geological work of examining the rocks. Mr. Gesner has presented the Royal Geographical Society of Cornwall with copies of his works, and has promised us a series of geological specimens in illustration of them. It is, perhaps, also due to Mr. Gesner's individual labours, to say that he has at his residence in St. John's, New Brunswick, an admirable museum, wholly fitted 6 up by himself, illustrative of the geology, botany, and fauna of New Brunswick and Nova Scotia, which should be seen by every visitor to that place, and which, through the politeness of the proprietor, is freely open at all times. Serpentine occurs in isolated masses in several parts of the shores of the Bay of Chaleur. On one part of the shore of this bay I discovered remains of turbinolia, encrinites, and other organic bodies, which are the precise counterparts of some of those on the table presented to us by the liberality of Mr. Peach, of Goran, of this county. In fact, the resemblance is so close in mineral character, structure, and every other particular, that if they were mixed I believe it would be impossible again to separate them - and, indeed, they mark the same epoch of formation. In many parts of that bay, and in many places on the banks of the river Restigouche, which divides New Brunswick from Lower Canada, are seen trap dykes, and near Dalhousie on that river, between two such, I discovered a fine series of the Silurian rocks of Mr. Murchison, particularly rich in organic remains, many of which I have reason to believe, are quite new. Similar rocks are exposed to a great extent in the cutting of the Erie Canal, at Lockport, near Niagara. These have been examined and described in detail by the state geologists of New York, who have discovered many novelties among them. Large collections of these are on their passage; and whether it may be best for the interests of science that they should be placed in this society's collection, or whether it may not be better to hand them over to the inspection of that most accomplished geologist, Mr. Murchison, is a question on which I venture to give no opinion. But I am prepared to dispose of them in that manner which may be thought best and most useful to science. In reviewing these formations, according to the theories of modern and eminent geologists, the slate rocks will be considered the older formations - the granite next in age, its veins being injected through the slate - whilst the coal series deposited on both, but containing no vein of granite, will be considered the more recent of the whole. This, I believe, in conclusion, is an abstract, and a brief one, of the labours in which I have been engaged for three or four months past, and which, when opportunity offers, I may work out in more detail, and place it either before this society, or some other, where it may be most generally useful. Read at the late meeting of the Royal Geological Society of Cornwall, a detailed report of the interesting proceedings appeared in the Mining Journal of the 24th instant."

Kings County Record - Mar. 18, 1921 Albert County Rich in Minerals. - Much Activity in Mining Work Being Carried On. - Albert Tribe of Sussex Made Valuable Find of Coal at Owls Head, Alma. - There is much activity in mining circles in Albert county, at the present. At Hillsboro, where more men are employed in mining work than anywhere in New Brunswick, except the Grand Lake coal regions, the Albert Manufacturing Company, of which Hon. C.J. Osman is President, is enlarging their plant so that the output of gypsum, andgypsum products will be about doubled. And one or two smaller companies are increasing their output. At Albert Mines, the site of the former Albertiteproduction, men are seeking the veins of this mineral, which are generally believed to be quite as rich as the ones formerly mined. The company promoting this work are said to be satisfied that the development of this property will soon reach the proportions of the first operation at Albert.At Rosevale, another company is erecting a plant of large dimensions for the purpose of extracting oils from the extensive beds of shale that exist in thatdistrict, and in the hills of Lumsden, back of Albert, a veteran prospector is seeking the vein of gold that was found and lost by a man named Steadman, fifty years ago. This man, Mr. B.F. Fales, worked with Steadman at that time, and is confident he can locate the vein. According to tradition it was rich in gold. Down at Owls Head, Alma, a promising vein of coal has been discovered, and sufficient work has been done to prove that it is not a pocket, but a real vein six feet deep. This was located, not buy a prospector, but by a carpenter employed at Alma, Mr. Albert Tribe, a native of Sussex, Kings County, who noticed the coal on the cliff as he was walking on the beach, and after hours, dug out a quantity and tested its burning qualities, and being satisfied, continued digging until the vein was discovered. It has long been recognized that Albert county is very rich in minerals, probably more so than any other county in the province. Beside the above mentioned, there are extensive deposits of manganese and copper. Manganese has been mined in past years, but so far there has been no attempt to develop the copper mines, although there has been sufficient test work done to indicate vast copper deposits."

Moncton Daily Times - Mar. 11, 1910 Fresh Interest Taken in Mineral Resources of New Brunswick. - (Bradstreets). - There is a growing interest in the mineral resources of New Brunswick, which is partly due to the development of new iron mines in Gloucester county. A company working there is said to have discovered rich ore and is installing a plant to raise 2,000 tons per day. Seventeen miles of railway to connect with the Intercolonial is nearing completion, and shipment of ore will be made from Newcastle on the Miramichi until proper facilities can be provided at Bathurst harbor near the mines. It is announced that an excellent deposit of coalhas been discovered in the same county, which seems to point to the establishment of a smelting industry. During the last year forty seven licenses to search for minerals in Gloucester county were issued and seventy for other parts of the province. Coal, iron andantimony are now mined, besides extensive lime, plaster and granite industries. Other parts of the province arereported to show oil in paying quantities."

Codes: 0069 / T8 / IDX_Names: Austin Brook; Gloucester County Coal;
Campbellton Graphic. - Mar. 26, 1909 Gloucester County is Rich in Coal. - The Tracadie Coal Company Commences Operations on ..?.. - St. John, - A prominent Bathurst man, who was in the city yesterday told something about a big coal discovery in Gloucester county, after boring with a calyx drill for one year the county proved to be a solid coal bed. Borings have been made at different places near where the cropping of coal showed at the surface. In one place was found a bed of coal two and a half feet thick at 33 feet below the surface and another rich bed about five feet thick at 500 feet below the surface. The coal is of a better quality than the Pictou. There are also valuable deposits of fire clay. The Tracadie Coal Company, who own a large tractof the coal region, are awaiting spring to resume operations. It will take some time to properly prospect the whole area where coal is showing up. Their engineer claims from the run of the leads he went through at different places that a ten foot seam can easily be located which, in connection with the Drummond iron works at Bathurst, will certainly create an extensive industry, within that county."

Codes: 0087 / 0688 / Y1 / L3 / IDX_Names: Dorchester Copper; Gold Mine Gully; Salt Springs Salt;
Beliveau Albertite and Oil / Gas;
S.J. Daily Sun - Oct. 16, 1880 Mining Notes. - Work is still being carried on at the Woodville Copper Mine near Dorchester, in hope of getting to main lead or large enough quantity of metal to prove capable of working permanently and shipping or manufacturing on the ground. The Beliveau Albertite Co. still carry on work,notwithstanding the changes and grumbling of impatient stockholders. It is understood Mr. Byers of Albert Mines fame has visited this mine on a tour of inspection, and though his views are not made public it is thought by outsiders they are generally favorable to its ultimately becoming a success. The discovery of a large body of what is supposed to be silver bearing ore in Albert County, on the Hopper Farm, and bonding of the same by Dr. Goodfellow, of Sussex, and associates for a large amount, causes considerable speculation. What will be the ultimate result is as yet unknown, but no doubt the lessees see millions in it. It is understood that a Dr. Parker of Boston,either by himself or with other associates, has purchased the Salt Springs at or near Campbell Settlement, Kings Co. It is understood they intend developing them on a large scale, and also intend boring so as to get at rock salt if possible that probably underlies that locality. Nova Scotia gold...... ..... A fine vein of Galena ore, containing lead,silver and gold in good quantity, exists at Hammond River, N.B., and is at present leased by some gentlemen in Albert County, N.B. They have bonded the same to a party from Westmorland County, who is now in negotiation with some reliable Boston capitalists for the purchase for the same. A mining expert is shortly to arrive for examination of the property. It is said it is one of the finest ore-producing veins in the Province and will undoubtedly prove very rich if properly developed. If not sold within a reasonable time steps will be taken to form a local company for development of the same."

Codes: 0087 / 2038 / E2 / IDX_Names: Dorchester Copper; Grand Anse Copper; Oil and Gas - Kings
Moncton Daily Times - Oct. 27, 1882 Mining Items. - Major Howell, of Boston, who has been successfully operating for copper on lands owned by Charles Crossman and others, at Dorchester, is negotiating for a sale of his mine to Mr. John Ely & Co., of New York. Mr. Amos A. Mooney, of Boston, has been in Dorchester the past week and has purchased some valuable properties there and instructed Mr. Chapman to put on ten men at once and develop it, which will be done. Messrs. Richard and Chapman have sold part of their Babcock property at Grand Aunce, to Mr. W.H. Tower, of Boston, for a good figure, and work is being prosecuted rapidly. They have now one shaft sunk adistance of about forty feet, where they find a high order of copper ore, and one incline, all of which shows a good average. Mr. Rufus S. Merrill, also of Boston, has takenup considerable land near St. Joseph's, Dorchester, for the purpose of boring for oil. There are several wells bored and in one, at the distance of thirteen hundred feet, the men broke their drill, and have experienced no little difficulty in getting it out. Mr. Merrill has obtained the services of a Bradford gentleman, and they hope in a short time to either drill through the old drill or get it out. Last Friday they unfortunately lost their pump with five hundred feet of rope attached, which will delay them considerably; though in spite of thirteen hundred feet of water, a heavy iron drill and pump and rope, they manage to get about thirty gallons of lubricating oil per day, which flows at the surface. Mr. Merrill has returned to Boston for the purpose of forming a company and obtaining machinery and will return in a week's time. - Post."

Progress - Jun. 2, 1894 Dreaming About Gold and Put Their Money in a Holein the Ground. - The truth about Mining Ventures at Dorchester - How the Fever is Kept up - A Scheme at Present on Foot to Float Stock and Raise Money. - Dorchester, the shiretown of Westmorland County is noted for its quietness. It possesses one of the finest cemeterys to be found any where. Its people are justly proud of it. Mark Twain tells us the people of Bermuda base their pride on their onion, it is their symbol of excellence. A Bermuda father, he tells us, in sending a son forth in the battle of life, councils him to be an onion . A friend, in praising another, bankrupts applause when he says he was an onion . In a like manner the influence of Dorchester's cemetery permeates the whole community; quiet reigns, a Dorchester man never laughs, they all wear funereal visages. The influence shows itself in another direction, their fondness shows itself in another direction, their fondness for digging; having nobody to plant, it takes the form of digging for buried treasure. An old resident who knows most everything, particularly matters of ancient history; tells me, however, this characteristic is due to the influence of a man who died in A.D. 1802. This man was known to everybody as Uncle Billy (I have forgotten his other name). Uncle Billy was the seventh son of the seventh son, and he dreamed three times of buried treasure, but failed to locate it, or to specify its kind. He intended to have dreamed it all out later, but dying suddenly he left nothing behind to show whether it was bullion, gold in its natural state, copper or albertite coal. About fifteen years ago an old lady at Jolicure dreamed three times of buried treasure thereabouts, and a few days afterwards a cow in crossing a field put her leg down a hole; the owner of the cow upon investigation, found a peculiar shaped hole filled nearly full with earth of a different kind from the surrounding earth. It was at once concluded Capt. Kidd had been around there burying treasure. A strong company was formed and excavation continued for two summers, when at the depth of 150 feet hard pan was struck and the work discontinued. It then turned out that the old lady was not a seventh daughter after all, hence the disappointment. She was just an ordinary old lady and dreamed the same as other folk. I have visited the spot and like everyone for miles around, have viewed the hole. It is as nice a hole for the money as can be found anywhere. Dorchester's oracle was not responsible for this failure, it was hardly to be expected he was going to dream treasure for the Jolicurians. Before proceeding I must say the Jolicure hole is one of the institutions of the place, some visitors however, have not shown an appreciation of it, they remind me of Mark Twain's story of the blue-jays finding a knot-hole in the roof of an old building and starting in to fill it up with acorns. After working for hours, and from time to time looking down the hole to note their progress they got mad and went to work to fill that hole or die. After three days hard labor one of the jays happened to look in at the window and discovered they had been firing acorns on the floor all the time. The joke on them was so good that the birds from all parts came to look down that hole and laugh. They all appreciated it except an owl from Nova Scotia who took it in on his way to the Yosemite Valley, he said he saw nothing funny about it, he could show better knot holes in Pugwash, N.S. Returning to Dorchester, the people here occupy the most of their time discovering mines. It is considered a dull day when a mine is not discovered. I came nearly being a mine owner myself last fall. A local company were taking up a property and offered to let me in on the ground floor as they called it for $700. Being out of funds I had to let it slip

me. How true the words There is a tide in the affairs of men, etc., etc. A number of years ago Albertite coal cropped outat Beliveau Village, Dorchester, and a strong company was formed and spent a lot of money to procure a few pounds of it. Later copper cropped up in the vicinity of Dorchester and an American company and a local syndicate vied with each other for its possession. They went chasing each other around with special trains and finally the American company got the copper properties, thus securing another of what should be a Canadian heritage. The Americans built some fine buildings, put up a mill and took four kerosene casks of ore away with them. The latest developments are, as you of course know, the gold mines of Memramcook, Gouldville and other points in this parish: the discovery that gold existed here was made by a medical gentleman an adept in the manipulation of the hazel rod. He had been prodding around Nova Scotia and other parts of New Brunswick with indifferent success, and finally he ran against this conglomerate . It is stated the pay dirt was formerly used for ballast on the I.C.R. and that the electricity generated on the wheels and friction took up the precious metal and adhered it to the wheels and that a wheel scraper in the car shop at Moncton had been secretly scraping it off and growing rich. The beauty about these mines is, that the gold runs all alike through the conglomerate, thereby assuring one of a steady output and none of that uncertainty experienced in placer mining and nugget out- crop. Mr. J.B. Neilly of Halifax is the chief promoter of the property at Memramcook and is now making a tour of New Brunswick accompanied by an ex-M.P.P. who is an interesting talker but at present out of a political job. They are disposing of shares, it being their idea that when you have a good thing you should pass it around for the general good. Joe Gould, an Acadian resident of Gouldville, called on me the other day and after getting the loan of a dime wherewith to buy Havelock water , intimated that on his next visit to town he was going to put me on to a gold mine. He had had a dream, he only wanted to have another dream at it before telling me about it. If any of your readers want to go into the gold business come to Dorchester. It is enjoyable, refreshing and exhilarating employment. Joe Gould says the Gouldville party last year had a perfect round of picnics and that the vicinity of the mine where they had the old Frenchman digging, is strewn with the exterior covering of Buchanan enough he says to patch a sheol a mile. Joe uses the revised version."

Moncton Daily Times - Jul. 26, 1880 Shipment of Stone for Boston. - The schooner Stella R. cleared from the Stevens Quarries, Mary's Point, A. Co., on Saturday, with about 100 tons of building stone for Boston. S.J. Daily Sun - Jul. 28, 1880 Mining Notes. - American capitalists, under the energetic direction of Mr. Couch, of Newburyport, Mass., are about taking active steps to develop the copper mine at Woodville, near Dorchester. Should trial shafts prove the property to be as valuable as is anticipated, the original owners will doubtless make a handsome sale of the same. The escape of gas on the level and shafts of the Beliveau, Albert County, is something marvelous, having increased lately very rapidly. The level is now within ten or twelve feet of the supposed locality of the bore holes, and the growing conviction in the minds of those interested is that Albertite is close at hand. Should it prove so, it would be of immense value to that part of the country. The discovery of a valuable bed of copper was reported some time ago by parties on the Gulf Shore near Malagash, N.S. Sheriff McLean, of Amherst, N.S., is said to be personally interested in the same. Nova Scotia lead, Nova

St. Croix Courier - Mar. 3, 1955 Mining Picture.... - The established mining industry reached a record production in 1954 with the value of products estimated at $12,600,000. These were all nonmetallics. Coal was the most important with a record production of more than 784,000 tons and a value of 6 1/4 million dollars. Although progress might be considered to be slow in the development of base metal deposits already discovered, it must be realized that work of this magnitude takes a long time. Actually the rate of progress in New Brunswick has been exceptionally rapid. Going Ahead. - Work is going ahead on the development of base metal deposits already discovered and in prospecting and proving up other deposits. You will remember that the surface installationsat the Keymet Mine were destroyed by fire last March, just a few days before the official opening was to have taken place. The company proceeded to rebuild their installations immediately and as a result of efficient and rapid reconstruction the mine commenced operation in October of 1954. The first lead-zinc concentrates in the history of New Brunswick were then produced.Late in 1953 work was resumed at the Burnt Hill tungsten mines, a property which had lain dormant since 1917. A number of buildings and crushing and grinding plants have been constructed and production of tungsten concentrates was begun in the early fall of 1954. Preliminary Shaft. - On the Anacon property of Brunswick Mining and Smelting Corporation Limited a preliminary shaft was completed to a depth of 412 feet. Levels will be developed from this shaft at depths of 200 and 300 feet. Plans call for a much larger production shaft to a depth of 1,850 feet in the initial stages and possibly to 4,200 feet. Ore from this first shaft together with that from the open cut operation at the Austin Brook property will be taken to the company's pilot mill which was completed some two months ago. The pilot mill represents an expenditure of more than one- third of a million dollars and will treat 150 tons of oreper day. It is designed to test the ore in preparation for full-scale production. The present plan is to erect a 4,000 ton concentrator following completion of testing work in the pilot mill.At the New Larder 'U' property a similar shaft is being put down and has reached a depth of 360 feet. Plans call for a depth of 1,500 feet. During 1954 the major discovery was the high- grade lead-zinc-silver-copper deposit found some 32 miles northwest of Newcastle by the American Metal CompanyLimited. This is the third very large lead-zinc-silver- copper ore body that has been discovered and proven in two years. Shallow shafts are being put down preliminary to actual mining operations. This company has a fine record of achievement with a background of successful operations and we may expect this mine to be developed and put into operation as rapidly as reasonable possible.Manganese. - At Jacksonville near Woodstock surface exploration followed by drilling has outlined a reported 150,000,000 tons of iron-manganese ore. A great deal of metallurgical research has been performed on this material. Exploration for base metals continued on a broad scale throughout many parts of the province. This work consisted of routine prospecting, trenching, diamond drilling and geochemical and geophysical surveys. It is of interest that much geophysical work was done from the air using conventional aircraft and helicopters. During the year, 18,725 mining claims were staked. These added to the claims from the previous year gave a total of some 40,000 claims in effect as of the first of 1955. As a matter of comparison, it may be noted that 593 claims were in effect in 1950. For the last five months of 1954, the average number of claims recorded per month was 2,023. The sudden increase of work involved in recording and processing these claims has made necessary the expansion of the office staff of the mines branch of the Department of Lands and Mines. Two visual records systems have been set up which makes it possible to find the records respecting any of the 40,000 claims in two or three minutes. This has been a great assistance to those requesting information concerning claims and has been done in one recording office with a small staff. It may be of interest to note that the province of Ontario operates 13 recording offices and the total number of claims handled in January was 3,421. Plan Amended. - In anticipation of the development of the mining industry, the plan of organization of the mines branch has been amended to provide for a Mineral Lands Division, a Mine Inspection and Engineering Division, a Geological Division, a Mine Assessment and a Bathurst Office. This organization is considered adequate to cope with the situation for the time being and the creation of a Department of Mines is not considered justified at the present time. Not all of these positions have been filled but in November, Mr. [illegible] Currie was named Chief of the Mine Inspection and Engineering Division. Mr. Currie is a former Maritimer and a graduate mining engineer. In this capacity he has worked 12 years in metal mines, two years with the Nova Scotia Department of Mines and for the past three years has been resident engineer and inspector with the British Columbia Department of Mines. New Code. - He has drafted a code of regulations governing the operation of mines and safety precautions and comments are being invited from those in charge of such operations. This code when completed will be submitted to the Lieutenant Governor in Council for approval. It should be noted that the Mines Branch has moved its offices from the Forestry and Geology Building at the University of New Brunswick and is now housed in the former Dominion Entomological Building next to the Bonar Law Bennett Library on the university campus. It is my opinion that we are most fortunate to be able to co-ordinate the efforts of mining exploration and forest industries under one authority, and most particularly with the thoroughly competent and experienced guidance of our present deputy minister, Mr. W.W. McCormack."

IDX_Names: Woodstock Fe; Quaco Manganese; Markhamville Manganese; Lake George Antimony; Sandstone, Building Stone, Monument Stone, etc.; Granite; Gypsum; Albert / Kings County Oil Shales; Grand Lake Coal; Albert Mines; Geology - General;

Daily Telegraph - Jun. 30, 1876 Our Woods and Minerals at the Centennial. - The minerals of New Brunswick, which are treated in the second part of Messrs. Bailey and Jack's pamphlet, consist of iron, copper, manganese, antimony, gypsum, bituminous coal, bituminous shale, albertite, building stones and sandstones. Deposits of bog iron ore are found in several parts of New Brunswick, the best beds being above the rocks of the coal measures in Queen's, Sunbury and York. These measures sometimes cover considerable areas attaining a thickness of 4 or 5 feet, but no attempt has as yet been made to remove or smelt them. An analysis of some ore found in Sunbury yielded 47 per cent of metal. Of the red hematite of this Province, our authors say:-The iron ores of Woodstock were first discovered by the geological survey of the State of Maine, under Charles T. Jackson, as early as the year 1836, having been traced by him from the Aroostook region in the State above named northeastward to the St. John River, and more recently to the eastward of the latter in several bands for a distance of fifteen or twenty miles, or over a large part of the northern and northeastern portions of the County of Carleton. The principal locality from which the ore has been removed is in Jacksontown, about three and a half miles from Woodstock, and about two miles from the west bank of the St. John river. As seen at this point, the ore beds (portions of which are a true hematite, while others are a hydrous peroxide or limonite) are somewhat irregularly interstratified with a of clay slate, usually bright red or brownish red in the immediate proximity to the ore, but elsewhere of a pale grey color, and highly inclined. The width is from six inches to eight feet, the average thickness being about three and a half feet ....?.... their ....?.... variable. About 40,000 tons are said to have been smelted at the Woodstock works while in operation, the resulting metal being remarkable for its great hardness and strength, and admirably adapted for the manufacture of steel. It contains a considerable percentage of manganese. Copper ores exist in considerable quantities, the best being found in the rocks of the southern coast of the Province. The attempts so far made to work these ores have as yet met with but small success, although aspecimen from Salmon River is said to have yielded 62 per cent. of copper. It is to be hoped that the copper beds f this Province will eventually become profitable. With regard to the manganese beds found in this Province, our authors say:- Deposits of black oxide of Manganese consistingchiefly of pyrolusite but associated with more or less ofmanganite, are not of uncommon occurrence in connection with the rocks of the Lower Carboniferous formation, and have been mined to a greater or less extent at several points, such as Markhamville, Quaco and Shepody Mountain. At each of these localities the mineral is met with in connection with limestones lying at or near the base of the series, being distributed through the latter partly in the form of veins but chiefly in irregular masses or Pockets, some of which are of remarkable purity. The most important deposits which are being at present worked are those of Markhamville, under the direction of the Victoria Manganese Company. These were first opened in 1863, since which time the whole amount of ore removed has been about 6000 tons, the annual production varying from 500 to 1500 tons. Owing to the distance of the mines from railway transport, eleven miles, the ore is subject to a cartage of $3 per ton; but notwithstanding this drawback is profitably worked, the price at Sussex varying according to the quality, from $15 to $50 per ton. Manganese is also met with to a limited extent in rocks more ancient than those of a Lower Carboniferous age, near Bathurst, and in those of the Huronian system in King's County, and it is probably from these in part that the ores above described have been derived as secondary products. Another important metal is antimony, which is found at Prince William, and here again we cannot do better than to quote from the pamphlet:The occurrence of Stibnite, or Grey Sulphuret of Antimony, at Prince William, seems to have been known for a number of years, but attracted little attention until about the year 1862, when fresh discoveries indicated a considerable body of ore having been made, several companies were formed with a view to its development. Through the explorations of the latter the mineral was found to be more or less abundantly spread over an area of several square miles occurring chiefly in white quartz veins or veins of quartz and spar, intersecting hard clay slates and sandstones of undetermined age. These veins vary in thickness from a few inches to six feet, the ore being irregularly distributed through the quartz in strings or veinlets, sometimes attaining a thickness of twelve to fifteen inches. A large portion of the ore hitherto raised has been obtained within a short distance of the surface by means of trenches dug on the course of the lodes, but several shafts have also been sunk, attaining the depth of one hundred feet or more. In connection with these on the property of the Lake George Mining Company, somewhat extensive works have been erected, embracing an 80 horse-power engine, a 30 horsepower air compressor engine, a Burleigh steam drill, Blake's crusher, rollers, jiggers, etc., as well as furnaces for desulphurization and smelting. From these, when in full operation, 15 tons of metal were obtained about every six weeks; the charges (of 500 cwt.) yielding from 45 to 56 per cent. of reguins. The fluxes employed are charcoal, soda or salt cake and rosin. The value of the metal on the ground is 12 to 14 cents per pound. It is partly exported in cakes or ingots to the United States, being valued in Boston at $12.25 to $12.75, gold, per ton, and partly employed on the ground in the manufacture of Babbit metal (containing 15 to 20 per cent. of antimony with lead and tin, or in the better qualities with lead, copper and tin), valued at from 20 to 50 cents per pound.Gypsum or plaster is found in great abundance in this Province, as it is also in Nova Scotia. The largest deposits at present known are at Hillsboro', in Albert County, where the total head of rock is from 90 to 100 feet, about 70 of which is composed of soft plaster or true gypsum, which rests on beds of hard plaster of unknown depth. At Hillsboro', during the season of 1875, 129,000 tons of plaster were quarried, 5,500 tons of which were shipped in rock and 47,200 barrels ground and calcined. The uses of plaster are too well known to require any mention. The value of the deposits of plaster in this Province must increase year by year. Our authors do not give a very encouraging view of the coal mining prospects of this Province, and we quote their remarks in full: More than a third of the Province of NewBrunswick is occupied by rocks of the coal formation, which present the usual variety of conglomerates, sandstones and shales, met with in other coal regions, together with numerous and characteristic fossil remains. Seams of coal are also met with at various points, but so far as at present known, are all of inconsiderable thickness, only one, that of Grand Lake, attaining a thickness (22-26) sufficiently great to be capable of working. Being, however, usually nearly or quite horizontal, such beds as do occur cover considerable areas, and when sufficiently near the surface are readily removed. For the same reason but little information can be obtained from the surface as to the possible occurrence of thicker beds beneath, and it is necessary to resort to borings in order to prove the latter. The results so far obtained in this direction are certainly unfavorable to the existence of any such beds, or even to the probability of any great thickness to the coal formation as a whole in this region, but the latter being unconformable to the older beds upon which it rests, and these being highly disturbed, forming troughs and ridges beneath the carboniferous rocks, it is impossible that the latter may really at some point attain a much more considerable thickness and include workable beds of coal. The only locality in which mining operations for this mineral are at present conducted is in and about the Newcastle River and the shores of the Grand Lake, in Queen's county. The beds here having a thickness of about two feet, are usually met with within ten or fifteen feet of the surface, and have been removed at a great number of points over an area of over one hundred square miles, indicating a total productive capacity of about 154,948,147 tons. The coal is a true bituminous coal of the caking variety, and is employed both for household and blacksmith's use. The total annual production is at present about 3,000 chaldrons, which, delivered in the city of St. John, is sold, according to quality, from $4.50 to $8.00 per chaldron.Bituminous shales are found in considerable quantities in Albert County, and at one time an attempt was made to employ them largely in the manufacture of il, as much as 63 gallons to a ton being obtained, but this oil was unable to compete with the cheaper article from the wells. The same shales yield 7300 feet of gas per ton, and in 1865 some 2000 tons of shale was sent to the United States to be made into gas. With regard to Albertite, which is amongst the most remarkable of mineral products, our authors say:-This remarkable mineral, occurring in connection with the calcareo-bituminous shales or pyroschists above described, was first discovered by accident about the year 1850, and has been by some regarded as a true coal, by others as a variety of jet, and by others again as more nearly related to asphaltum. It resembles the latter closely in appearance, being very black, brittle and lustrous, with a broad conchoidal fracture, and like asphaltum is destitute of structure, but differs in fusibility and in its relation to various solvents. From the true coals it differs in being of one quality throughout, in containing no traces of vegetable tissues, and in its mode of occurrence, which is that of a vein and not that of a true bed. This vein occupies an irregular and nearly vertical fissure, has a varying thickness of from one inch to seventeen feet, and has been mined to a depth of 1,162 feet. The accompanying shales are in some portions abundantly filled with the remains of fossil fishes, (Paleoniscus) and it is not improbable that it was from these, in part at least, that the mineral was derived, existing perhaps at first in a fluid condition (in which state it has in some instances become the cementing material of conglomerate), and subsequently hardened into its present form. Vegetable remains are almost entirely wanting. Between 1863 and 1864, inclusive, 154,800 tons of albertite were shipped. It is capable of yielding 100 gallons of crude oil of 14,500 feet of gas per ton, and when employed with other coals it leaves as a residuum a valuable coke. About 120 men are employed at the Albert Mines.Among building stones our authors make mention of granite and syenite which form extensive beds, particularly in the county of Charlotte. Both yield good building materials, the red granite being capable of receiving a high polish, and it being possible to obtain blocks of it of any size up to 30 or 40 feet in length and 4 or 5 feet in thickness. The Bay of Fundy Red Granite Company vein gives employment to about 110 men.With regard to sandstones our authors say: This stone, commonly known in the United States as Nova Scotia stone, has been long known and highly prized, the Budreau Quarries having been first opened in the year 1856, since which time there has been shipped from that locality an annual amount of from 5,000 to 7,000 tons. The Caledonia Quarries were first opened in 1864, and now ship annually from 4,000 to 6,000 tons, while large quantities are also removed from the other localities mentioned above. The particular qualities for which these stones are prized are their colour, the facility with which they may be cut, dressed or ornamented, and their durability. The prevailing color in the Dorchester quarries is a yellowish or olive gray shading on the one hand ...?... a chocolate brown and on the other into a bluish grey, while at Mary's Point a portion of the rock is pale, purplish red,

N.B. Courier - Nov. 7, 1863 and Colonial Farmer - Nov. 16, 1863 Mining in Jacksontown. - Carleton County promises yet to rival Albert in its mining operations. Charlotte may perhaps come next, unless the owners of coal in King's and Queen's, and of the antimony mines in York, proceed to develop their hidden treasures. Gloucester may soon be favorably heard of. But for the American War, the copper mines at Bathurst, in which Mr. E. Allison, of this city is interested, would now be well opened up. We learn that messrs. J. & T. Johnston who are successfully carrying on copper mining in Charlotte, have purchased the interest of Mr. Stevens, of Woodstock, in the iron field found in Jacksontown; that they are excavating the ore, which is almost inexhaustible, and will immediately erect smelting furnaces on the spot. In this way they will save expense of transit of the raw ore to the point of export, as well as obtain charcoal at less expense. This firm is also proceeding with mining for copper on Adam's Island, which lies off Letete. During the week we have seen some fine specimens of the silver lead ore, found on Letang Island, the property of Mr. Fry. There is a general feeling that our mining laws require to be somewhat modified, and to be made more favorable to the mining operations in claims purchased from the Crown. - Col. Presbyterian"

S.J. Daily News - Oct. 14, 1864 Our Mineral Resources. - The development of the mineral resources of the Province is daily acquiring increased importance, not only in consequence of the gradual decline in the lumber trade which has so long been one of our most lucrative sources of profit, but because the attention of American and English capitalistsis being turned to our mineral lands to a greater degree than at any former period. This remark applies more particularly to the Americans, who are quietly securing the most valuable mining properties as yet opened out, and are anxious to extend their operations wherever a suitable and promising field for the investment of capital presents itself. The antimony mines of Prince William are in the hands of a Boston Company who will prosecute their development with energy and undoubted advantage. Parties from the same city are making careful enquiries respecting the range and probable extent of theiron bearing rocks of Woodstock with a view to share in the profits which those remarkable ores offer to enterprise and capital. Albert County itself bears witness to the singular advantages which the mining industry, properly directed, is capable of affording - its Albertite, Gypsum and building materials finding a greedy market in the United States, and the fortunate owners of the mining locations, well deserved profits for their investments. But we should like to see the people of the Province share, as they certainly ought to do, in the advantages presented by the mineral treasures of their own soil, and it was with much satisfaction that we noticed at the late exhibition at Fredericton a very marked increase in the representation of our mineral wealth. In describing the general features of the exhibition we glanced at the display exhibited by Professor Bailey, Mr. Matthew and Professor Hind, and we now propose to notice more at length the results of the explorations made during the past summer by the last named gentleman in the Northern part of the Province. Our readers are probably aware that Professor Hind has been engaged in ascertaining the probable area occupied by the already celebrated ""Quebec Group"" of Sir William Logan, the distinguished Canadian Geologist, which he discovered to exist on the Upsalquitch River in the county of Restigouche, in the early part of the summer. The ""Quebec Group"" is now known to be the great metalliferous formation of America, and it has long been recognized as such under different names, but without a suspicion of their relation to one another, by the American and Canadian Geologists. It was in 1860 that Sir William Logan first ascertained the true connection of the different metal bearing rocks of Canada and the United States, and because he satisfied himself that they constituted but one great metalliferous group and that this group was enormously developed in Lower Canada, and particularly near Quebec, he named it the ""Quebec Group,"" and as such it will very probably be recognized by the geologists of all the different States of the Union in which it is known to occur. As already stated, Professor Hind discovered in the early part of this summer that the ""Quebec Group"" comes to the surface on the Upsalquitch and the Nepisiguit Rivers, having there a breadth of about forty miles. He has subsequently ascertained that this important group stretches through the Province, and enters the State of Maine south of Woodstock, and extends a few miles north of that town - forming a belt across the Province not less than 30 miles broad. His collection of rock specimens with their associated minerals, at the late Exhibition, was chiefly from this group as it occurs in New Brunswick; and they were obtained from four lines of exploration which he has made across it. Among the minerals exhibited with the mother rock were copper bearing diorites, black magnesian slates which are supposed to be one seat of the gold not only of New Brunswick but of Nova Scotia and Canada. There were exhibited also what are called the ""Glauconite Slates"", an important member of the ""Quebec Group"", together with red slates and their associated iron ores, purple manganese slates, porphyries red and green, and gold obtained from the drift gravels and sands of the Nipisiguit, Upsalquitch, Tobique, Campbell river, Serpentine, &c. It results from a study of the mineral collection exhibited by Professor Hind that some idea can be obtained not only of the mineral resources of the localities which have been the scene of his operations, but also of the direction in which practical miners should expend their energies. It will be apparent to every one that the ores of metals exhibited by themselves, without relation to their geological range or distribution, cannot convey to a stranger, or to scientific men who may be consulted by capitalists, an adequate idea of the mineral wealth of a parish, county, or Province, because such ores may represent the richest portion of a mineral vein which would soon become exhausted if vigorously worked, as, unhappily, the dear bought experience of many in this Province is able to prove; but when metalliferous rocks extending over a hundred miles or more in one continuous belt are discovered and properly described, we feel satisfied that it requires time only to reveal the mineral treasures which experience and science assures us they contain. The map which illustrated the geology of the carboniferous area in the valley of the Tobique points out to any and every enquirer the place where to find his sandstones, his grits for millstones, his limestones, his gypsums, his firestones, housestones, argillites, &c., and a map of the ""Quebec Group"" of New Brunswick would point out the copper bearing rocks, the manganese and iron series, the lead and antimony series, and we hope in due time the rock in which the eager prospector may find his gold. We shall look for Professor Hind's report with much interest, and are glad to learn from himself that he intends to spend the remaining portion of the season in examining the geology of Albert, King's, Queen's, Charlotte and St. John Counties. We must not omit to notice the beautiful sea green and red argillites, the dolomitic limestone and the fine blue slates of the Upper Silurian rocks which lie to the North of the ""Quebec Group"" in this Province. Although they have not exhibited much metalliferous wealth, yet they are rich in valuable materials for construction and decorative purposes."

Miramichi Gleaner - Oct. 15, 1864 Provincial Exhibition. - We are indebted to the St. John Globe and Telegraph, for full particulars of the Provincial exhibition which was brought to a close on Saturday last… The display of the richness of our rocks and the deposits in the bowels of the earth, must ultimately prove of great service to our people. ... Minerals. - The Mineral Resources of the Province are well represented. Some very fine specimens of antimony are shown by the New Brunswick Antimony Company, and masses of Pig Iron with the ores yielding the metal are sent by Mr. Best, of the Woodstock Iron Company. Albertite, from the mines in Albert County, and coal from Grand Lake, are displayed in fine masses. Our townsman, Mr. Matthew, exhibited his beautiful collection of New Brunswick minerals, which has cost him many year's labour, and Professor Bailey's Cabinet attracts general and well deserved attention. Professor Hind displayed a large assortment of specimens of Minerals in the matrix or mother rock, and arranged in geological order. The plan adopted by Professor Hind is worthy of special notice, as it exhibited not only the mineral itself, but the rock in which it is found and its geological relation to the rocks. His explorations during the past summer was confined to the country northwest of a line between Fredericton and Bathurst, and consequently, only about one half of the province is represented by the collection exhibited. The carboniferous area in the valley of the Tobique, 26 miles broad, illustrated by a geological map, showing the relation of the gypsum series, the limestone and sandstone series in that valley, with specimens ofhonestones, millstone grits, sandstones for grindstonesand building purposes, ochres, refractory materials, polishing powder, &c. which abound in the Tobique country. Four sections stretching across the country, occupied in part by the great metalliferous belt of North America, called the ""Quebec Group"", are represented in detail. The most interesting rock specimens from these sections, which averaged forty miles in breadth, are Drift Gold, from no less than eight different localities, viz., the Nepisiguit, the Portage River, the Upsalquitch, the Little Southwest Miramichi, Campbell River, Serpentine River, and two from tributaries to the Tobique. I noticed also the copper-bearing Diorites of Campbell River and the Tobique; the Iron ores from Woodstock, the Becaguimec and Southwest Miramichi with their associated Red Slates and Limestones; the Porphyries of the Serpentine, the right hand branch of the Tobique and the Nepisiguit, some of them copper bearing. The beautiful red and green conglomerates from the Blue Mountain Range on the Tobique, were shown as materials suitable for ornamental and constructive purposes; the Jasper series of Campbell River and the red and sea-green argillites from near the mouth of the Tobique, were exhibited with the same object. The traps and fossiliferous limestones from Cap Bon Ami, near Dalhousie, with their associated honestones, also found a place in this collection, together with moulding sands from the St. John and Yellow Dolomites or Magnesian Limestones, galena from the Tobique and copper ores from the St. John. - The collection exhibited by Professor Hind derives value from its scientific arrangement. A study of the different sections showed where each species of rock with its characteristic mineral might be found throughout the country explored. An Upper Silurian Dolomite, for example, holding the chain coral in profusion, was shown to mark the limit northwards of the ""Quebec Group"" on the Upsalquitch and on the Tobique; the same rock probably stretching continuously from one point to the other; so also with the Red Slates, with which the Woodstock iron ores are associated; these were represented in the different sections, as appearing on the Southwest Miramichi, a few miles above

Boiestown; on the Becaguimec and on the Upsalquitch and Nepisiguit, thus showing the extensive range of this important rock with its iron ores. The copper-bearing Diorites were also represented in three of the sections, and the purpic slates with their associated manganese ores were shown to stretch from the Tattigouche to the Upsalquitch and beyond. The advantages of a scientific arrangement in illustrating the mineral resources of the Province can not be over-estimated, for, however numerous and beautiful isolated mineral specimens may be, they do not afford the miner or capitalist the requisite information respecting their distribution and probable commercial value. The following is from the Telegraph, Oct. 10, Fredericton, Oct. 8. - ... Minerals. - For the best collection of New Brunswick minerals the first prize has been awarded to Professor Bailey whose cabinet is much admired by all, the specimens being so classified, arranged and labelled that even the unscientific observer may understand them. The Professor in his late tour through the Counties of King's, Queen's and Albert, has added a large number of new specimens to his collection, and his Cabinet embraces specimens from almost every locality in the Province. I noticed Iron Ores from Carleton, St. John, Charlotte, Victoria, Queen's and Gloucester; and lead ore, from nine different localities.There are specimens of Gold, too, but of course no discoveries have yet been made in sufficient quantities to be of any service ... To attempt a mere enumeration of the different mineral specimens would be a hopeless task, and indeed it is a matter of surprise to persons less enthusiastic than the Professor, that during his comparatively short residence in the Province has made so perfect a collection of its native minerals. Professor Bailey has taken the first prize for useful minerals of New Brunswick. The second premium for New Brunswick Minerals has been awarded to Mr. G.P. Matthew, whose collection is highly creditable. Mr. Matthews has taken a prize also for Combustible Minerals of N.B., the only collection exhibited."

Carleton Sentinel Dec. 3, 1853 As we promised last week, and for the information of those of our readers who have not seen them we now proceed to give a short sketch of the Iron Works, &c., at the Upper Town and the operations there carried on. TheIron Ore is brought a distance of three miles from theirinexhaustible mines in Jacksontown, and laid on a layer of wood placed on skids to admit air underneath and piled alternately with layers of wood and charcoal to a height of 6 or 7 feet in long piles, about 20 feet wide, here it is roasted or calcined until it becomes easily broken into suitable sizes for the Blast Furnace. Charcoal is made in 6 large kilns, holding from 40 to 50 cords each, 3 taking about 8 to 10 days from the time of packing in the wood, to taking out the charcoal, which, when made, is taken to large Storehouses for use. On the yard we also saw some of the new Iron Ore, lately discovered in immense quantity about 300 yards from the Furnace - this ore a Clay Iron Stone, we were informed, when mixed in certain proportions with the other, produced an Iron superior to any ever manufactured here. There were piles of a new limestone from the Sheriff's Hill, only about 600 yards from the Furnace, lately found - the nearness of this last effecting a great saving of transport, the Company having formerly to go 10 miles for Limestone. We next visited the Tunnel-head, where the furnace is filled or charged with the Charcoal, Ores, and Limestone, the Furnace is 35 feet high and 10 feet wide at its greatest width. The Engine house

contains 3 Steam Engines for the Blast Furnace, of which only one was working, being sufficient to drive two large Iron Blowing Cylinders, which acting like immense Bellows were continually forcing air into a large Receiver, from whence it is conducted through pipes to the bottom of the Furnace, and there blown in through 3 Tuyeres, set close to the fusing mass of materials and having water continually passing through them to prevent their melting. Steam is raised in the Engine-house by the Gas or waste heat from the Furnace, being conducted under and returned through the Boilers - the same heat taken from the Furnace in another direction, when requisite, heats the air passing through the heating ovens, thus giving Steam and Hot-blast without any extra expense, and effecting a very great saving of fuel. - There was a third Engine supplied with steam, from the same Boilers, and used to set in motion a Circular Saw, and a large hammer for Blooms from a Puddling Furnace adjoining. On our way to the Casting-house, we were shown a Lime-kiln, Mortar-mill, Blacksmith's shop and Brick-yard, all very convenient for the Company's operations, and on their own premises. In the Casting-house we observed a man moulding Pig patterns to run the liquid Iron into - another was wheeling out the Cinders as they cooled. Being near Casting time we walked about, saw large heaps of the Cinders or Slag extending in the River, on the bank of which, the Pig Iron is piled in 3 ton heaps ready for shipping - the landing is one of the best on the river and accessible at all times during the navigation season. Close by the Casting-house is the line laid down in the preliminary survey of the St. Andrews and Quebec Railway, which, when completed will put these works in communication with the seaboard during the shutting up of the river navigation. It is now time to cast, or draw off the Iron melted during the previous 12 hours, and on returning we found men busily engaged tapping the Furnace, below where the melting Cinder was lava-like flowing over. The liquid Iron flowed along a Gutter in the sand, and soon filled one of the Beds of moulds or Pigs we saw making, it was then directed into another, and continued running until a third was filled, being, as we were informed, over three tons - this is done twice in 24 hours. As the Iron was near done running a large flow of Cinder came rushing out and was led over one side of the Gutter where it soon formed a small pool of liquid fire. We now wended our way homeward and in passing, must not omit mentioning the Company's Store and Boarding house, between which the road already partly graded runs to the mines at Jacksontown, - here the Railway is to be placed for the transport of the Ores and Limestone which lie in one continuous route. As we stated in our last the result of the present experiments has proved highly satisfactory, Iron can be produced of excellent quality and abundant quantity, and the Company are so far encouraged as to meditate an enlargement of their Capital Stock which the Act of Incorporation empowers, with a view to operations on an extended scale and the manufacture of the Iron into Bars. We wish them that success which their enterprise well deserves, and with which we think the destinies of this flourishing County particularly interwoven. No need of going to California or Australia if the mineral wealth of our County be only properly developed. Carleton possesses a Steel-making Iron Ore in quantity sufficient to render Great Britain independent of Sweden or Russia for generations, and which only requires an outlay of some of the superabundant capital of Britain to make it as well known in London and Sheffield as the best works of those Countries. We repeat, our County is rich in Mineral wealth.We have seen a very rich specimen of lignite, the outcropping of Coal found not over 3 miles from where we write, which, ignited well and burnt away leaving but very little residue. We have also been shown Silver-leadfluxed and melted from Ore found in this our County. These sources of Mineral wealth and our high Agricultural Capabilities warrant the inference that Carleton is soon to be destined to take rank as one of the richest Counties in the Province of New Brunswick."

Gazette - Aug. 30, 1899 Our Mineral Resources. - The government of New Brunswick has recently issued in pamphlet form the report of Prof. Bailey prepared in the year 1897 and 1898 on the mineral resources of New Brunswick. Prof. Bailey was a member of the staff of the geological survey of Canada and made this report originally for the federal government. In order that the province might possess a comprehensive report on the minerals of New Brunswick a number of copies were procured by Surveyor General Dunn for general distribution. The report is exhaustive and deals historically as well as otherwise with the mineral production of the province. The exploitation of the ironmines at Woodstock and the efforts to found blast furnaces at that locality are dealt with exhaustively.The manufacture of oil from albertite which at one time was a most important industry in Albert county and St. John are fully described. The search that has been made for gold, copper, silver, and lead are fully described and a whole chapter is devoted to manganese mining. It will be information to most people to know that fully half a million dollars worth of manganese has been mined and exported from New Brunswick. Prof. Bailey also goes extensively into the history of antimony mining and gives some valuable facts concerning the operation of the coal fields of the Province. The report is most interesting as it shows that while up to the present time there has been no great development of the mineral resources of New Brunswick, the province has yielded quite extensive quantities of coal, gypsum, manganese, albertite, iron, lime and building stone, and that there are immense stores of these materials hidden away under the surface of the province. Prof. Bailey does not draw a very rosy picture of the future for mining in this province, but at the best his report is based on a hurried survey of the province. It is however the most important evidence on the question since that of Dr. Gesner which is now almost forgotten."

Codes: 0275 / J8 / S5 / IDX_Names: Woodstock Fe; Albert Mines; Albert County Coal (some
St. Andrews Standard - Feb. 25, 1863 Minerals of New Brunswick - The North-eastern British Provinces of North America contain natural resources which, if properly developed and applied, would make them the greatest commercial and manufacturing commonwealths on the Atlantic seaboard. Thus coal and iron are the two grand minerals for manufacturing and for driving machinery, and those minerals are found in abundance, both in New Brunswick and Nova Scotia. At present we will only refer to New Brunswick, which has the elements of incalculable wealth stored up within its bosom. The carboniferous system of rocks covers an area equal to more than one third of the entire province. In Albert County, a rich carboniferous mineral -called by some coal, and by others asphalt - exists in great abundance. It surpasses all other minerals on our continent in the production of kerosene, and about 18,000 tons per annum have been mined during the past three years. A seam of rich cannel coal has also been found in the same country. Iron ore exists in considerable quantities nea rWoodstock, and smelting works on an extensive scale, were at one time in operation there, very fine iron being produced. - Gypsum, copper, lead, potter's clay, &c. are also found in large quantities."

Codes: 0275 / L1 / J8 / S5 / L4 / IDX_Names: Woodstock Fe; Saint John Graphite; Albert Mines; Albert County Coal (some Albertite); Westmorland County Oil Shales;
Carleton Sentinel - Oct. 22, 1850 MINING IN NEW BRUNSWICK. - By information received from the New Brunswick papers and from private letters, we learn that the Mineral resources of the sister Province are at last about to be developed. During the past six months more than twenty Mining leases have been granted by the Government, in the counties of Albert and Westmorland. Upwards of two thousand chauldrons ofBitumen, or Mineral Pitch, have already been raised at Hillsborough, and will soon be ready for shipment to the United States, to be employed in the manufacture of gas.Beds of excellent coal from two to six feet in thickness, have been pierced at Meranquin, and a party of English Miners have been engaged to commence the working. A Mr. Steadman has also opened a vein of coal in the neighborhood of Shediac, and is now exploring anasphaltum mine near the Petitcodiac River. Surveys we understand are made with great energy, and there is much competition among the purchasers of mining leases. It is stated that 100,000 tons of asphaltum might be shipped next season from one mine. At present the completion of a railway three miles in length, is required to

aid itstransport to the river. The Black Lead mine of St. John, has been well penetrated, and it is understood that the proprietors have made a profitable investment. The ironworks of Carleton County, which were unfortunately consumed by fire last season, have been rebuilt, and have commenced the manufacture of iron from the ore of Woodstock. These facts are encouraging to the inhabitants of New Brunswick, and fully confirm the predictions formerly made by Dr. Gesner in his geological reports published some ten years since. But in an equal degree they disprove the statements of Dr. Robb, and conflict with the statements put forth by him in Professor Johnston's recent Agricultural report. The mineral resources of this fine Province are evidently under-rated. The opening of the above mines has aroused a new energy, and all no doubt contribute largely to the prosperity of that Province, where all the mines and minerals are under the control of the Legislature, and open to the competition of its inhabitants. - HALIFAX COLONIST."

N.B. Courier - Sep. 27, 1851 We have been favored by the Directors of the Mechanics' Institute with the following Report, which we have much pleasure in publishing: Report on the Industrial Exhibition, Held at Saint John, On September 9th, (and following days,) 1851. To the New Brunswick Society for the Encouragement od Agriculture, Home Manufactures and Commerce throughout the Province. On the 11th of June last, W.J. Ritchie, M.P.P., the President of the St. John Mechanics Institute made application to the New Brunswick ... Class 1. Raw Materials: Sec. A. Minerals. The Exhibition was by no means complete in this department, although the Museum of the Institute, which was thrown open to the public, contains a great variety of the useful Minerals of the Province. We could wish to have seen at a glance, a series of the Provincial Rocks and Minerals of economic importance, and shall expect it at some future Exhibition. The Minerals exhibited on the present occasion were, many of them, of considerable interest. We may mention - A mass of native Black Lead, of which a large and valuable vein exists near Indian Town, and is now profitably mined by a Joint Stock Company. Samples of prepared Black Lead, exhibited by the St. John Black Lead Mining Company: this article seems well adapted to supply all the wants of our Provincial housekeepers. Asphatum or Asphaltic Coal, (for there is adoubt as to its true nature,) is a valuable Mineral, mined by a private Company in the Parish of Hillsborough, Albert County, and is already largely in demand for the manufacture of Gas. Soft bitumen, or Naptha, from the Petitcodiac, where it issues from the earth in a liquid form, and afterwards hardens by exposure to air. Asphaltic Shale, from Albert and Westmorland Counties; this is an article, the use of which in making gas, waterproof cements, pavements, &c., is increasing every day. Mineral Paint (an earthy oxide of iron, orferruginous earth,) from Shediac; this substance occurs in various parts of the Province, and is yet destined to replace all the forms of ordinary paint as a covering for wood work, &c. exposed to risks by fire. This present sample was exhibited by the Messrs. Gilbert. Mineral Paint, (an earthy oxide of Manganese,) from Albert County; an article which may yet be brought into use. Black lead, we may observe, is considered to be a good kind of mineral, or fire-proof paint; and we would suggest to the St. John Black Lead Company, that they should make some experiments upon the subject. Alabaster, or White translucent Gypsum; this is another of the varied Mineral products of Albert County; we observe specimens of it now for the first time on public exhibition, with great satisfaction; there is a square block of it, a vase turned from it, by Mr. McCoach, and a head carved in alto-relievo, on the same material, by Mr. Foulis. Its admirable purity and general qualities are well seen in these specimens, but none of them exhibit the beautiful polish of which it is susceptible. There is also a magnificent group of Chrystals of Gypsum, from Kings County, but their economic value is small as compared with the massive form from Hillsborough. Lime. - There is a cask of beautiful white Limeexhibited. This is one of our staple productions, and the St. John Lime is unsurpassed for its purity and general fitness for the purposes of the builder. The Limestone contains less than two per cent. Of impurities.Salt, by Joe Brand, of Sussex Vale; this salt is of first rate quality for farmers' purposes, and we are much pleased to learn that its manufacture has been resumed at the springs, and that Mr. Brand is enabled to sell it as low as the imported salt.Honestones, from the Kennebeckasis; these seem to be of good quality, and work either with water or oil. They bite well, and will compete with the Honestones of Woodstock or Miramichi, which are now coming into repute. Lead Ore. - Of this there are samples from King'sand Charlotte Counties, and Iron Ore from one or two places; but no information is given as to the probable supply from the various localities. The samples of Iron and Steel, from Woodstock,seem to be of the very first quality; the Iron has been bent and twisted, when cold, in every direction, but without showing the least injury to the fibre. It would be hard to devise a more complete proof of the quality of the article. We understand that the manufacture of Woodstock Iron will now be carried on vigorously by a Sheffield firm, who have become aware of its admirable qualities and adaptation for the making of Steel. Pipe Clay. - This article is from Albert County, and is exhibited by Mr. Foulis. It has a very good color, and seems to be well adapted for the manufacture of Stoneware, &c. ..."

Codes: 0275 / X1 / IDX_Names: Woodstock Fe; Grand Lake Coal;

Carleton Sentinel - Sep. 19, 1868 and S.J. Daily News - Sep. 29, 1868 OUR MINERAL RESOURCES. - Norris Best, Manager of the Woodstock Iron Works, has written a letter to the Sentinel in reference to our mineral productions. As any development of the resources of our country is a matter of interest to the whole people we quote a portion of the letter:- ""I am afraid the Government of this Province (nor yet of the Dominion) have never fairly entertained the immense advantage the mines and minerals (especially coal and iron) may be and are to the Country in which they are known and found to exist in this Province. It is probably not generally known that a very great part of the area of this Province is underlaid by that most valuable of all treasures, coal; that these measures, somewhat triangular in shape, and extend from Bathurst on the North to Nova Scotia on the East, its apex being at the Oromocto Lake, and its North-western margin running from thence to Bathurst and approaching the Bay of Fundy on the Southeast; and yet with the certainty of this, it is, I think, almost as certain that only the South and South east sides of this great carboniferous basin have as yet been explored. What may be the result of the present explorations now being conducted under the superintendence of Sir William Logan, and the expense of the Dominion Government, it is of course impossible to tell. - The writer of this, however, took an opportunity of impressing the great value of the coal and clay-ironstone deposits of this Province upon the mind of the Hon. John Rose, the Finance Minister of the Dominion, who evinced the most lively interest in the subject, and promised to write Sir Wm. Logan personally thereon. One thing, however, is quite clear, that hither to our people have striven to a mass wealth, and allow the prosperity and progress of the Province to depend upon the getting and exporting of lumber, at best but an uncertain and speculative operation, rather than dig deeper for the more permanent and inexhaustible treasures of the earth. Could our Government realize the fact, that for (a comparatively speaking) small sum they could set at restthe (to some minds) vexed question of the existence of the clay iron-stone at the Grand Lake, the Valley of the Oromocto, and other places, they would confer a boon upon the Province and Dominion, the effect of which would be incalculable. When we look at the fact that we are importers of Pig Iron into this Province alone of probably 2,000 tons per annum, demanding a corresponding export of $40,000 in gold for the same, when we ourselves might be not only making our own iron, but exporters of it also, it is, I say, a most surprising matter that no continuous efforts have hitherto been made to obtain so desirable a result, this not having reference alone to the amount of labor and capital that would be employed and expended, but also to the royalty that would accrue to the Government for and from the working of the same."" Mr. Best promises at another time to show the resources of Carleton County for the production of Charcoal Pig Iron. We shall be glad to hear from Mr. B. on this subject. Information relative to the Iron and coal interests of New Brunswick cannot be too widely circulated. Mr. Best also expresses anxiety to have the interests of New Brunswick duly cared for in the negotiation of the Reciprocity Treaty, and alludes to the action taken in the Nova Scotia Legislature. This anxiety is quite natural. We fail to see, however, the value of following Nova Scotia's example by sending an independent deputation to watch proceedings at Washington. The Wilkins-Annand Government urged that course more from bad feelings towards the Dominion authorities than from a desire to guard the interest of Nova Scotians. A similar display of factiousness on our part is unnecessary. In the hands of the Dominion Government we feel confident our great maritime, fishing and mining affairs are perfectly safe. It is now just as much their interest as it is their duty to look after such matters, and we have no doubt they will be duly cared for in any negotiations with the Washington authorities."

Daily Evening Globe - Dec. 26, 1862 Mineral Localities of New Brunswick. - A Paper Read Before the Natural History Society of New Brunswick, At Its Last Meeting, By Mr. G.F. Matthew. - As no systematic list of the various mineral localities in the Province has heretofore been published, and the greater number still remain unknown to those who have not access to the few existing sources of information on the subject, I have endeavored to supply a want by collecting the numerous notes scattered through Gesner's report on the Geology of New Brunswick, adding thereto notices of localities discovered since his survey was brought to a close. In this work the writer has received valuable aid from his brother, as also from the late Dr.Robb and Mr. Wm. Payne of Portland. As the two branches of Natural Science, Geology and Mineralogy, are so intimately connected, it will be necessary, in order to obtain a comprehensive view of the character of the mineral deposits mentioned in the accompanying list, to give sketch of their geological distribution. The Province of New Brunswick is mostly occupied by unaltered rocks of aqueous origin. It is traversed, however, by three metamorphic bands which originate in a district of the same character, occupying the greater part of the County of Charlotte, and extending thence westwardly into the State of Maine. The northern land, pursuing a N.N.E. course through the Counties of York, Northumberland and Gloucester, terminates on the Bay of Chaleur. The 4 southern, of which the intermediate band passing through King's County is a subordinate spar, skirts the Bay of Fundy on its northern side as far as Chignecto Bay. A metamorphic district, of which little, however, is known, also exists about the head waters of the Tobique, Upsalquitch and Nepisiguit Rivers. The triangular area intervening between the two bands of altered and igneous rocks is occupied by an extensive coal formation, having deposits of Limestone and Gypsum, principally in the lower beds of the basin. On the triangular side of the first mentioned metamorphic band is another large and comparatively level district in which calcareous and argillaceous shales, of Silurian age, prevail. No great variety of minerals has been found in either of these flat districts, nor is it to be anticipated that there will be. Those, however, which do occur, are mostly of economic value (ores of iron, coal, gypsum, &c.) To the metamorphic bands and the district in which they unite therefore, we may look for the principal and more varied accessions to our mineral wealth. The following remarks regarding the southern metamorphic district are based upon the writer's own observations.The limestones of St. John Co. to which the localities in Portland pertain may have been produced by chemical deposition; for, although, they are only partially altered in many places, no fossils, except obscure vegetable remains have been detected in them. From the abundance of magnesian silicates we might suppose that these calcareous beds are, in part, ""dolomite."" The granite and gneiss of the limestone district contain tourmaline, epidote and laumontite, and small quantities of the sulphurets of iron, copper and lead, besides their ordinary constituents. Epidote is eminently characteristic of the trappean beds of Upper Devonian age, which extend in a double curve from Musquash to Bloomsbury Mt., and probably beyond. It is usually accompanied by quartz, specular iron and chlorite. Sheldon's Point is in this belt, and the minerals of Kingston and Clifton occur in stratified greenstone, probably of the same age; while those of Cape Spencer, West Beach and Black River are in overlying beds of sedimentary origin, largely charged with volcanic products. It will be seen that none of the zeolites found in the Triassic traps of Nova Scotia have yet been detected in the Devonian beds of volcanic origin on the North Shore of the Bay of Fundy; these latter seeming to hold (with the exception of chlorite and prehnite) anhydrous silicates only. The N.S. zeolites have been met with at only one locality in the Province - the Island of Grand Manan. It is not improbable, 5 therefore, that the trap of this island, like that of Isle au Haut and the North Shore of the Basin of Minas, is an outlier of the great masses which skirt the southern shore of the Bay of Fundy. Mineral Localities. - (This list was prepared three years ago for a supplement to Dana's Mineralogy which was not issued owing to the illness of the author of that work. I therefore feel that I am now at liberty to place it at your disposal. Alterations in the arrangement of some localities have been made, a few unimportant ones struck out, and others added. The marks used to distinguish the character of the specimens are similar to those in Dana's Mineralogy, viz: those which may be had in good specimens are underlined, (!) is added where they are remarkably good, (!!) where the specimens are unique. (NOTE - underlined articles are bracketed with square brackets, i.e. [coal] Albert County Grindstone Point and Island - Lignite, Iron Pyrites, Barytes. Hopewell - Gypsum, Selenite, [Alabaster].Albert Mines - Albertite !! Pollet River, 15 miles up - Coal. Shepody Mt. - Pyrolusite, [Calc spar], (rhombs with Manganese), Iron Pyrites, Native Alum, a clay. Turtle Creek - Coal. Carleton CountyWoodstock - Copper Pyrites, (mined) Wad, Bog Iron Ore. At Iron Mines - Hematite, Limonite. Charlotte County Beaver Harbour - Red jasper, Chlorite. Campobello island; at Welshpool - Iron Pyrites, Galena, Blende, Erubescite, Copper Pyrites. At head of Harbor de Lute - Galena, 4 in. vein. At Head Harbor - Iron Pyrites, Copperas. Deer Island, on N.W. side - Magnetic Iron, Calc Spar, (in Amygdaloidal) Hornstone, Quartz, (in trap). Digdeguash R., at Hog Island - Red jasper. On W. side of entrance - Calc Spar, (rhombs, in conglomerate,) Chalcedony, (in Greenstone,) At Rolling Dam - Graphite. Grand Manan Island, between Northern Head and Dark Harbour - Amethyst, Agate, Jasper, Hornstone, [Thompsonite, Stilbite, Heulandite, Calc Spar, Zeolite (Mesotype?), Apophyllite], Specular Iron, Magnetic Iron. At Whale Cove - Calc spar ! Heulandite ! Laumontite ! Stilbite ! Semiopal ! At Fish Head (2 miles S. of Eel Brook) - Chlorite, (abundant in qtz). At Ross's Island - Quartz Crystals. White Head - Chlorite, Quartz Crystals. At Kent's Island - Veined Marble. L'Etang Island and Harbour - Marble, Serpentine, Chlorite, Iron Pyrites. Le Tete - Galena, Erubescite, Copper Pyrites, Barytes. 6 Magaguadavic R., at entrance - Veins of copper pyrites, Malachite, Azurite. One eighth of a mile E. - Galena. Red Head, (on Mace's Bay) - Red jasper. Seeley's Cove, Hill 1/2 mile N. of - Quartz crystals, Calc spar, Magnetic Iron, Iron Pyrites. St. Stephen, 4 1/2 miles N. of - Graphite (in greywacke). Molybdenite, (in gneiss.) Milltown - Pyrites. Simpson's Island, on the Shore - Copper glance, Malachite. [See note]. Waweig R., 3 miles up, at Cormick's Mills, - Pyrites, Feldspar, Schorl and Garnet, (in boulder). At Bartlett's Pond - Quartz crystals. At Oak Bay - Hepatic Pyrites, in greywacke.) Gloucester County Bathurst - Malachite, (in coal). Eight miles from, on Tete-a-gouche R. - Manganite, (in crystals and crystalline,) [Copper Pyrites]. Kent County Buctouche R. - Coal. Cocaigne R., on branch, 3 miles from bridge - Coal. Richibucto R., 3 miles above Ford's Mills and at Big Brook - Coal. At Bass R. - Iron pyrites. Half mile W. of Liverpool - Bog Iron Ore. Kouchibouguaasis R. - Coal. Kings County Belleisle Bay, on N. Shore - Galena, (in limestone), veins of chalcedony, Jasper and Hornstone, (in trap). One and a half miles W. of Bull Moose Hill, on farms of Northrup and Benson - Large bed of Magnetic Iron. Clifton - [Orthoclase], (xls) Epidote, [(Pistacite)]. (common xls.) [Chlorite], (abundant granular,) Prehnite, all in bedded greenstone, Quartz crystals, Specular Iron. Hammond R., at Sherwood's - Graphite, (in limestone). Hampton, and at Darling's Lake, in loose pieces - Agate, Carnelian, Red jasper. Kingston, on ridge S. of village - Magnetic Iron, Magnetic Pyrites; also, Chlorite and Red jasper. Nerepis, near Hatfield's Mill - Iron Pyrites, (in greywacke). Near Mather's Inn - Amethyst, Quartz Crystals, Feldspar. Norton - Near Choat's Mill, on road to Belleisle - Argentif. Galena. One mile N. of Baxter's Inn - Specular Iron (xls) and Red Hematite. Quispamsis - Pyrites, Copper pyrites, Galena, Laumontite. Sussex, 1/4 mile from church, on McReady's farm - 7 [Selenite !] (hexagonal xls. forming in the mud of a spring.) [There are two fine groups of crystals from this locality in the Museum of the Mechanics' Institute.] Eight miles from Station, on Dutch Valley road - [Manganite], Pyrolusite, [Barytes.] Upham - Brine springs.Four miles E. of Titus Mill - Gypsum Northumberland County Boiestown - Coal. Barnaby's R., opposite mouth - Coal. Chatham - Coal, Iron Pyrites. Newcastle - Coal. Queens County Grand Lake, at Grand Point - Fossil Trees, containing Barytes, Pyrites, Copperas. Salmon River, (on Crawford's farm) - Coal, Caly, Iron Stone, Pyrites, Copperas. Newcastle - Coal mines. Coal Creek - Coal, (formerly mined.) Long Reach, opposite VanWart's - Chlorite. Washademoak River - Coal, (2 1/2 miles from Long's Creek.) Few miles above mouth on S.E. of a small cove - Hornstone, Jasper, Chalcedony, Carnelian, Quartz Crystals. Restigouche County Belledune Point - Verd Antique, Serpentine, Iceland Spar! Dalhousie, near to - [Agate], Carnelian. Point le Nim - Coal. St. John County Carleton, near Falls - Red Calcite. Chance Harbour - [Calc spar] (deep red xls) in quartz veins, Chlorite (in argill and talcose state). Brandy Brook - Quartz crystals. - Epidote (Pistacite) and Hornblende in boulders. Black R. settlement. - [Quartz crystals], Chlorite, Calc spar, Copper Pyrites, Specular Iron !(tabl. xls) Little Dipper Harbour, on W. side - Barytes, quartz crystals, Amethyst (in compact greenstone). Moosepath - Schorl (crystals), Hornblende (crystals), Felspar (red), Muscovite, Albite (?) Musquash, on E. side, Harb. at entrance - Graphite, Pyrites, Copperas. At Shannon's - Serpentine, Verd-Antique, [Chrysotile.] E. side of Musquash - [Quartz crystals] (veins in conglomerate). Portland, [Crow's Nest - Serpentine,] Chrysotile, Steatite, Magnesite, Asbestos. [Drury's Cove] - Indurated Talc, Pyrallolite (?), Graphite, Pyrites.[At the Falls] - Graphite (impure bed 4 ft.) [Fort Howe Hill] - Graphite, Calcite (several forms, viz: dogs-tooth spar, nail-head spar, &c.) [Howe's Road], 1 1/2 miles from St. John - Epidote (in syenite). ! 1/2 mile from road [Tremolite], Steatite, Mica (?). [Lily Lake] - Serpentine, Chrysotile, Talc, (radiated), Steatite, Graphite. [White Augite] (?). Quaco, Light House Pt. - Manganese, ([Pyrolusite]), (bed 4 ft). W. of Point - Lignite. E. of Quaco, Fuller's Creek - Graphite, Iron Pyrites. Farther Eastward - Schorl, Asbestos, Chrysotile, Serpentine. Sheldon's Pt. - [Epidote] (Pistacite and Zoisite), Actinolite, Asbestos, Calcite, Specular Iron, Malachite. Cape Spencer - Specular Iron (crystals), Calcite (crystals), Talc, Chlorite, Asbestos. Ten Mile Creek - Coal in slate and sandstone. West Beach - At Evan's - Quartz Crystals, Talc, Chlorite. Half Mile W. of Evan's - Vein of Magnesite with Talc, Chlorite and Magnetic Iron, Copper and Iron Pyrites, [Hematite], [Specular Iron]. [See note.] Point Wolf and Salmon R. - Iron and [Copper] [Pyrites], Asbestos, Chlorite, [Erubescite], Chrysocolla, [Cuprite.] Sunbury County Oromocto River, N. Branch, 10 miles up - Coal. Lincoln - Wad, Bog Iron Ore. Victoria County Tobique River - Red Jasper, Carnelian, Agate. At mouth, S. side - Galena. At mouth of Wapskehegan R. - Gypsum, Salt Springs. Three miles farther up - Stalactites (abundant). Quisibis River - [Blue Phosphate of Iron] (in clay). Westmorland County Bellevue - Iron Pyrites. Dorchester, Taylor's Farm - Cannel Coal, Clay Iron Stone. On Ayre's Farm - Petroleum, Asphaltum. Grand Anse - Gypsum, [Selenite] (large crystals), Apatite, (vide Gesner). Memramcook - Coal, [(Albertite).] Shediac - 4 miles up Scadouc R. - Coal. York County Harvey Settlement - Wad. Nashwaak River - Coal. Tay Creek - Coal. Pokiok River - Tin pyrites (in granite vein). Three miles from St. John River, in direction of Lake George - Stibnite ! [See note]. 9 In order to obtain a clearer view of the value of the mineralogical resources of the Province as thus far developed, let us take a glance at the more important facts to be deduced from the foregoing list. Many of the minerals noted in its columns are not of economic importance, and therefore will not receive any further notice. Serpentine and marble, both of which are largely used in ornamental work, are known to occur at many localities; but few of those which have been examined yield blocks sufficiently perfect to be useful to the manufacturer. Of such well known and widely distributed minerals as limestone and gypsum it is scarcely necessary to speak. Both, the former especially, are abundant in many parts of the Province. Heavy beds of limestone are common in the southern metamorphic belt, also on the Bay Chaleur. Unaltered deposits may be seen skirting the margin of the great coal field. Gypsum is confined mostly to the Lower Carboniferous series of King's, Albert, and Westmorland; but occurs also in the red sandstone district of the Tobique River. Chlorite or ""pipestone"" and Steatite or ""soapstone"" have been found at a number of places; but no deposit of the latter mineral, sufficiently large to be available for manufacturing purposes, has yet been discovered. Barytes, or ""heavy spar,"" has been met with only at a few localities, and not in any considerable quantity, unless we may except that in Sussex and a large deposit said to occur at Le Tete. This mineral is largely used in the manufacture of white paint, and also for other purposes. It resembles calcareous spar, but differs in cleavage and is much heavier. The only gem which this province has thus far yielded is that very common one called, according to its color, white stone or rock crystal, false topaz, and amethyst. Other varieties of this mineral, such as carnelian, agate and jasper, which are frequently used in jewellery, occur at several places. Garnet is reported from Waweig river, but it has not been found ""in situ"". All the tourmalines mentioned are of the ordinary black variety. It will be seen on examination of the catalogue, that all the metals in ordinary use as well as some others which are more infrequent, occur in this province. But of the commoner ones several have not been found in sufficient quantity to be worth extracting. Indications of tin were observed in the granite of the Pokiok river, by Dr. Gesner. Lead ore has been met with at Tobique River, Norton, Campo Bello, and other places, but not in sufficient quantities as to assure a profitable return to 10 the miner. Zinc blende is found at Campo Bello and a few other localities, but not even so abundantly as lead. This mineral is usually of a dark brown color, and is frequently associated, as at Campo Bello, with galena and copper pyrites. Several ores of copper, chiefly sulphurets and carbonates occur in various parts of the Province, but few of the mines opened in these deposits have been permanently worked. Those of Bathurst and Woodstock have been abandoned. But mining on a small scale is still continued at Salmon River and Le Tete, and experimental operations on the deposit at Simpson's Island have been commenced. Two ores of this metal have been newly added to the list of those already known to occur in the Province. These are the Suplhuret called copper glance, from Simpson's Island and cuprite, or the red oxide of copper found at Salmon River. Iron and manganese are the metals which above all others are most abundant. Heavy ore beds of the former are exposed at Woodstock, Nerepis Road, Bull Moose Hill, West Beach, and other localities referred to in the list. At the first mentioned place the ore has been worked for a number of years. Manganese occurs in greatest quantities and purity near the eastern terminations of the two metamorphic bands to which allusion has already been made. The earthy variety called Wad is also common. The mine near Bathurst which affords beautiful crystals of the grey oxide has been abandoned on account of the irregularity and unreliable character of the deposit. Operations, however, are still carried on at Sussex and Shepody. Of the precious metals, silver has been detected in some of the lead ores, in the ore of antimony near Pokiok, and in the copper ore of Simpson's Island, but only in minute quantities. Gold, so far as we are aware, is yet undiscovered; at least, there is no tangible evidence to show us that it has been found in the Province. If reliance may be placed on the results of the geological survey, the northern metamorphic band, the County of Charlotte, the region about the headquarters of the Tobique, and that part of the southern band which has not been shown to be of Devonian age, are the most promising districts for the gold seeker. The discovery of a rich gold field would undoubtedly give a great spur to the development of our Provincial resources, but, at the same time, would probably have a tendency to attract a lawless and reckless population. Seams of coal have been found at numerous localities within the great central area, covered by deposits of Carboniferous age. Few of these, however, promise to be productive. The unique variety found at Hillsborough has proved to be a mine of wealth to its owners. Operations have also been successfully carried on at the mines on Grand Lake for many years. But in no other part of the Province have beds of this mineral sufficiently large to attract the attention of capitalists, been opened. Those best qualified to judge (Drs. Robb and Dawson) of the productiveness of New Brunswick coal measures, gives us little reason to hope that they will yield stores of fossil fuel as large as, considering the extensive area which they cover, we might anticipate. Still the discovery of extensive beds is not altogether hopeless, for we should bear in mind that a great part of the area underlaid by these rocks remains unsettled and uncleared; and we may traverse parts of it for scores of miles through an unbroken wilderness. Although New Brunswick is not favored with the possession of mineral attractions so brilliant as some of her Colonial sisters, she is not altogether devoid of some solid advantages as the preceding summary will show. The many openings for the advantageous investment of capital, which are to be found in a young and flourishing colony is no doubt the reason why the abundant mineral wealth, with which bountiful Providence has endowed us, still remains undeveloped. As population increases, however, and our wants become more diversified, this source of a prosperous and remunerative commerce will receive the attention which it deserves. Already we see signs of the approach of such a period in the careful investigation which several newly discovered metallic deposits are receiving. [In these remarks I have endeavored as far as possible to occupy ground different from that taken up by Prof. L.W. Bailey in this valuable little publication on the mineral resources of the Province, as exemplified by the metallurgical collection of the University of New Brunswick; considering that a repetition of what has recently been made public would be superfluous.] Addenda. -Iron Ore of West Beach. - The bed of ore at this place inwhich the mine has been opened is included in the upper part of a large mass of coarse reddish-grey conglomerate, dipping to the S.E. at an angle of about 30ø, and distant a furlong from the shore. The pit or quarry from which the ore has been extracted has been opened in a bed of dark, reddish, brown hematite. One or more schooner loads have been taken away, and a quantity still remains awaiting shipment. The conglomerate is abundantly seamed with quartz containing scattered masses and veins of micaceous and specular iron in tabular crystals. Two or three miles eastward of the mine the iron ore again appears on the hill side. Here, however, three or four beds of ore (one of them 20 feet thick) are visible; and the associated rocks are different, consisting of beds of trap-ash, trap-ash slate, and talcomicaceous slate. The ore beds were not traced on the eastern side of Black River. Were it not for their variable thickness they might be sought for here with much probability of success. A continuation of the same rocks holds beds of limestone at Emerson's Creek, a few miles to the eastward. The facilities for working this ore are therefore, in some respects, unusually good, but no smelting operations have hitherto been undertaken. From its association it would appear that this ore was originally deposited in the state of a finely divided ferruginous mud, in a shallow sea and within the influence of active volcanoes. I hope to be able to show at some future time that the accompanying rocks do not possess the antiquity ascribed to them in the geological reports of Dr. Gesner, but are of a later date than the sandstones and shales of St. John, which have yielded such an abundant harvest of Devonian plants. [For the information regarding the two following localities, I am indebted to Edward Allison, Esq.] Copper Ore, Simpson's Island. -The vein of green carbonate (malachite) recently discovered, occurs in a small island, (not exceeding 100 acres in extent) about one mile south of Deer Island, andseven miles from Eastport. The island is composed of trap-rock, through which protrudes a band of slate, with nearly vertical layers, which extends across the island in an East and West direction; it being about four feet wide on the West side, and from ten to twelve feet wide where it terminates in a small cove on the East side of the Island. The copper lode occurs in this slate, and was discovered on the West side of the Island in a beach which extends (from high to low water) abut 400 feet. This beach is composed of rock covered with seaweed, except near high water mark, where it is shingle. The copper lode, where discovered, is about four feet wide, and about 150 feet from low water mark; it has been traced about 150 feet toward the shore and to low water mark. Several tons of this ore have been taken out and sent to Liverpool to be tested. A small sample sent some time since yielded 27 per cent of copper, and nearly four ounces of silver to the ton. The value of the ore as taken out is reported to be £27 stg. per ton. [Pieces of Copper glance (sulphuret of copper) were scattered through the Carbonate which forms the mass of the ore at the surface, and were found to increase when the evacuation was deepened. At a greater depth the ore probably consists of the former compound, as the carbonate seems to result entirely from decomposing agencies at work at and near the surface] - G.F.M. Antimony of York Co. -The vein of antimony recently discovered occurs in York Co., Parish of Prince William, about 20 miles above Fredericton, and is on the S.W. side of the river Saint John. The rise of the land from the river at this place is gradual, till the summit of the slope (about 300 feet high) is reached, when the ground falls away toward Lake George, and the Pokiok Stream. Near the top of the slope a band of primary rock, having a course about N.W. and S.E., protrudes through the soil, and is shown particularly where it crosses the highway. This band of rock contains the vein of antimony referred to. It was discovered in boulders evidently detached from this ridge, and upon uncovering the rock the antimony was discovered imbedded in it. The vein was traced about one quarter of a mile by trial pits, and probably extends further. It appears to be about two feet wide, with a dip to the North of about 45ø. The vein has not been penetrated to a depth of more than six feet. Samples of the ore have been analyzed by Drs. Hayes and Jackson of Boston - also by a person in Liverpool. The result differs

Codes: 0311 / 0604 / 0586 / 0608 / IDX_Names: Letete Mine; Simpson Mine; Magaguadavic River / Silver Island;

St. Croix Courier - Apr. 14, 1910 30 Years Ago. - Mining is about to assume a leading place among Charlotte county industries. It has long been known that this country is rich in minerals which only await the application of capital and enterprise to make them a most productive source of wealth. We are glad to know therefore that their development is no longer a matter of speculation but that operations are now in progress which will become still more active during the coming summer. Considerable activity has lately been manifested at Mascarene. Men are actively employed in the 'Revenue' mine at that place, controlled by St. John parties. An assay of the ore shows that it produces $132 of silver and four ounces of gold to the ton. Great activity prevails at the Dick and Williamson mine, and the sum of $7000 has been guaranteed towards putting up machinery at once. Former assays of the ore from this mine gave $77 in silver and $21 in gold. Within the last few days ore richer than any before found has been struck and the prospects of the mine are constantly increasing. The stock has been increased 100 per cent and holders have no disposition to sell. The Mascarene Mining Co., are also placing themselves in a position to start operations at once, a number of stockholders from St. Stephen and Calais having gone to St. George the other day with that object in view. The stock has recently advanced 50 per cent and no more is to be sold. As soon as spring opens work is to be commencedon Silver Island, near St. George, known as the Bradbury mine, now owned by parties in Boston. The Hartt mine, in the same vicinity, recently owned by Thieckens and McLean, embracing sixteen acres, has recently changed hands and arrangements are being made to work it. It covers part of the same lode as Silver Island, which is known to be so rich. It is stated also that a company will sbortlytake hold of the mines near Moore's Mills, and a gentleman has shown us a fine specimen of anthracite coalfound within a few mines of this town. If all these enterprises go forward this summer, as they promise to do, they will give considerable employment and add materially to the business of the county. Success to them all."

Morning Freeman - Mar. 20, 1880 Mining. - A correspondent of the Sun says. It is said, upon good authority, that the New York and Boston capitalists will commence boring again for oil on the Goodet farm, near St. Joseph's College, Memramcook. The indications give every promise of oil, and should these gentlemen fortunately strike it, immense benefits must result to this section of the country. There is a good barytes mine lying idle for want of capital in the Bonum Goold Settlement, about two miles from Memramcook Station, which if properly developed would pay good profit to any company working it, after a short time and reasonable outlay."

S.J. Daily Sun - Nov. 26, 1888 Mining Matters in New Brunswick. - A New Brunswick correspondent writes to the Halifax Critic: The Markhamville mines are still being worked in the interest of the trustees, and shipments of ore continue regularly. Negotiations are still pending on the Jordan Mountain or Stockton manganese mine. The exact nature of the negotiations are unknown, being enshrouded in a network of secrecy and rumor unfathomable, with hints of equity, law suits, etc. Work of exploration on a property above Waterfordis being quietly and systematically carried on. The principal promoters are from Bar Harbor, Maine, and evidently mean business. They are putting in a large engine and boiler to facilitate the work of development. About 40 or 50 feet have been tested in depth, and a large ore body is being exposed. The ore seems to be a galena, and rich in sulphuret, while, it is said, the quartz gangue carries considerable gold. We expect to hear of a bona fide working and paying mine in this locality before long. It was reported some negotiations had taken placefor the sale of the Freeze mine at New Ireland, in Albert County, but so far nothing definite has been made known. Prospecting for antimony, at or near Cromwell Hill, in the county of Queens, N.B., has been suspended for the present. The work of prospecting and developing on the Grand Lake coal fields is being vigorously prosecuted at present. The DeBertram syndicate have acquired rights on 30,000 acres of land, and testing is being made under the direction of Thomas Williamson, M.E. The prospects are good for the raising of large quantities of coal in this vicinity. A large deposit of magnetic iron ore of very goodquality so far as tested, with veins of valuable yellow sulphuret of copper on either side, is now in the hands of your correspondent for negotiation at reasonable figures. It is in the northern part of New Brunswick, and not far distant from I.C.R. railway and navigation."

Morning Freeman - Sep. 12, 1863 It has been ascertained beyond doubt that the antimony mines in Prince William must prove extremely remunerative. We are happy to think that some of the lessees are resident in New Brunswick. The English copper miners at Letete see reason to go on with their purchases and their operations. There is good reason to think that the Silver lead mines, on Fry's Island, will soon be tested. It remains to be seen whether New Brunswick capital can be got to flow into solid enterprise of this kind or whether, as in the case of the Albert Mines, sources of such vast wealth must be transferred to non-resident proprietors in New York or elsewhere. - Presbyterian."

S.J. Daily Sun - Oct. 7, 1880 Minerals No. 2. - Geological Sequence Collection of the N.H.S. - Passing around to the northern side of the table where the mineral exhibits are placed another upright case comes into view, containing a collection of New Brunswick minerals, the property of the Natural History Society. They are chiefly for the instruction of the student and geologist, and with this object are arranged in geological sequence; that is, the minerals of each of the rock formations which exist in the Province are grouped together and so arranged that they present to the eye the natural succession of the formations in time, the oldest, or Laurentian, which from its position is called the fundamental or formation gneiss in Scotland, being represented by a row of minerals on the lower shelf - minerals which have been found mostly in the neighborhood of St. John. On looking over them we observe that they are mostly minerals from the limestones of the Town of Portland, together with ornamental varieties of these limestones, and a few minerals and ores from the gneissic rocks. The second shelf contains the minerals of the Huronian, a formation which in other parts of America has proved to be rich in metalliferous deposits. One is not surprised, therefore, to see a preponderance of the ores of metals among the minerals on this shelf. There are here also specimens of the Indian pipe stone, and of barytes, a mineral used in the manufacture of paint. More than half of the minerals on this shelf are from the metalliferous belt of rocks extending from Mispeck to Upper Salmon River in Albert County. On the third shelf are shown minerals of Silurian formation. Here also there is a great preponderance of metallic ores, including iron, lead, antimony, manganese, copper and zinc. The ores of this formation are from various parts of the Province, including the coast of Charlotte County, York County and the neighborhood of Woodstock and Bathurst. The localities of antimony ore are in this formation, and it is the one in which gold has (so far) been found in this Province. The Devonian formation present but a meager display of minerals, rock crystal from Musquash and anthracite from Lepreaux being all that are shown from it. The next formation, however, abounds in handsome and valuable minerals. Such are the manganese ores, which, though occurring in the Silurian, are in far greater abundance and perfection in this. Agate, carnelian, and chalcedony, ornamental stones, are chiefly found in this formation (Lower Carboniferous) in New Brunswick. Gypsum, alabaster and albertite are also valuable minerals, and abundant in this formation. With the exception of coal the next formation(Coal Measures) does not show valuable minerals in any abundance except at Bathurst, where there is a considerable deposit of copper mixed with lignite or coal. This copper deposit is interesting as showing how organic matter (decaying plants, &c.) can seize upon metals in solution in water and produce ore bed; and it is also interesting as showing how the minerals of one formation may be derived from another, for the copper ore the Tetu-a-gouche (Bathurst) of the Silurian slates are considered to be the source of the copper in the coal measures near Bathurst. From the Triassic, which in New Brunswick is confined to the island of Grand Manan, only two minerals are shown, and they are of a kind quite abundant in the North Mountains of Nova Scotia. Lastly, on the top shelf are displayed the minerals which have been found in the recent deposits of New Brunswick, viz., the surfaces, clays, sand, etc. The ores shown in this group are due to chemical changes which have transferred them from older formations, as the Silurian and the coal measures to the surface bed. The most interesting mineral shown here is the selenite crystal of gypsum taken from a spring in Sussex, showing how the formation of mineral species in crystalline form is going on at present time. Altogether, this collection, though not very large, is sufficient to show the great range in time during which the minerals species of New Brunswick have been formed, and the preponderance of certain kinds (as the metallic ores) in some formations and scarcity in others. Other Collections of Minerals in The Exhibition. - This case contains also a small collection of combustible minerals of New Brunswick, which is complete, however, in that it contains specimens from all the districts where combustible minerals in quantity sufficient to be economically available for fuel has beenfound. The collection contains coal from Grand Lake, anthracite from Lepreaux, bituminous shale from the Caledonia works in Albert, and other minerals of less importance. On the table beside the case containing theexhibit of the Natural History Society stands a flat case with the ores and products of the Revenue Silver Mining Company, whose mine is situated on Letete Peninsula in Charlotte Co. They exhibit a quantity of specimens of galena and zinc blende, which, by the analyses of Prof. Jno. Burwash, are shown to contain both silver and gold in quantities from $16 to $22 per ton, the gold appearing mostly in the blende-ore. This company show in their case a sample of the ore ground to a fine powder, and in the same dish a button of silver, produced by the reducing process which the powder undergoes, as a sample of the actual product of the mine. Next the box of silver ores is a handsome show case in which Mr. Wm. F. Best exhibits a tastefully arranged collection of Useful Minerals of New Brunswick, comprising such as are used for fuel for the production of metals, and various processes in the arts. Among these may be mentioned coal from Grand Lake, Albert Coal, from Hillsboro, Red Granite, from St. George, atnimony ore and metal, Pottery clay, Iron ore from Woodstock, Manganese from Sussex, Graphite from Portland, and Lime from various localities, with Red Ochre, Lead ore, etc. On the opposite side of the table is a case containing samples of silver ore from Yarmouth, N.S., sent by Mr. F. Killam and others by Mr. R. Sentall, fromKing's County, N.B. There are also turned and polished balls of red granite from the workshop of Mr. O'Neill, at St. George. In this case also Mr. Markham has placed his Electric Batteries to show the means by which that powerful and useful explosive dynamite, or giant powder, is operated in the modern methods of mining. Near by, on the table, stands a box of copper conducting wire, so that all the necessary apparatus, except the fuse, caps and the dynamite are present. Between the two stands Mr. Markham's case ofManganese ores, showing all the varieties worked at the mine, including Pyrolusite (the most valuable),manganite, a variety supposed to be braunite and an ore mixed with iron. Hematite iron ore encrusting the manganese, is also shown. These latter ores were formerly thrown away as waste products, but have now become valuable in connection with the modern processes used in the production of steel. Beside Mr. Markham's case is a box of silver-lead ore from Mr. Wanamake of St. Martin's. The crown ornament of the Mineral Department for beauty and elegance, is the display of Petroleum and its products from the wells of Ontario. Nothing could be more chaste and striking than the ornamental work in paraffine wax, exhibited under Mr. Bullock's charge, in a large show case in the middle of the table. The centre is occupied by a handsome pyramid in bleached wax and the ends by ornamental tablets of the same material. The rest of the case is filled by masses of wax and various ornamental objects made from it. On the table near by are samples of crude wax, and of the tar, gum and coke taken from the distilling retorts; and also of the oil in various conditions, from the crude oil as it flows from the wells, to the products prepared for lubricating purposes and for illumination. Scattered through the building are other exhibits which may be considered as belonging to the Department of Minerals, such as the trophy of the Spring Hill Mining Co.; the marble manufactures of Messrs. McNamee, the freestone of the Budres & Bay of Fundy Co.'s and of J.M.Steeves and Co., &c.

But most of those have been described elsewhere."

(some Albertite);
Daily Telegraph - Jul. 23, 1864 Mining Matters in Albert. - Mr. McLellan, M.P.P.,who is in town, has shown us a specimen of a mineral greatly resembling some descriptions of coal. It has just been found in Hopewell in large quantities, and may yet prove to be exceedingly valuable. Coal, brighter in appearance and more oily than the Albertite, has been found in the parish of Hillsboro'. In the parish of Almaa large number of leases have been taken up by parties who expect to find copper, - among others by our townsman, Edward Allison, Esq., and Alexander Wright, Esq., of Salisbury. Albert is so exceedingly rich in mineral wealth that announcements of new discoveries are scarcely noticed now."

Evening Gazette - Mar. 2, 1892 Mining Notes. - The Alma Copper Mining Venture. -The Albert Coal Seam to be Reopened. - The New Brunswick Mineral Developing Company has met with good success in the work of organizing the Alma Copper Company, which is to open up the fissure vein of copper bearing quartz in Alma, Albert Co., N.B. The first five thousand shares of stock has all been subscribed, thus furnishing the funds needed for beginning the work of opening up to ascertain the value of the veins. Captain O.B. Brown, an expert in silver and copper mining, who has expressed the opinion that the vein to be opened up does carry a large body of ore, was to meet Mr. James Robertson, formerly underground manager at the Albert mines at Alma, today and with a number of men they were to commence operations upon the big fissure vein. The first work, of course, will be to determine the course and dip of the vein, and then to choose a site for the sinking of a shaft. The work will be pushed forward as fast as possible. The Mineral Developing Company has also secured possession of the Albert coal areas and propose to proceed soon with the work of opening them up in places to determine whether or not there is a sufficient body of coal there to make the mining of it profitable. A company made an attempt several years ago, to open up this coal vein on the Barrett property near Edgett's Landing, but owing to lack of funds or some other cause, they did not continue their operations long enough to determine whether there was a good solid body of coal there worth mining. They left off in a fissure, five to six feet wide showing 18 to 20 inches of Albertite coal with gravel on either side of it. It is believed that deeper down there may be a good solid vein."

Daily Telegraph - Aug. 7, 1880 Albert County. - ... Mineral Deposits. - Albert affords a fine field for the geological explorer, and the justly celebrated Hugh Miller would have found, here, many Schools and Schoolmasters to excite interest and stimulate his favorite study. Accepted theories might, however, be more disturbed than strengthened by a critical examination of the characteristics of this district. A considerable belt of metalliferous rock,follows the higher ranges from Shepody Mountain, westward to St. John County, and contains more or less of gold, copper, tin, iron and telluride -

quicksilver has lately been discovered, the locality known only to a few, andasbestos is reported near the western line, a short wayfrom the Bay shore. Alma is the parish richest in metals so far as known, and the copper beds there have exchanged owners at high rates, though little has yet been done in working. Pockets of manganese may be seen at Waterside and Germantown in Harvey and in Hopewell, where theMessrs. Steadman expended $60,000 in erecting works for manufacturing chemical products from local deposits. Lime rock is plentiful in Elgin, Harvey, Hillsborough and Hopewell, and in the last named parish, a company is engaged in its burning and preparation for market. Marble exists in several places, but has not yet attracted the attention of capitalists.Very fine freestone is found all along the shore of the bay and on the Petitcodiac. Two quarries at St. Mary's and one at Curryville on the railway line are being worked at present. Gypsum of the best grade outcrops in many places.The rock is being exported from Hopewell, about 3,000 tons being now ready for shipment; and in Hillsborough the Albert Manufacturing Co., at present managed by Joseph T. Tompkins, Esq., has, since 1854, carried on a large business. The proposed capital was œ50,000, and, in this case, the objects of the original charter have been exceptionally well carried out, though always laboring under the disadvantage of the high tariff of the United States. The company has continuously afforded local work for a number of men at all seasons, and has greatly promoted the carrying trade. Railways have been built; a superior factory has been erected to replace the one burned; and, with the necessary equipment of wharves, stores, warehouses, etc., the company has added much to the appearance of the village. The excavating, road making, trucking, cooperage work, grinding, calcining, barrelling, shipping, etc., have for a number of years secured for Hillsborough a hum of which few villages can boast. The recent increase of 7 « per cent duty on imported calcined plaster has, perhaps, enabled the company to place larger quantities in the Canadian markets, whatever may have been the counteracting influences of the tariff regarding it in other directions. The Hillsborough Plaster and Railroad Company of 1851 has not continuously operated. Other valuable gypsum properties are held by Sir A.J. Smith and others. Of these James Blight, Esq., is local agent, and this gentleman, in fact, did a great deal of initiatory work in developing the business. Coal in limited seams may be seen in everyparish, mostly cannel of inferior quality, but the most important carboniferous deposit, yet discovered, lies in the interior of Hillsborough. This has long been called Albertite, and was first noticed, accidentally, by the Messrs. Duffy in 1848, was obtained from the Crown in January, 1850, a mining licence over a mile square, and their rights were shortly purchased for œ3,000 by a company, of whom the late Edward Allison, Esq., was the chief promoter. A charter was granted in 1852, and the noted lawsuit ensued between Henry Gesner, Esq., a proprietor of the soil, vs. the Albertite Mining Co. Wilmot, J., the late Hon, J.M. Johnson and Hon. J.H. Gray, now a B.C. judge, were among the counsel employed. The trial lasted several weeks, and the twelve jurors, who were instructed to determine and report, what the substance was, must have found their first lessons in geology rather tedious while listening to words of learned length and thundering sound, employed in the testimony as given by several of the most celebrated scientific men of the Continent. The substance had the chemical properties of coal, but the geological formation differed from all recognized theories. It differed from the Trinidad asphaltum in luster and fracture. The savants were evidently puzzled; but the jury said it was coal. A later conclusion, however, made it consolidated oil, and it is now known under the name of Albertite. Between costly litigation and unskilful management the net earnings were small till, in the person of John Byers, Esq., the company secured the services of one, who combined practical knowledge with executive ability. In one year about 15,000 tons were shipped, worth $15 per ton on the wharf. Latterly the export is less, as the drifts are at great depth, and the facilities for cheap working are becoming more impaired. It is hoped that further searches may restore confidence in the extent of this valuable article. Albertite is also found in minute quantities in Midland and other parts of Elgin and in Hillsborough, and it is known to exist in Hopewell in considerable quantities, by an old discovery; when its value was unknown, which late searches have failed to recover. The Princess Alexandra, East Albert and Prince of Wales companies, of which Mr. Blight is manager, have each expended large sums in freehold leases and prospecting work, but excepting the finding of comparatively narrow veins of Albertite nothing has resulted beyond the very useful employment of labor in the locality. In Rosevale and other districts are found large quantities of oil shale or bituminous rock, containing about 45 to 50 gallons of refined oil per ton, besides a residuum of pitch or asphaltum, making the whole volatile matter over 60 gallons to the ton. The oil is very pure and exceedingly valuable for illuminating purposes. Mineral oil exudes from the soil on McLatchey's farm in Hillsboro, and at Hopewell Hill, but the coming millionaire, who will first strike a flowing fountain, is not yet known, either to himself or others."

Daily Morning Telegraph - May 9, 1865 Professor Hind's Report. -The Report is entitled ""A Preliminary Report on the Geology of New Brunswick, together with a Special Reporton the distribution of the Quebec Group in the Province."" It contains 293 pages, is divided into twelve chapters, and is supplied with an Appendix and a copious Index. Several maps in manuscript, illustrating the Geology of particular parts of the Province, were laid before the House at the same time as the report. The introduction contains a notice of what has been done by other Geologists in relation to the Rocks of the Province. A ""most creditable and able paper"" by our young townsman Mr. G.F. Matthew, is referred to in the language between our quotation marks. The late Dr. Robb's labours are highly spoken of, and the author ""ventures to express not only a very high opinion of the value of the work he has left behind him, but a strong appreciation of his trustworthy observations and of his scrupulously conscientious record of facts."" His works ""manifest viewsin relation to the once vexed question of the nature of Albertite (Albert Coal, so-called), which he would probably long since have successfully developed, had the Almighty been pleased to have prolonged his life."" The Introductory Chapter also contains a correspondence between Professor Hind and Sir W.E. Logan, in which Sir William most generously agrees on behalf of himself and his colleagues, Professor Hunt and Mr. Billings, ""to institute a comparison between the Geology of Canada, and that of her sister Colony, and in some degree to make available our ascertained results in forwarding your (Professor Hind's) investigations and promoting the development of her mineral resources."" Sir William also states that, ""In making serviceable in the investigation, the experience and practice we have acquired on the Canadian Survey, we should be only carrying out a suggestion which has already been placed before the respective colonies, by the adoption of which the labour of the investigation would be shortened and the cost cheapened, while a unity of design would be given to the whole subject, rendering the result, both economic and scientific, intelligible to the world with much less study than would otherwise be required."" Sir William asks no recompense for this laborious undertaking, and even offers to defray the expenses of the transmission of the specimens to Canada, if they become the property of the Geological Museum at Montreal. He adverts to the existence of the ""Quebec Group"" in New Brunswick, and points out its immense importance to the Province. The First Chapter is devoted to ""Leading Geographical Features"" and embraces some notices of the early history, derived chiefly from the Relations of the Jesuits, which abound in interesting memoranda respecting the condition of th country between the years 1611 and 2 672. As these ""Relations"" are written in the quaint old French of the period to which they relate, it is probable that some new historical facts will be found in this chapter possessing general interest; but as our object is to give an outline of the Geological features of the Province, we pass on to the second chapter, which relates to the nomenclature adopted by Professor Hind and to an outline of the Geology of New Brunswick. The nomenclature by which our rock formations are distinguished, is essentially the same as that adopted by Sir William Logan in Canada and recommended by Sir Roderick Murchison, the Director of the Geological Survey of the British Isles. Prof. Hind strongly objects to the introduction of a new nomenclature; he quotes Sir W. Logan's words in support of the necessity for employing names already well known in America and Europe in preference to new names for well known rock masses, and he argues that by this means a uniform system of colouring can be given to a Geological Map of the whole of British North America and the adjoining States of the Union, and an opportunity offered of ""rendering homage to those whose labours have aided us in understanding our own rocks,"" and ""that a stranger to the geographical position of the part of the country they represent may not be subjected to the trouble and loss of time which a new nomenclature so often involves."" In this respect we notice at the outset a marked difference between the Report of Professor Hind and the ""Observations on the Geology of southern New Brunswick"" by Professor L.W. Bailey, Messrs. Geo. F. Matthew and C.S. Hartt, which was laid before the House simultaneously with Professor Hind's Report. These gentlemen have introduced many new names for the Rock formations they have described and coloured on their Map with separate tints. - They have their ""Portland Group,"" ""Coldbrook Group,"" ""Saint John Group,"" ""Bloomsbury Group,"" ""Little River Group,"" ""Mispeck Group,"" ""Kingston Group,"" and ""Mica Schist Formation."" They employ on their Map fifteen different colours, and as Professor Bailey states, ""as far as possible the colours chosen are intended to represent the prevailing colour of the formations which they indicate."" In Chapter II, we find a lengthy description of the character and age of the Granite belt which stretches from the Atlantic coast of Maine to the Bay of Chaleurs. It is our guide to the leading Geological features of the country, and is stated to consist of a large number of narrow belts, not less than ten having been observed on the

Miramichi. - The important Metalliferous Slates of the ""Quebec Group"" come up between these narrow granite belts, which are represented to be of Devonian age. The southern Granite Belt is next described, and its relation to the metal-bearing series of the Quebec Group pointed out. Chapter III relates to the Carboniferous Series of 3 ew Brunswick. This is divided into the Lower and Upper Carboniferous, the Lower rocks being found in the Tobique Valley and on the rim of the Coal Basin from Bathurst to Oromocto, and thence to Westmorland, Albert and part of King's Counties. There are no workable seams of coal in these rocks, but abundance of Limestone, Gypsum, Grits for millstones, and sand-stones, firestones, ochres, bog manganese, &c. The base of these rocks consists of the Albert shales, which are described as very valuable rocks, more than one thousand feet thick, and in many places capable of yielding from 60 to 90 gallons of crude oil to the ton. They are regarded as of great importance as a source of Gas fuel for regenerating gas-furnaces, which are fast superceding the old blast and reverbatory furnaces in Europe and England. The true coal measures are shown by fossil remains to exist at Grand Lake, and the opinion is expressed that valuable workable seams of Coal will be found all the way from Grand Lake to the mouth of the Richibucto on the Gulf coast. Chapter 5, is altogether devoted to a discussion of questions relating to the origin of Albertite, and the Albert Shales. Albertite is shown to be an inspissated or hardened petroleum, and Professor Hind states that it will most probably be found in remunerative quantities from Apohaqui Station to Westmorland County, along a ridge in a North-Easterly direction, and along another ridge passing through the Albert Mine in a direction South-West and North-East. - The Petroleum, from which the Albertite originated, is stated to have its source in underlying Devonian rocks of the same age as those which yield the oil in Canada and Pennsylvania. The opinions of numerous Geologists are enumerated and discussed, and credit is given to Dr. Robb for having hinted at its true origin some fifteen years ago. Professor Bailey in 1864 pronounced it to be ""undoubtedly"" a highly bituminous coal, but we find from his recent ""Observations"" that he has changed his mind and now tells us that, ""in the opinion of Mr. Matthew and myself, the Albertite is neither coal nor jet, but an exydized oil, derived from the decomposition of fish remains, and subsequently changed by chemical action."" (Observations, &c., page 105.) The Petroleum Wells are next noticed, but Professor Hind thinks that the prospectors, where they are now working will have to sink 1200 to 1500 feet before they tap the main source of supply, for at the Albert Mine they have already sunk their shaft 1,000 feet, and found no petroleum. We notice, however, in a paragraph having reference to boring for brines, that petroleum might be reached in part of Sussex, and an adjoining parish. There are Parishes north, south, east and west of Sussex; which Parish is it? Among the conclusions advanced with reference to the origin of Albertite, the Professor states that there were two 4 eriods of injection from below, and that it occurs in all the rocks of Lower Carboniferous and, probably, Upper Devonian age, in this valley of the Kennebecasis and Peticodiac. Its distribution, as well as the occurrence in force of the Albert Shales, is regarded as of vast importance to the Province. A notice of the gas regenerative furnaces, by Sir Michael Faraday, is introduced in connection with the Albert shales of King's, Albert, and Westmorland Counties, and the opinion expressed that there is no reason why extensive metallurgical operations should not be carried on in the Province by means of the gas fuel of the above named counties. Chpater 6 is occupied with a description of theDevonian Series, and a lengthy account is given of the Vernon Mines, and the origin of the copper ores on the coast of the Bay of Fundy. These ores are stated to originate from copper-bearing intrusive traps, which have a wide and most important development in St. Martin's parish, east and west of the Vernon mines. The close of this Chapter brings us to page 126 of the Report; we shall continue the notice of

Codes: 0662 / X1 / IDX_Names: Vernon Mine; Grand Lake Coal;

S.J. Globe - Apr. 6, 1912 Consolidated Mines Ltd., with a capital of a million and a half, was organized at Moncton on Thursday in the office of E.A. Reilly. The parties interested are principally Montreal men with Geo. H. Trueman of Moncton. The company has acquired the copper mines at Goose Creek, also some coal area in Queens county, seven square miles

Weekly Record - Fri., May 19, 1899 A Mining Boom On. - A party of five Americans including expert mining engineers and representatives of capitalists, arrived to the city Wednesday afternoon by the C.P.R. their special mission being the inspection of mining properties in Albert County, concerning which the public has already been informed. The party, which is registered at the Brunswick consists of J.H. Cremier, an iron and copper mining expert of Cleveland; R.L. Martin, coal mining expert engineer of Pittsburg; R. Dufl (?) of Boston; A.H. Mugford and Major H.G. Cotlin, of New York city, the latter also being a mining engineer. They left this morning by teams for Baltimore incompany with Mr. M. Lodge and Mr. J.R. McDonald, of New York, who has been in Moncton for some time past in connection with the enterprise, to inspect the cannel coal property. They will probably spend a couple of days there. From there they go to Point Wolfe to examine thecopper and iron deposits in that region and will afterwards visit an iron property in Nova Scotia belonging to Mr. Lodge. Mr. Lodge, who is the original promoter of the movement for the development of the mining properties referred to, has been working up to the point of getting a deputation of mining engineers and capitalists to inspect the field and take hold of the project, and the present delegation is the fruit of his labors. The prospects now look bright for these mining properties, that have been so long lying idle, being worked, and the mineral resources of Albert being developed during the coming summer. Mr. Lodge's iron property in Nova Scotia and the properties in Albert are to be amalgamated under one company, and the probabilities are that the proposed company will be formed under the laws of New Brunswick. One of the undertakings talked of is the construction of a railway by the company from Baltimore to a point on the I.C.R., or to a deep water terminus on the Bay of Fundy for shipping purposes. A couple of other American mining engineers are expected here to-day to commence a survey of New Brunswick with a view to the development of the oil industry -

Moncton Times."

Codes: 0663 / B8 / IDX_Names: Mild Brook; Dunsinane Coal;

Daily Times - Oct. 26, 1895 An Albert county correspondent writes: The gold mine, situated one and a half miles from the Vaughan mill, at Point Wolfe, is the great attraction just now for the visiting stranger. This mine, as is generally known, is owned by a number of enterprising capitalists of Moncton and turns out a superior quality of gold, silver and copper ore. At present there is considerable excitement over the discovery of a new vein or seam, said to be larger and richer than either of the other two. A new crusher and separator will be brought here and set up about the first of November, and the work will then be pushed forward rapidly. Mr. John White and other gentlemen of St. John who are associated with him in the development of the coal seams at Dunsinane, Kings county, have had two carloads of the coal mined from the upper seam and sent to St. John for trial. Although the coal is taken from near the surface it is of good appearance and is an excellent burning coal in an open grate. In stoves it does not clinker, but leaves a reddish brown ash. The property, which is being further prospected, is situated near Dunsinane, about three miles from Penobsquis, and is only a very short distance from the line of the I.C.R. So far two seams have been discovered, an upper one of 17 inches and another 10 feet below of 13 inches. The proprietors will further examine and develop the property this autumn, and are hopeful of finding coal in sufficient quantity to justify the erection of workings on a large scale."

Codes: 0663 / S5 / IDX_Names: Mild Brook; Albert County Coal (some Albertite);

Moncton Daily Times - Oct. 16, 1880 Albert County News (From the Maple Leaf). - Copper Mine. - Mr. Daniel Cleveland, Alma, is at present engaged opening up a copper mine at the foot of Sinclair Hill. There can be no doubt that the Alma and Point Wolfehills are yet to prove a source of wealth to their inhabitants. It still remains to be proved, whether or not the elevated land known as Joel's Head contains a sufficiency of coal to pay the working. It is certain that it exists there, in greater or less quantities."

Daily Times - Apr. 6, 1898 Albert County. - (Special correspondence of the Daily Times). - Alma, April 4. - Robt. Dryden, who is prospecting for coal, is now boring on the farm of Edgar Martin in Hebron. The party he had boring for him in the shaft on the brook got discouraged and abandoned the work when they came in contact with a hard band of rock about one hundred and thirty feet from the surface. Leonard Martin, who is interested with Mr. Dryden in prospecting is trying to get the government's diamond borer to continue the boring in the shaft on the Brook.The present lessees of the mines at Mild Brook and Goose Creek are about closing with a company, who will spend $8000 prospecting at the aforementioned mines during the coming summer."

Semi-Weekly Telegraph - May 20, 1899 New Brunswick's Mineral Resources. - Have Attracted the Attention of American Capitalists and Scientific Men Who Are Going to Exploit Them. - Moncton, May 17. - A party of five mining engineers and representatives of American capitalists arrived here this afternoon from the United States to look over coal, copper and iron properties in Albert County and Nova Scotia with a view to the organization of a company with a large capital for the development of mining properties, the party consisting of Mr. Mugford of New York, J.W. Crenner, of Pittsburg. Mr. Martin of Cleveland, R. Duff of Boston, Major Catlin of New York, and J.R. McDonald. The latter have been in the provinces for some months prospecting. This party goes to Albert county tomorrow toinspect the Carmel coal property at Baltimore and also to look over copper and iron property at Point Wolfe. M. Lodge, who has been working for some years interesting American capitalists in New Brunswick mining enterprises, has the party in charge and the prospects are good for the organization of a company and the development of mining properties in Albert and other parts of the provinces. The construction of a railway from Baltimore,Albert county, to a point on the I.C.R., or a deep water terminus on the Bay of Fundy, is one of the projects talked of in connection with the proposed mining operations. Two engineers are expected to be here tomorrow to commence a survey of the province with the view of developing the oil industry."

St. Croix Courier - Mar. 31, 1892 Minerals of New Brunswick. - Extracts from a Paper by Prof. L.W. Bailey, of the Geological Survey of Canada. - From a paper by Prof L.W. Bailey, written for the Canadian Mining and Mechanical Review and published in the Crown Land Report, we take the following extracts concerning minerals in Charlotte county:- New Brunswick has, as yet, certainly established no claim to prominence as a mineral producing country. This is the more remarkable as within her borders are not only to be found those geological formations which elsewhere are usually the seat of valuable ore deposits but these occupy extensive areas, and present features in the way of plication, metamorphism, granitic and igneous intrusions, which would greatly enhance the probability of occurrence of such deposits. It is, however, to be remembered that very large portions of the province, and particularly those which might be expected to be metalliferous, are still densely forest clad, and that while the limits and age of the different rock formations have been worked out and mapped with a considerable degree of accuracy by the officers of the Geological Survey, but little has yet been done in the way of intelligent and systematic prospecting. ANTHRACITE. - This mineral is found to be limitedin extent in the Devonian rocks in St. John county. In many instances it is evidently the result of alteration, wholly or in part, of the individual trunks of fossil trees scattered throughout the sandstones of the Devonian formation; but in a few cases the vegetable accumulations would seem to have been such as to give rise to actual beds of coal, though of no great thickness. The best known locality for these beds is that of Lepreaux basin, near the western border of St. John county, and not far from the mouth of the Lepreaux river. A seam of mixed coal and shale is here met with, having a total thickness of fifteen feet; but the shale is irregularly distributed through the coal, and the latter, where purest, does not exceed a thickness of four feet, while it also contains much earthy matter. Analyses of samples from the outcrop, made by Dr. Harrington, gave 36.38 per cent of ash. The beds at this locality are all highly disturbed, and the area over which they are distributed is but small. MOLYBDENITE. - Molybdenum sulphide, or molybdenite has been observed at several localities, but chiefly in connection with the gneissic and micaceous strata, which border the great central granitic axis of the province, or in the granite itself. It has been thusfound near St. Stephen in Charlotte County, near thegranite belt in York county, and below the Pabineau Fallson the Nepisiguit river in Gloucester county. At the second of these localities it appears to be quite abundant. GRAPHITE. - Graphite or plumbago, in a finelydivided state, is not unfrequently disseminated through the altered rocks of the older formations to which it imparts a dark color and more or less glossy aspect. It is most abundant with the pre-Cambrian rocks which are believed to represent the Laurentian system in St. John county. Much of the limestone of this formation is dark grey or even black from this cause, while in places the graphite assumes the form of veins, pockets or well defined beds. A band of this character crosses the mouth of the St. John river at the falls, and is traceable both east and west for several miles. Mining operations for its removal have been frequently undertaken, and at one time (1868-1870) about 6000 barrels per year, averaging when crushed and screened about 4 cwt. to the barrel, were removed. The beds vary in thickness from one to four feet. The mineral itself is somewhat impure and incapable of being directly applied to the uses for which the finer qualities of graphite are employed, but has been found to answer well for foundry facings, stove polishes and the like, and by appropriate treatment can be rendered available for other purposes as well. Quite recently these mines have been reopened. Of other formations containing considerable quantities of graphite may be mentioned the Cambro-Silurian and the Devonian. The slates and schists of the former, as found near St. Stephen and elsewhere in Charlotte county and in the parish of Canterbury, York county, are often highly plumbaginous, but neither in these nor in the Devonian are there any known deposits of economic value. GOLD. - The amount of positive information regarding the presence of this metal in New Brunswick at present possessed is very small. Reports of its discovery have indeed been frequent, but in the very few instances in which these appear to have eminated from reliable sources the amount of gold observed has been so small as to discourage further efforts to obtain it. While, however, the amount of the metal actually obtained is thus insignificant, it is worth while to notice that rocks very nearly resembling those of the auriferous belt of Nova Scotia, and believed to be of the same age, are largely developed there, and further, that it is in connection with these same rocks that very many of the reported discoveries of gold have been made. The rocks referred to are those comprising the slate and quartzite belts which border the great central granitic axis of York and Northumberland counties, and which with the latter traverse the entire breadth of the province. Much of this region is still densely forest clad and difficult of access, but should any portion of it prove to be auriferous the discovery would be of inestimable value to the province, as helping to open up an extensive region otherwise likely to remain permanently in a wilderness condition. Among the points in which gold has been reported in small quantities may be mentioned the vicinity of the St. Croix river in Charlotte county, theNashwaak river above Stanley, in York county, the Muniacriver, in Carleton county, and the Serpentine river, inVictoria county. (to be continued)"

S.J. Daily Sun - Oct. 6, 1880 Minerals of New Brunswick. The Mechanics' Institute Collection of Useful Minerals. - One of the first objects which strikes the eye on entering the Exhibition Building by the main entrance door is the show case displaying the exhibits of useful minerals of New Brunswick sent by the Mechanics' Institute. This includes the collections of ores and products of several mines which after the Exhibition will be permanently on view in the museum of the Mechanics' Institute. The lower shelf of this case contains three strongly contrasted groups of products. On the left arethe dark colored minerals of the Albert mine, which has long been famous as the source from which a mineral resembling coal in many of its properties and yet distinct from it has been obtained in paying quantities. Mr. Ketchum, the obliging manager of the works, has sent with the coal various objects of curiosity and interest which serve to illustrate its relations and mode of occurrence of the coal. There are specimens of brown shale in which the coal occurs in various conditions, some with fishes perfectly preserved; others with scattered fish scales; others again are specimens of shell in contorted layers and with glossy surface. There are also concretions resembling cocoanuts, each with some organic substance at the centre, as a fish or a scattered cluster of scales. Other specimens sent show how the albertite or coal intersects the layers of the shale and does not lie between, as would be the case with a true coal. Such fine samples and large masses of the coal as are presented to view in this case are now rarely obtained.On the right hand of the Albert Mine exhibit are displayed the products of the Albert Manufacturing Co., from the crude, snow-white gypsum to the finished vase of alabaster. These products (except the vase) came from Mr. Tompkins, the manager and part owner of the property. Various grades of the plaster rock cut into blocks of convenient form and size, serve to show the nature of the mineral on which Mr. Tompkins operates. Then in a set of glass bottles are shown the products of the factory. First samples of calcined plaster for use in dentistry, etc. Samples of raw ground gypsum are also shown in two varieties, one for agricultural purposes, the other for use in the arts, this latter being the variety known as terra alba. A small quantity of each preparation of the powdered mineral is placed on blue paper to make the shade of color more distinct and to prove its purity. The second and third shelves of this case are occupied by specimens of useful minerals brought from the museum of the Mechanics' Institute. The utility of these is partly illustrated by objects of art made from them. The metals are shown here in great variety, there being ores of iron, lead, antimony, molybdenum, manganese, copper and zinc, some from mines that have been worked, but are now abandoned, and others from mines that have been in operation for many years. Many varieties of copper ores and ores of iron and manganese ores are here displayed. Various spars and minerals of non-metallic lustre are also present, most of which are of importance in various processes in the arts. Some for ornament as agates, carnelian, serpentine, and marble. Others that have been useful to the aboriginal inhabitants of the Province of New Brunswick for weapons and tools, as quartz and chlorite and jasper. Others again which their successors now make use of for the various purposes of modern life, as heavy spar and mica for optical purposes. Marble chalcedony and rock crystal for ornamental uses. A third group of specimens in this collection includes the combustible minerals, such as peat, albertite, bituminous coal and anthracite. Perhaps the most varied series of specimens fromany mine contributed to this collection is that furnished by the Hon. Francis Hibbard, the product of the Lake George Antimony mine. Mr. H. has begun at the foundation and sent specimens of slate or country rock, in which the veins of antimony are found. Then he has also a sample of the ore, showing the vein stone (quartz) mixed with ore. Three grades of the ore as it is taken out of the vein are also exemplified by specimens. Coming after these are three samples of the crushed ore separated from the quartz and mud by screening and washing. This ore is deprived of its sulphur by roasting, and is then passed into the smelting furnace. Samples of the fluxes, salt cake and rosin, and of the charcoal used in smelting, are present with this exhibit. In smelting a vapor passes off, which is condensed in the chamber connected with the furnace, being the oxide of antimony. This is exhibited in two varieties, one cream colored and another not so pure and of a darker shade. The final products are shown by two examples, one of slag resulting from the smelting, the other the regulus (or metal) of a metallic aspect and peculiar fracture. Opposite to Mr. Hibbard's collection is oneshowing the anthracite coal of Lepreaux and its associated rocks. Although not as pure a variety as might be desired, this is a true coal, lighter than the English cannel, but of a peculiar granular texture that causes it to crumble easily. It is of much interest as being the only workable coal known of so great an antiquity (being a product of the Devonian age). The shale associated with it presents the same glossy surfaces as those seen on the shale of the Albert Mine in the lower part of the case, but while this is brown, the shale of Lepreaux is black, and to the uninitiated seems the more valuable part of the product mined. The country rocks associated with the Lepreaux anthracite are fully shown by the specimen that accompanied it, and are of the same kind as the rocks which may be seen on the shore near the Exhibition Building. There are the same grey sandstones and grits (Dadoxylon sandstones), which form the point outside the railway terminus; these underlie the coal. And there are also the red slates (Cordaite slates), which may be seen in layers with green slates a short distance further east along the shore, in front of the Exhibition grounds. At Lepreaux these slates have limestone with them, and this is shown by a sample sent by Mr. G.K. Hanson to whom the Exhibition is indebted for all the specimens received from Lepreaux. ...... Between the Lepreaux and Hibbard exhibit is a collection of pieces of galena bearing quartz said to beargentiferous, received from Mr. Wannamake, St. Martin's, and perhaps from hills on the south side of Hammond River. Beyond the case in which these various collections are placed, are other cases of minerals which we propose to describe in a future issue."

IDX_Names: Glebe Manganese; Jordan Mountain Manganese; Gold Mine Gully; Teahan Mine; Stewarton; Philamaroo Silver, Gold, Copper; Kent County Coal;

S.J. Globe - Oct. 31, 1887 and Daily Times - Oct. 31, 1887 New Brunswick Mining Items. - Halifax Critic. -The manganese property at the Glebe, owned by F.J. Alley and others, of Bar Harbour, Maine, is showing up finely, and some quantities of ore taken out recently, are worth upwards of $200 per ton. The uses of manganese to some part of the electric business will create a new demand for the same. Mr. Alley and others are also making somedevelopments at Waterford, on a belt of metals which seems promising. The ore consists of yellow sulphuret of copper, and other metals in combination.Work at the Mineral Vale Mine in New Ireland, Albert County, is also being pushed forward. One of the principal proprietors visited the United States recently to examine various modes ot treating this class of ores; and it is said concentrating machinery of the best and latest description will be put in shortly. The prospecting for antimony, at or near Springfield, is steadily progressing under the charge of Mr. Gilbert Crandall, of Moncton. It is said the outlook is favorable. Very little is being done in the way of coal development at Weldford, Kent County. No late advices have been received from that quarter.The extensive manganese deposit I have so often written you about, at Jordan Mountain of White's Mountain, owned by Stockton and others, is about being disposed of to a syndicate of capitalists from Baltimore. A sample piece of ore was recently shipped to the parties in Baltimore which weighed 1,800 lbs. There is every evidence that the sale is bona fide, and the owners will receive $40,000 in cash for the property. Should no hitch occur in the negotiations, which we sincerely trust will not be the case, it will give a great impetus to mining matters in this vicinity. The existence of five veins of galena not many miles from Sussex, which show evidence of containing considerable gold, is worthy of the attention of capitalists."

S.J. Daily Sun - Jul. 15, 1881 [and similar version in Daily Telegraph - Jul. 15, 1881] Educational Institute. - Addresses by ... Mr. G.F. Matthew ... - Useful Minerals of New Brunswick. - ... Prof. Burwash, of Sackville, was received as an honorary member on the floor of the Institute... New Brunswick's Useful Minerals. - Dr. Rand then introduced G.F. Matthew, Esq., A.M., who delivered an interesting address on Useful Minerals of New Brunswick. Mr. Matthew said the first Europeans who settled in Acadia found themselves in a country abounding with game and fish and almost too well wooded. As the lumber resources were diminished the people were led to turn their attention to the products of the mine. The increase of manufactures in our midst will no doubt causea greater demand for our minerals and greater knowledgeof them will be of value. He would first give a sketch of the useful minerals of New Brunswick. In describing theuseful minerals he did not purpose to confine himself to the simple minerals, but to describe as well the variouscompound and impure substances of mineral origin, orcomposition, which are available for economical purposes.In this connexion various earthy deposits and rocks whichhave an homogenous structure will be noticed. There are anumber of these mineral species, which from theiroccurrence in large masses, or as being more valuable than others, are worthy of a place among the economical minerals; and among these the ores of metals hold a prominent place. Our knowledge of metals has grown up of late years, our ancestors knowing nothing of them. The occurrence of these metals in New Brunswick would be still unknown were it not for the researches which have given to modern chemistry the power to analyze and pick them out from their combinations. Prominent among the metals of vital importance to the community is iron. Ores of this metal are known to exist at several localities in New Brunswick but only those of Woodstock have been largely mined and smelted. The Woodstock ore is chiefly of the hematite species, and extends from Aroostook County in Maine to and across the St. John River into Peel parish of Carleton County. About 40,000 tons are said to be smelted in Woodstock Iron Works. Some of the iron ore beds of this district contain a large percentage of manganese. Similar manganese iron ores are found at Markhamville, King's County, and at West Beach, St. John County. A kind of iron ore which is a secondary product, resulting from the decomposition of other iron ores, is called bog iron. This ore is found in thick beds, especially in the carboniferous districts of York, Queens and Sunbury. Magnetic or black oxide of iron is a third ore of this metal, while a fourth one is thecarbonate. Beds of this latter ore have been found in the coal measures of Queens County and elsewhere. The fifth ore, which occurs in many places but usually in small quantities, is the sulphuret of iron. At Moore's Mills, Charlotte County, it is quite extensively found. The pyrites at this place is intimately mingled with calcite and the deposit extends in an east and west direction for several miles. Another metal occurring in large quantities in New Brunswick is manganese, which is extensively mined at Markhamville, King's County. Manganese ore is found in three other places - at Quaco, Shepody mines, and near Bathurst. The copper ores of New Brunswick are mostly sulphurets, but for some reason this mining industry has not had a healthy or continued growth. Adams and Simpson's Islands and La Tete peninsula in

Charlotte Co. and Salmon River in Albert Co. are the most promising places for copper mining. Galena or sulphuret of lead is the only metal of this kind in New Brunswick that is worthy of mention. It is an ore that in this region silver is often associated with. Zinc ore is not common in this Province but has been found in small quantities - at Campobello and La Tete in Charlotte Co. Antimony, a rare metal in most countries, is not uncommon in this. It is known to exist in at least four places among which Lake George in York Co. is best known, where operations have been carried on since 1862. Much of the ore is reduced at the mine and converted into metallic antimony. Among the minerals that occur in largequantities are gypsum and limestone. One of the most extensive quarries of gypsum is at Hillsboro. Some of the rocks are as white as snow. At Petitcodiac there are also large beds of gypsum, where it has a breadth of 40 feet, and is laid bare for a mile. Limestone and marble occur at many places in New Brunswick. Pure white crystalline marble and verd-antique marble are found in Portland, St. John County, and variegated red marble at Gagetown,Queen's Co. Of combustible minerals, four kinds in thisProvince are worthy of notice. Bituminous coal has been discovered at various places, and has been mined at"

Codes: 0691 / 0275 / 0310 / E5 / IDX_Names: Markhamville Manganese; Woodstock Fe; Adams Island;

Graphite; Lime - General; Albert Mines; Grand Lake Coal;

St. Andrews Standard - Jan. 12, 1870 From the Canada Year Book for 1870. NEW BRUNSWICK No mines of gold, silver, lead, tin, or other metals nor here under mentioned, are now being worked in New Brunswick. Iron is being raised and smelted to a limite dextent at Woodstock. There are no other iron mines worked, though available ores occur at other points. Copper - With the exception of a mine at Adam's Island, in Charlotte County, owned and worked by an English Company. ""The Casco Bay Mining Company"" - who still employ about thirty men, all the New Brunswick copper mines have been, for the present, abandoned. Manganese is being profitably worked at the ""Markhamville Manganese Mines"" in Upham, Kings County.Thirty men are employed, and the number is to be increased. In 1867-8, the trade returns show that New Brunswick exported 861 tons, valued at $19,019. Plumbago has been removed from two localities. From the first, at Portland, Saint John, 2,000 barrels, of 308 lbs each, have been taken. From the second at the Falls, Suspension Bridge, St. John, called ""The Split Rock Plumbago Mine"", - Mr. A. Garrit, director, - some twenty-five barrels a day are being taken out. Coal is now being mined in two localities only, the Albert Mine, near Hillsborough; and the mines at Newcastle Creek, Grand Lake. - It is doubtful whether the Albert coal is coal at all. Better to call it Albertine. Salt is being manufactured on a limited scale from brines near Sussex. The product might be much increased by judicious management. Lime is burned to a considerable extent at the narrows of the St. John, at the Green Point Quarries, &c.; on a limited scale at many other points. Plaster is quarried and calcined for exportation at Hillsborough. Almost all the above information has been furnished by Professor W. Bailey, of Fredericton."

Miramichi Gleaner - Nov. 23, 1861 Geological Survey. - Last week we penned some remarks on this survey, which we published. We give below some extracts from the Colonial Empire on the same subject, which convey some interesting intelligence respecting the Geological features and the Mineralogical capabilities of the Northern Counties:- ""It may not be generally known, that Sir William Logan extended his researches in Gaspe into this Province, as far as Bathurst, in order to complete his observations upon the limestone rocks of that district. These limestones are of the Silurian formation, and abound in the fossils which characterise it. When Sir Roderick Murchison, about twenty years since, was contending for the establishment of what is known as the 'Silurian System', he went himself to Archangel in Russia, and sent an Agent to this Province (the secretary of the Geological Society of Cornwall), who visited the Restigouche, and found close to Dalhousie, under the cliffs near the Bon Amie rocks, (Charlefort's Hill) in the Silurian limestones there, a variety of fossil remains well developed, which proved beyond a doubt the soundness of Sir Roderick's theory. When taken to England the fossils were found to correspond exactly with the fossils obtained from a similar formation, by Sir Roderick himself, at Archangel; and the soundness of his Silurian theory has not since been disputed. ""To the Southward of the Silurian basin of the County of Restigouche, there is a belt of metamorphic rocks which crosses the Province from Mars Hill to the Nepisiguit; in this formation copper and manganese have been found extensively, and gold was observed more than ten years ago. ""Passing over this belt of rocks, which stretch across the whole breadth of New Brunswick from Southwest to Northeast, and offer a great barrier to the construction of a railway through the entire province, there is found a wide extent of sandstone country,belonging to the coal formation, which extends along the whole eastern coast of New Brunswick, from Baie Vert to the Bay of Chaleur. From its wide base on the Gulf of St. Lawrence, this sandstone country narrows to the eastward, and on the river St. John, is found 30 miles from thesea, beyond the granite quarries at the head of the Long Reach. Between these quarries and the Bay of Fundy, there is another belt of metamorphic rocks, containing beds of altered slate with veins of quartz of the description known elsewhere as producing gold. That gold will be found in the district, there can be very little doubt; but in what quantity, has yet to be determined. A nugget of half an ounce was found several years ago, in the bedof the River Digdeguash, worn quite smooth by attrition, thus affording proof that it had been borne from some spot near the source of that river. ""At this moment, researches are going on at the expense of private parties, in the County of Albert, which bid fair to produce valuable results. In that country, in addition to the wonderful coal, called Albertine, which furnishes such quantities of Paraffine oil, other minerals of value have lately been discovered. Among these are veins of copper ore, which in beauty of colour and crystallization almost rival the Siberian malachite. A nodule of this ore bearing 60 to 70 per cent of copper, nearly egg-shaped, and weighing about three pounds, is now in the

City, and is intended to be sent to the Great Exhibition in London next year where there be little doubt it will attract quite as much attention as the gold of Nova Scotia. ""A mine of manganese in King's County has latelybeen opened, and is now being worked. - The ore is nearly black, highly crystallized, and is being carted to the Railway Station at Sussex, for transport to this City, whence it is shipped to England. Last week quantities of it were at the Sussex Station, affording ocular proof of the mineral wealth of New Brunswick. ""All these things point out clearly the absolute necessity of a complete Geological Survey of this Province, by competent persons. There is evidently great mineral wealth within its boundaries, and the structure of its rocks from the St. Croix to the Restigouche, are of a character to indicate that they are worthy of the most careful examination, and will furnish much mineral wealth of various descriptions, Gold included."

Kings County Record - Feb. 15, 1929 Should Stimulate Mining Activity. - Locations of Areas in Kings County Where Prospecting is Now Being Carried Out. - Geological Formation Explained by Mr. H.G. Wildman, of C.N.R. - The following details of the mineral resources of Kings County are culled from an extensive report of New Brunswick mining activity prepared by Mr. H.G. Wildman, mineralogist of the Canadian National Railways. He writes in part as follows: It is a matter of common knowledge that the deposition of minerals is more likely to occur in certain series of rocks than others. It therefore follows that, in dealing with the subject, it is necessary to pay some regard to the simple aspects of the geology of that area under consideration. The province of New Brunswick embraces an area of 27,985 square miles which may be roughly classed in three divisions, as follows:- (a) The northern section, the New Brunswick Highlands, a series of granitic hills, which may be said to commence with Mars Hill, situated near the Maine border, in the county of Carleton, rising 1,650 feet above sea level and forming one of a series of numerous peaks extending to the Baie de Chaleur to the northeast, having an average width of about forty miles. (b) The low-lying region in which is found the coal district of Chipman and Minto. This basin is remarkably uniform in its height above sea level, averaging in the neighborhood of 185 feet. There is, however, a slight rise near Coal Creek of 259 feet. (c) The plateau, surmounted by a range of hills, extending through the counties of Charlotte, Kings, Saint John, to Albert and Westmorland. The highest of these peaks is the Chapel on the road to Sussex Vale, which has an elevation of 1,140 feet above sea level. The whole country has been more or less glaciated, the ice, on its recession, having left a heavy covering of drift and boulder clay which to a large extent conceals the rock formation, this condition, together with the very general dense brush, renders prospecting extremely difficult. An overburden of 20 feet is frequently encountered. The general contour of the country has little changed since the Pre-glacial Period. The larger riversfollow virtually the same course as that along which they flowed prior to the advent of the ice. At the same time, areas are to be noted where changes have occurred in the surface of the country and the filling of the then channels by glacial drift have caused new channels to be cut through the surrounding country. There is abundant evidence of a greater elevation in relation to the sea level in early times, which caused the rivers to cut deeper channels due to the erosive action of swiftly running waters. From the Bay of Fundy, in a northwesterly direction, the topography of the county is characterised by a series of elevation and depression having a general northeasterly direction - a height of land stretching through St. John and Albert counties paralleled by a depression forming the valley of the Kennebecasis. The adjoining highland of Kings County include Jordan and Keirstead Mountains and other similar elevations of the series extending nearly to Moncton, paralleled by other series of highlands and lowlands across the province to the Quebec boundary. Antimony. - In the autumn of 1927 information reached this Department of a discovery of stibnite float over an area of about one mile in the Mountaindale (Marrtown) district. As a result of our investigations Messrs. R.G. Heughan and Company, and other independent parties in Montreal, were led to stake most of this area. Some development was carried on during the past summer on the Heughan and Brown stakings. No stibnite was found in place until September 1928, when a small stringer was discovered on the Heughan property. It is proposed to follow this up in the spring of 1929 as a large mineralized zone is indicated in the district. A reported discovery of stibnite at Stewarton, during well sinking operations was investigated. It was stated that two feet of stibnite was penetrated during the work but this statement could not be confirmed, owing to the well being full of water. There was no apparent surface indication of such an occurrence, but a thorough investigation will be made in the spring of 1929. Arsenic is found at Bellisle, in a very narrow veins in a basic lava. Copper. - Annidale, situated midway between Annidale and Scotch Settlement is the copper property now being developed by the Annidale Copper Mining Company Ltd., as the result of recommendations made to them by this department. Here a number of test pits have been sunk and a few carloads of ore shipped. The main shaft has been located between two outcroppings of mixed chalcopyrite and pyrite, averaging 7 p.c. copper, and has already attained a depth of 108 feet. It is the intention to drift on to both veins and a further program of diamond drilling is to be mapped out. At Irishtown, about five miles east of Annidale there is a nice showing of chalcopyrite, upon which no work has been done. On Jordan Mountain a considerable amount of work has been done disclosing a body of copper carbonate of low grade. Similar exposures of copper carbonate are noted at Goshen, to the southeast, where Consolidated Mining & Smelting Company have been diamond drilling. Gypsum. - At Upham, there is a very large depositof high-grade rock which lies contiguous to the Canadian National Railways line between Hampton and St. Martins, and about 25 miles from the sea. Five hundred tons of gypsum was shipped from this property in 1905 when the shaft was invaded by water from the river. Another very promising deposit is found adjacent to the main highway between Sussex and Apohaqui. It is very white in color and remarkably free from anhydrite. Manganese. - At Markhamville, eight miles southof Sussex, the mineral occurs in a grey limestone and is reported to have been the largest producer of manganese in New Brunswick, having shipped 30,000 tons some years ago. There is a considerable extension of the ore-bearing formation in which other bodies may be found and offers a promising area for the energetic prospector. Two assays of ore from this vicinity gave the metallic content as 44.65 and 42.77%. The property at Jordan Mountain is about six miles north of Sussex and has been worked by a trench 75 feet in length in what appears to have been a pocket of high-grade ore. Several hundred tons have in the past been shipped to the smelter. The property is now owned by J. Starr Tait, attorney, of Saint John, who is endeavoring to interest American capital in its further development. A selected sample from the district assayed 59% manganese. Near Jordan Mountain, shales, similar to those in Albert County, are found again near Sussex are two smallareas. Salt. - The occurrence of salt in the Carboniferous area of southern New Brunswick has long been known, a small operation having been carried on by George Hendricks, east of Sussex, in 1887, which was apparently the first commercial plant for the production of salt in the province. Saline springs occur in several places along the valley of the Kennebecasis and Sussex Vale, notably those at Upham and Anagance, an analysis of the former giving sodium chloride 1293.648 grs. per imperial gallon, that at Anagance having a similar saline content. The potassium content of these springs is low."

Codes: 0691 / X1 / IDX_Names: Markhamville Manganese; Grand Lake Coal;

S.J. Daily Sun - Jul. 25, 1888 (For the Sun). - The Manufacture of Iron at Saint John. - by Edward Jack. - It has been stated in a late paper that it is proposed to establish works at Halifax for the manufacture of iron and steel and that proposal includes the organization of a company to be called the Halifax Iron & Steel Manufacturing Company with a capital of $100,000 in 1,000 shares. Now as iron ore can be brought as cheaply by water to Saint John from the Bay of Fundy shores of Nova Scotia as it can be carried by rail to Halifax and as the harbor of Saint John is fringed with deposits of limestone some of which carry 98 per cent of carbonate of lime, it would seem that Saint John should even be a better place for iron manufacturing than even Halifax. I do not know whether there are deposits of coal anywhere in the vicinity of Grand Lake which arefree enough from sulphur to make coke fit for the reduction of iron from its ores. Only about one half of the sulphur disappears from the coal in the process of coking. Sulphur will be probably the only deleterious substance to contend with in Grand Lake coal as the coke made from it seems to be very firm and compact and capable of bearing the burden of ore. This is one of many other matters relating to our mineral deposits which should have been determined by our provincial governments, which without having reference to any particular persons or parties, have shown a most unaccountable apathy in bringing what mineral wealth New Brunswick has before those interested in such matters, so that those interested in knowing might have a distinct idea of what minerals we possess and their situation and character. The lime rock at the mouth of the St. John and the Grand Lake coal beds are surely worthy the cost and labor entailed in a careful investigation of their chemical constituents, and commercial uses and of the publication of the same in a small descriptive pamphlet to be accompanied by a sketch map. These suggestions are thrown out in the hopes that by arresting the eyes of the readers of the Sun, some future provincial government may be led to cause what is so necessary in this matter to be done. To return to the subject of iron. There is a bed of Brown Hematite situated 1 1/4 miles from the wharf at Old Barns, eight miles from Truro; the bed is seven feet wide; 500 tons have been hauled from it to Londonderry and there manufactured, so that it has been proved this ore can be placed on the surface at $1 per ton. The readers of the Sun can tell what it will cost to place it on the wharf at St. John. This ore is practically free from both phosphorus and sulphur, the former being as low as .021 per cent., the latter .015. The yield of metallic iron from the specimens which I found lying about the mouth of the shaft was 46.850. It is believed that the Brown Hematite ores at present being mined in the Lehigh valley will not average over 40 per cent. of metallic iron. For Tennessee, Georgia, Alabama and North Carolina the average is 43.2 per cent. I have seen more than 30 analyses of Alabama ores and find that none of them are so free of phosphorous as is the ore of this deposit. It is a Bessemer ore and there is abundance of manganese at Markhamville which could be brought cheaply to St. John to be used in the manufacture of Bessemer steel. For mixing with this Old Barns ore, rich specular ores could be brought from Nova Scotia or some of the Spanish ores so highly prized in Great Britain could be conveyed to the furnace in Spanish steamers which carry deals. Coal can also be brought from across the Bay of Fundy. The matter of iron reduction at St. John is one which requires a good deal of investigation and consideration. It seems to me that this investigation should be made at once, and I entertain no doubt but that a full and exhaustive enquiry respecting the adjacent beds of ore, coal and limestone will show that the city of Saint John is well adapted to be the centre of a great iron industry. It might be mentioned that a Swedish chemist and iron maker, a graduate of the famous university of Upsala, one who has had great experience in the manufacture of iron in America, wrote me that he found the Old Barns ore to be very easily reducible and that it was an excellent ore and free from

S.J. Daily Sun - Oct. 19, 1889 The Mines of Canada. - New Brunswick does not take a conspicuous position in Mr. Brumell's returns, but still makes a respectable showing. Here are the items with the values as far as the returns enables the New Brunswick product to be separated from that of the other provinces. Value Grindstones … 3,793 tons $30,729 Coal … 5,730 tons 11,650 Graphite … 150 tons 1,200 Gypsum … 44,369 tons 48,764 Plaster of Paris …50,000 bbls 31,000 Manganese (exported) … 1,181 tons 16,073 Building Stone … 1,953 yds 19,680 Lime … 440,225 bush 82,993 Bricks … 5,064 m 32,294 The statement does not include granite, which for the whole Dominion is valued at $147,305. This may be a fair statement of the value of the rough stone but it is far below that of the polished granite produced in this province alone. The returns of lime produced in the province are evidently incomplete. The New Brunswick lime exports for the year are stated at $97,318, and the value produced was, of course, considerably larger. Adding to the $300,000 credited to New Brunswick by Mr. Brumell the value of granite produced, we find that the mineral product of this province is considerably

Codes: 0697 / D7 / IDX_Names: Hampton Uranium; Kings County Coal;

Kings County Record - Jan. 28, 1954 Diamond Drills To Commence Uranium Search Next Week In Hills Of Hampton Area. - Confirmation of Geiger Counter Information to be Sought in Five Holes. - Noranda Active. - Big Company To Send Crew From Bathurst Development to Kings County. - Active exploration of uranium deposits in the Hampton area of Kings county will begin next week, it was announced in Fredericton yesterday. The announcement said further surface exploration and commencement of diamond drilling will take place on the property of Kingston Uranium Limited. Five drill holes will be selected in an area 1,000 by 1,000 feet, by Walter Sharpe, Toronto geophysicist. Noranda, one of the most famous names in Canadian mining, also is sending a crew to the area to do diamond drilling. The men have been working in the Bathurst area. In Old Mine The Hampton sector became the centre of miner's interest late last summer, when news leaked out that an amateur geologist, Roger Huntziker, had foundradioactivity in an abandoned coal mine in the hills behind Hampton. Prospectors from many parts of Canada converged on the area, and before their work was completed almost all the land between the Kennebecasis and Belleisle rivers as far east as Norton had been staked and claimed. Later the search extended to other parts of Kings County, with great emphasis being placed on the hills behind Hammondvale and around Londonderry, as well as in the Goshen section along the border of Kings and Albert counties."

Codes: 0697 / E2 / IDX_Names: Hampton Uranium; Oil and Gas - Kings Co.;

Kings County Record - Sep. 3, 1953 Hills Near Hampton Attract Miners' Interest as Stakers Scour Section for Uranium. - Dave Coleman Farm on Ravine Road Centre of Hunt For Wealth. - Shiretown Booms. - Merchants and Restaurant Owners Kept Busy as Movement Shows Increase. - Kings County's rugged hills, focal points in searches for base and precious metals periodically since early in the century, and kicking off places for oil drilling exploration five years ago, today are being overrun with ambitious prospectors who hope to find the magic uranium. In the hills back of Hampton, on the farmland of Dave Coleman, the latest prospecting rush is gaining momentum after weekend announcements that evidence of uranium had been found there. Meanwhile Mr. Coleman is watching developments calmly as those who hope to get rich quickly stake claims on his Ravine Road farm. To him, it means right now that two sons of his are working for claim stakers and are receiving $7.50 a day for their efforts. The fabulous wealth is problematical; the $7.50 per day is factual. Limited Information. - Just what the find between the Kennebecasis and Belleisle rivers will produce in uranium of marketable qualities remains to be seen. Only a small bit of information can be gained by the geiger counter toters patrolling the land now. Some of the prospectors appear to be quite enthusiastic about the possibility of a mining development ensuing. Others are more inclined to caution in their statements. But their numbers are growing daily, and if there is any radio-active mineral in the area it will set someone's ears buzzing as the search extends to surrounding sectors. Some of the prospectors are professionals employed by leading Canadian mining and exploration companies. Others are amateurs who hope they will strike something which will relieve then of the necessity of daily financial worries. … Reports in the shiretown said a Newcastle Bridge man, Roger Hunziker, first stumbled upon the radioactivity of the area and began quiet investigations. Later the mining fraternity learned of his work and a rush began. In addition to the work being done in the Hampton area, several other sections of Kings and adjoining counties have been staked off in recent weeks for possible mining development. Shell Exploration New Brunswick Limited drilled test holes at Urney and Apohaqui for the Shell Oil Company about five or six years ago and although no announcement of oil finds were made, there have been persistent rumors that the search was not entirely wasted, and there remains the possibility of further exploration work near Sussex and in other parts of southern New Brunswick."

Daily Times - Oct. 11, 1897 Mining in Albert County. - A correspondent of the St. John Sun says: Indications are now that mining operations throughout Albert county are to be carried on in the near future to a greater extent than for many years past. Mr. Hoyt, manager of the company now operating the manganese mines at Dawson settlement, haspurchased the manganese sites at Waterside and Elgin, andwill also operate for this mineral at Chemical Road. At all of these localities the prospects are considered good. At Dawson a very large vein has been struck, and plant has been put in worth over $30,000.At New Horton is a very promising copper mine, to which H.J. Bennett and others are interested, including Sir Charles Tupper. The quartz mined there also shows satisfactory indications of silver. It has also been learned that the company operating at Dawson have incontemplation the purchase of the well known Albert coal mines, which have been closed for several years. Albert county is undoubtedly rich in mineral resources, including gold, copper, coal and manganese, and capital and push are all that is necessary to develop an industry whose beneficial and far reaching efforts would be surprising. Mining development in Albert county was materially retarded some years ago by several operators who took out leases and failed to carry on the work with any system. It is probable now a period of mining activity is near at hand, and this, should it come about, cannot fail to be a boon to the country, especially so as the lumbering business is evidently in its decadence at least for a period."

Daily Telegraph - Sep. 6, 1866 Mining Matters in Albert County. - To the Editor of the Telegraph:- I have much pleasure in informing you that at present the Agricultural prospects of this section are magnificent, and that the development of our Mineral resources is being pushed forward...The Albert Coal Mine Company have shipped some 10,000 tons; have 1300 tons on the wharf awaiting shipment; and are raising, probably, 100 tons per day. The Alexandria Coal Mining Company, - under the direction of Mr. Blight - operating a short distance to the westward of the Albert Mines, have sunk one shaft 160 feet; and are now engaged in another, which they have sunk to about the same depth; and are putting up a powerful steam engine to facilitate operations. The East Albert Coal Mining Company are operating to the eastward of the Albert Mines, about half a mile from the Petitcodiac River, where they have discovered several small veins of a very superior quality of Albert coal. They have sunk several trial pits on the vein, and are now engaged in sinking a permanent shaft near the great road, and have got down 160 feet. They are also going to put on this mine a large Steam Engine immediately to enable them to go down more rapidly. The Prince of Wales Company have sunk to the depth of 462 feet North East of the Albert Mines. At the present a temporary suspension has taken place with this Company; but I was informed by the agent that they would resume operations immediately. The Victoria Company, located near Stoney Creek on the Petitcodiac, after going to a depth of 400 feet, have for the time being closed, on account of the recent high rates of gold. C.D. Archibald, Esq., of England, hasexpended a large amount of money on roads and bridges to aid the development of the Albert shale; has erected lodging house, machine shop, saw mill, and partially opened several of the rich mines; and is now in a position to commence manufacturing to any extent, as soon as circumstances will permit. Mr. Dunlop, in Elgin, has had several men since early in the season engaged in developing the Shales on Coverdale River and Prosser Brook, the result of which, I think, has not yet been proved, but I believe he is very sanguine of success. He also has in course of erection, and nearly completed, a large Steam Factory, (near the Petitcodiac Station) for the manufactory of spools and 13other articles. He met with considerable loss lately in lumber, by the freshet, which may retard progress somewhat. Messrs. Vernon and Kinney have had some hands employed for quite a length of time, in opening theirCopper Mines in Alma. The Manganese Mining Company at Hopewell, - where a superior quality of that article has for a number of years been obtained to a considerable extent - has been mostly engaged of late in making new openings and preparing for future operations. This very brief (but accurate) account of what is actually transpiring must not be supposed to exhaust the resources of this County, for as yet they are scarcely touched. ALBERT"

Codes: 0721 / J8 / IDX_Names: Shepody Mountain Manganese; Albert Mines;

Chignecto Post - May 19, 1881 Some interest is felt as to what course will be taken by the Albert Mining Co. at their annual meeting in June. In the meantime, it is rumored that the men at the mines will be employed in opening the manganese mine of Messrs. Ketchum, Byers, and others, at Hopewell Hill, work at which will be commenced early in June."

Royal Gazette - May 7, 1856 Passed 26th March. An Act to amend an Act intituled ""An Act to incorporate the Albert Mining Company."" An Act to incorporate the Hopewell Chemical Manufacturing Company. An Act to incorporate the New Brunswick Oil Works Company."

Codes: 0721 / O3 / HILL / J8 / IDX_Names: Shepody Mountain Manganese; Hopewell Gypsum; Grey Brook Gypsum; Albert Mines;

Daily Telegraph - Feb. 22, 1878 Albert Sketches. - .... Riverside .... Gypsum and manganese are found in its neighborhood, althoughthey have not been worked yet to any advantage. Good building stone (sandstone) is met with in abundance behind the village. .... The chief business going on at Hopewell Hill justnow, is the work at the gypsum mine. This mine is situated about two miles from the village, on the bank of a small lake called Silver Lake, from which the gypsum takes its name, being called in the United States markets, Silver Lake plaster. It is of the best quality, being almost perfectly pure and free from lime, with which it is often found associated elsewhere. At present there are about forty men employed in digging it out and hauling it. It is first blasted into lumps which one man can handle readily, it is then hauled some three miles and a half to a landing on the Shepody River, where it lies till spring. It will then be shipped to the States. From twenty-five to thirty teams are at work every day hauling it. It will cost, when put aboard ship from 90c. To $1.00 per ton, freight to Boston from $1.50 to $1.75 per ton. The owner of the mine intends to get out 4000 or 5000 tons in the winter months that it can be worked advantageously. There is also a manganese mine in theneighborhood of Hopewell Hill, which was worked some years ago, but has since been abandoned, although the quality of the mineral is aid to be excellent. Hillsboro ...... The chief business carried on here is the preparation of of gypsum by the Albert Manufacturing Company. Their works are closed in the winter. The mine from which the gypsum is obtained is about 2 miles behind the village.The Albert Coal Mines, situated about 5 miles from Hillsboro, are also the means of circulating a considerable amount of money here. ...."

Codes: 0723 / X1 / IDX_Names: Memramcook Gold; Grand Lake Coal;
Moncton Transcript - Mar. 28, 1893 A bill proposing to incorporate the Memramcook Gold Mining Co., will be probably withdrawn as the company has been incorporated by letters patent. The growing attention to the coal ares of the province finds an index in a bill introduced by Mr. Ferris, incorporating The New Brunswick Coal Company with a capital of $300,000 and head offices in Queens County. The bill empowers the company to erect buildings and wharves along or on Grand Lake; to construct a railroad (4 ft. 8 1/2 inches) from a point at Grand Lake, Queens County to Little River, Sunbury County and may operate such railroad by either steam or electricity."

Codes: 0743 / S6 / IDX_Names: Adamsville Bog Manganese; Kent County Coal;
N.B. Reporter - Jun. 5, 1901 The people of Kent county are considerably excited over discoveries of mineral wealth recently made. Coal, of an excellent quality, has been found. For some weeks operations have been in progress at Carlyle, where, it was reported there were indications of large coal deposits. Quite recently a five foot seam of house and steam coal has been discovered and arrangements for active development are being made. Mr. Polley, of New York, mining expert, is organizing a company, the capital stock of which will be $1,000,000 with the object of working the mine as well as the manganese mines recentlyfound a few miles back of Carlyle. The head office of the company will be at Richibucto Review - Jun. 6, 1901 Coal Supply in Kent Co. - Company Formed With $1,000,000 Capital. - Buctouche, June 4. - The people of Kent county are considerably excited over discoveries of mineral wealth recently made. Coal, of an excellent quality, has been found. For some weeks operations have been in progress at Carlyle, where, it was reported there were indications of large coal deposits. Quiterecently a five foot seam of house and steam coal has been discovered and arrangements for active development are being made. Mr. Polley, of New York, mining expert, is organizing a company, the capital stock of which will be $1,000,000 with the object of working the mine as well as the manganese mines recently found a few miles back of Carlyle. The head office of the company will be at Moncton. Those interested in the mine are of the opinion that under favorable circumstances it can be made one of the most valuable properties in the province, and that no difficulty will be experienced in mining 1,000 tons a day after the preparations are fairly under way. It is the intention to build a branch railway to tap the I.C.R. at or near Coal Branch probably between that place and Birch Ridge. A large quantity of the coal will be shipped to St. John and the I.C.R. is also expected to be a good customer, but Montreal, Quebec, and River du Loup are the principle markets which the company hopes to invade. In addition to the coal property, the companywill also work a manganese mine recently discovered. Very little has yet been done on this, but an 18-foot seam has been found, and those interested are jubilant. Borings for coal have also been made in Dundas on the Cocagne river. The prospectors got down 800 feet and found three small coal seams. At that depth they struck a quick sand formation and moved their drill to another locality in the hope of avoiding it. They were successful, however, in getting enough encouragement to warrant them in making further search, and they are of the opinion they have struck a good thing. The seams already reached are thought to be an extension of the coal seams at Newcastle and at Coal Branch." St. Croix Courier - Jun. 6, 1901 Mr. Polley, of New York, mining expert, is organizing a company, the capital stock of which will be $1,000,000, with the object of working the coal mines at Carlisle, Kent county, as well as the manganese mine recently found a few miles back of Carlisle. The head office of the company will be at Moncton. It is the intention to build a branch railway to tap the I.C.R. at or near Coal Branch."

Codes: 0744 / G3 / X1 / IDX_Names: Coal Creek; Granite; Grand Lake Coal;
Daily Telegraph - Oct. 28, 1880 Mining Resources. - Queens County, after Albert, is the next important mining county in the Province. Iron ore is found in various localities, but so far it has never been mined, but the coal fields of the country are extensive and have been worked for sixty or seventy years past. The principal mines are situated at Newcastle, near the head of Grand Lake, where many thousand chaldrons are raised annually, finding its market chiefly in St. John. Coal is also found at Salmon River, Coal Creek, and at Clones, in the parish of Petersville. The vein or seamis horizontal, or nearly so, and is rather thin, being only from 18 to 24 inches in thickness. There has been much speculation as to the existence of a lower or thick vein, and efforts to find it have been repeatedly made. A company bored for the lower vein

some forty or fifty years ago at Coal Mines, Salmon River, and within the past eight or ten years the Government Diamond Drill was operated at Newcastle and other places, in one case obtaining a depth of about 700 feet, but without making the desired discovery. Whether or not it settles the question of a thick seam of coal in that locality is still a matter of opinion. Some time ago the then Government of the Province gave certain parties leases to raise coal at Newcastle and vicinity, and out of this a good deal of tedious litigation grew. The late Silas McMann, Esq., and Messrs. Berton of St. John (who held one of the leases) to enter upon and disturb the soil of granted lands. This was finally decided in the negative, and eventually the Government bought up the leases again. For some time past there have been rumors of thediscovery of gold at Coal Creek. The percentage of reality in such discoveries is often quite small, but a late number of the Telegraph contains an advertisement, stating that the Annual meeting of the Coal Creek Gold Mining Company will be held on the 26th of October, and it is signed by W.C. King, who is himself a practical gold miner and ought to know what's what. Let us hope that the future historian of Queens may have something good to tell us about the discovery of gold at Coal Creek. I had almost forgotten to say that there is anexcellent granite quarry near the bank of the St. John river, in the Parish of Hampstead, from which many of our principal buildings have drawn supplies of material. It is quite a descent from gold to granite, but it may be that the latter will prove the more valuable property."

Moncton Daily Transcript - Dec. 1, 1891 Mining in New Brunswick.- An Exchange says: A mining epidemic seems to have seized upon the people of that part of the province extending from Sunbury to BayChaleur. On the Tobique a silver mine has lately been found, the particulars of which are yet kept from thepublic. Woodstock is becoming interested in silver and iron mining. Stanley appears to have gold and large quantities of iron. Manners Sutton and the adjoining partof Sunbury is rich in coal. Southern Carleton County has manganese in quantity and large pockets of yellow ochre. Prospecting is going on quietly in many places and New Brunswick may yet be entirely independent of her lumberindustry. About Bathurst we are told there is much activity over reported gold and silver finds, and the report of further discoveries of the famous Albertite coal in Albert are numerous."

Codes: 0758 / R8 / IDX_Names: Britton Mine; Dipper Harbor/ Lepreau Coal;

Moncton Daily Transcript - Dec. 2, 1889 New Brunswick's Mineral Wealth.- It is reported that the Clinch coal mine at Musquash is being worked very well. The main shaft is now 140 feet deep. The work of developing the Shaw-Britton mine about four miles above Woodstock is being conducted by Mr. Philips, a Colorado miner, who says that when the vein is tapped 60 or 100 feet from the surface the result will be a surprise to New Brunswick. Assays of twenty specimens recently made gave from $12.50 to $600 of silver to the ton and one specimen gave $100 worth of gold to the ton."

S.J. Daily Sun - Mar. 18, 1884 The Geological and Natural History Survey of Canada. - ...The report of progress of this survey for 1880-81-82 has lately been issued by the Department of the Interior ...Explorations have also been carried on in Nova Scotia and New Brunswick ... A considerable portion of the present report of progress is devoted to New Brunswick geology, showing a continuation of the work of the survey in exploring and mapping the eastern and northern counties, and treating of their mineral and agricultural resources, etc. Mr. Fletcher spent some time in the fall of 1882 in examiningthe curious copper deposits at Albert, Albert County, which occur in so many places as grey copper ore. One of these at New Ireland seems to be worth developing, but owing to litigation the work is now suspended. It is to Mr. R.W. Ells, however, that we are indebted for valuable reports on this section of the province, he and his assistants having surveyed and mapped the counties of Restigouche, Gloucester, Northumberland, Kent and Westmorland during the last four years. Four quarter- sheet maps on a scale of four miles to an inch, embracing the area included in the counties mentioned, accompany his reports. These maps are topographical as well as geological, compiled from the best sources extant, as well as surveys made by Mr. Ells and his party, beautifully colored, and embrace all the available information in reference to the geology, minerals, etc., of that portion of the Province. In regard to the minerals of economic value occurring in the eastern and northern counties, careful examinations of outcrops and openings were made wherever they were found and details noted. Coal seams were seen at several points on the carboniferous area, especiallyat Clifton, Caraquet and Shippegan on the Bay of Chaleur coast; on Dungarvon and Renous Rivers, Miramichi; in the vicinity of Doaktown; at Barnaby River, and at Napan and Black Brook near Chatham. All these outcrops, however, so far as ascertained, are thin and of no economic value. The thickest seams in this part of the Province now known occur in Kent county, but they do not exceed 18 inches, and are therefore not of sufficient size, considering the quality of the coal, to be worked profitably. They resemble the seam on Coal Creek and Salmon River near Grand Lake, with which they are probably connected and have been locally mined and used for blacksmith work for some years. The locality is on Coal Branch, a tributary of the Richibucto, near Ford's Mill, and about six miles from Coal Branch Station on the Intercolonial Railway. Among other outcrops, one on the Buctouche River in Bishopland Settlement having a thickness of 10 inches, was noted. The occurrence of such a large number of outcrops within the area stated renders it desirable that efforts should be made by boring or sinking shafts to test more fully and accurately the existence of beds of coal along the shores of the Gulf, although Mr. Ells is of the opinion that there is little hope of any being found of greater value than those met with along the western rim of the carboniferous basin, near Grand Lake.Reference is made to the copper ores occurring inthe lower carboniferous rocks at Dorchester, Memramcook,Upper Salmon River, Albert County, Bathurst and other localities. Deposits, apparently of considerable extent, are met with at some of these places, especially Dorchester, but they have not been opened sufficiently to ascertain their true value, and although ore of this kind (that is, the green carbonate and grey copper ore), is frequently found in this formation, it is generally in too limited quantities to be profitably worked.The deposits of argentiferous galena on theNigadoo and Elm Tree rivers, Gloucester County, were also examined, and analyses of the ores from these places were made in the laboratory of the Survey at Ottawa from samples that fairly represented their quality. A specimen from the Elm Tree mine yielded a little over seven ounces to the ton of 2,000 lbs., and one from the so-called Nigadoo silver mine nearly six ounces to the ton. Ores of this kind, carrying no larger a percentage of silver than these, are said to be profitably worked in some parts of Europe. Mr. Ells remarks that, as the strike of the rocks at the Nigadoo mine would run directly to that on the Elm Tree, it is possible the two may be portions of the one vein, much broken up, the character of the country rock, as well as the quality of the ore, being similar. These ores occur in rocks very near the base of the Silurian system, possibly in transition rocks between them and the next oldest in the series. Careful attention was given to the character of the soil in all the explorations, and the report contains much information which ought to be useful to the intending settler as well as to the practical agriculturist. The intimate relation existing between the geological formations of the country and the agricultural value of the soil is every day becoming more clearly recognized, and no better information could be placed in the hands of intelligent immigrants than a carefully prepared map, showing the different geological formations the Province contains. In the greater part of the district to which the report relates, settlements are confined to the belt along the shores and river margins. The best lands are stated to occur on Silurian and Lower Carboniferous rocks, both of which have a considerable percentage of lime in their composition. The fertile uplands of Carleton and Victoria counties, and the rich soils of Sussex Vale and other parts of King's county are referred to in proof of this statement. A large area of excellent farming lands underlaid by Silurian limestones and slates, Mr. Ells states, occurs on the Restigouche and its branches, in New Brunswick territory, forming a sort of upland district with a rolling surface. The country is, however, almost entirely in a wilderness state yet, and is chiefly remarkable as a source whence large quantities of spruce logs are obtainable. No roads pass through it, and travelling is confined to the river routes. A large proportion of this land is suitable for settlement, and can be made available as soon as means of access are provided. Fine tracts and ridges of cultivable lands were seen along the Dungarvon and Renous rivers, S.W. Miramichi; and between these and the N.W. river there is a belt of country with an admirable soil, much of it a rich black loam. At present it is also inaccessible and practically useless for want of roads. Many other valuable facts relating to the forests, minerals, climate, etc., are scattered throughout the reports of Mr. Ells, to which we have not space at present to refer. The practice of cutting down the hemlock for its bark, leaving the trunks to rot on the ground, the injurious effects of which must be felt before long, is deprecated. This along with the fires which devastate our forests every season, and the destruction of the spruce by a worm or borer, is rapidly depleting them of the more valuable kinds of timber which are becoming well nigh exhausted in many localities. In western New Brunswick, counties of York and Carleton, surveys and explorations have been carried on for several years and a map and report on the geology of that interesting region are now in course of preparation and will probably be published at an early date. When this is accomplished there will still remain the counties of Madawaska and Victoria, the northern part of Carleton and parts of the interior in York and Northumberland, also the eastern part of Westmorland to be surveyed and mapped out, all the rest of the Province having now been pretty carefully explored by the officers of the Geological Survey. It is to be hoped that the survey of the whole Province will soon be completed, so as to enable our people to obtain correct topographical and geological maps and accurate information regarding the mineral resources of their own country. If this were accomplished, the data relating to its rocks, minerals and soils could then easily be compiled into a hand-book or text-book for general use - at present an important desideratum - as much of the information published annually in the Reports of Progress, while of great scientific and economic value, cannot be understood, and is inaccessible to the general public."

Codes: 2026 / A2 / IDX_Names: Steadman Copper Mine (Crooked Creek); Albert / Kings County
Oil Shales;

Moncton Daily Transcript - Jan. 30, 1886 and S.J. Globe - Jan. 30, 1886 MINING IN ALBERT. - The Steadman mine on Crooked Creek has been worked for some time past, by Samuel H. Cochrane and Frank J. Sargent of Boston. The prospects are said to be good for gold and silver and there are indications of tin or some other ore not yet known - We might here say that the Englishmen, who recently examined the Baltimore shale, have not made any definite arrangements for proceeding with the work, and the figures recently given by many of our contemporaries are decidedly wrong. It is by noising abroad such silly and buncombe statements that the mining resources of Albert County have been incalculably injured, and honest mining concerns are losing faith in the county. We have frequently spoken at length about this matter, and hope that those who are anxious to give the public information will first go to the proper parties to get it. - Maple Leaf."

Codes: 2027 / E5 / GYP / Y1 / LIME IDX_Names: Bull Moose Hill Iron; Sussex/ Plumwesweep Salt; Gypsum; Salt
/ D7 / Springs Salt; Lime - General; Kings County Coal;

Daily Telegraph - Aug. 13, 1880 Kings County. - ..... Coal. - Some search has been made for coal, but hitherto with only partial success. Some loads of bituminous coal, closely resembling that of the Springhill mines, has been mined quite near the surface on the lowlands near Stone's Brook, at Dunsinane mills. Specimens of unmistakeableAlbertite were found some years ago in Mechanics' Settlement, and some land property changed hands at a good valuation in consequence, but the discovery was not further developed. More recently, Albertite has been discovered on the lands of Mr. George Teakles, at the head of South Branch, Cardwell, and a considerable effort has been made to test its value. Salt has been manufactured on a small scale for agreat many years beside the old Post Road, and midway between Penobsquis and Sussex. The manufacture is carried on by Mr. Mercer, the lessee of the property, by boiling in iron boilers, producing ten or twelve bushels a day, we are told. The excellent quality of this salt for dairy purposes is so well established that good butter makers in the vicinity will have no other, even though they may have to pay double the cost of other salt for it. Purchasers of butter in the city also not infrequently inquire as to what salt butter which they propose to purchase is preserved with, a preference being given, whether on real or imaginary grounds, for butter flavored with Sussex salt. Of several natural brine springs in the county only one other has yet been utilised. This is located at Salt Springs Settlement, Upham, some three or four miles distant from the St. Martins and Upham railway. The spring is a remarkably large one, and the salt produced a few years ago was apparently of equal excellence with the Sussex salt. The works are now out of repair and idle. There are here some remarkable indications that the salt deposit is not far from the surface, as in several places the earth has settled and fallen in, in some spots quite recently, which is believed to be occasioned by cavities underneath formed from the dissolution of the salt, which finds it way to the surface in the brine of the spring. It is not probable that the manufacture of salt will even be productive of large profit until a stronger brine or the rock salt itself is reached by boring as is done at Clinton, Seaforth and Goderich, Ontario. Salt is there very largely and profitably manufactured out of brine formed in the salt beds a thousand feet deep and pumped to the surface, boiled in immense boilers 120 feet long and 20 feet wide. There is good reason to believe that salt would be struck at half this depth at some points in Kings if borings were made and that the venture would prove a highly profitable one if undertaken. Plaster, etc. - Among other economical mineral products are plaster orgypsum, which is found in several sections of Kings and has proved an excellent fertilizer. Notwithstanding that it is native to Sussex there are still extensive importations of plaster chiefly from Petitcodiac. Lime stone crops out extensively in almost every section of Kings. Kilns for burning it are also quite numerous, including a large one on the farm of Mr. Wm. Pugsley atSussex. Lime is coming more and more into use as a fertilizer and with excellent results. Iron ore of excellent quality was reported yearsago as existing at Bullmoose Hill, in Springfield, and bog iron in several localities near Sussex, but as yet nothing has been done to develop their value."

Codes: 2050 / M6 / IDX_Names: Birch Island Gold; York County Coal;
N.B. Reporter - Sep. 24, 1890 Gold. - There is a report that gold bearing quartz has been recently discovered on Mr. Alex. Gibson's lands on the Nashwaak, by Mr. Samuel Napier, ex M.P.P. Mr. Napier has had experience as a gold miner in Australia, and should know of what he speaks, and when he says the land is rich in this quartz there must be some truth in it. It has been shown that coal in large quantities is to be found in several places on the Nashwaak, but no one has ever felt disposed to invest sufficient capital to develop the find."

Codes: 2052 / A2 / IDX_Names: Cross Creek Gold; Albert / Kings County Oil Shales;
Semi-Weekly Telegraph - Apr. 1, 1899 More Gold Areas. - Cross Creek Prospectors Are Still Coming In. - Fredericton, March 28. - The rush for areas in the Cross Creek gold district continues unabated. During the past two days eight hundred additional areas have been taken up. J.R. McDonald, a wealthy New York capitalist, is registered at the Queen. Mr. McDonald and his associates are arranging to form a joint stock company with a capital of a million dollars to develop the coal and oil deposits of the province. The proposed company expects to handle a thousand tons of coal per day before

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Morning News - Dec. 28, 1859 and Morning Freeman - Dec. 29, 1859 Caledonia Mining And Manufacturing Company. - We are informed that a specimen of the mineral taken from the Company's grounds in Albert County, was recently sent to A.K. Eaton, Esq., the celebrated Coal Chemist of New York; and he reports that upon examination he finds it to be most excellent; that he has examined many coals that yielded products of such superior quality:- that a gross ton of coal equal to the sample will yield 80 gallons of crude product, of which 6 per cent is ammonia water. The crude oil is very light, and loses only 20 per cent in the process of refining. The coal works easily at a low heat, and the lower the temperature of the retort, the better the quality of the products; there is left 68 per cent of coke, of excellent quality. He states that the sample is a true cannel coal, and cannot be called shale or schist; but from appearances, Mr. Eaton judges that a bituminous schist may be associated with it. For purposes of oil manufacture it is the best coal that he has ever examined. One hundred gallons of crude product would consist of - Refined light Oils, 60 gallons. Do. Heavy do., 15 "" Ammonia water, 6 "" Loss, 19 "" 100. We may also state that the steam engine and other apparatus have been sent up, and an engineer from New York is now engaged setting the patent rotary retort - it is expected that the works will be in operation by the 1st February next. At a recent meeting of the Directors, held in this City, William Jack, Esq., Barrister, was elected a Director of the Company, to fill the vacancy caused by the resignation of the Hon. W.H. Steeves. The following named gentlemen are the present Directors:- Edward Allison, Henry Vaughan, William Smith, William Jack, Oliver Jones, Alexander Wright, and the Hon. A.E. Botsford."

Miramichi Gleaner - Feb. 19, 1859 and New Brunswicker - Feb. 19, 1859 and N.B. Courier - Feb. 19, 1859 New Brunswick. - We understand that a very valuable and extensive discovery of bituminous coal has recently been made in the county of Albert, and judging from a sample we saw tested, must contain a very large proportion of oil, and from our knowledge of the parties whom we understand intend practically testing the discovery, (Hon. E. Chandler, Oliver Jones, Esq., and others,) we have no doubt of its commercial value being fully ascertained. Success to them we say and to all others engaged in the development of the latent resources of our Province. - Westmorland Times."

Morning News - Nov. 9, 1859 Caledonia Mining And Manufacturing Company. - A very full meeting of the Stockholders of this Company was held at the office of Edward Allison, Esquire, in this City on Thursday last, for the purpose of assessing the stock for such a sum as might be necessary to erect the works and carry on the business of the Company, and transacting any other business that might come before them. Wm. Jack, Esquire, was requested to take the chair, and Mr. Smith (Controller) to act as Secretary to the meeting. The report of the Superintendent of the works, John H. Harding, Esq., was read, from which and from the explanations of the Directors in reply to questions from the Stockholders, we give the following information. The property of the Company lies in Albert County, about four miles from the Albert Mines, and consists of leases for 99 years (with a provision to purchase at a fixed price) of 1730 acres of land; also a freehold of 76 acres, covering a portion of the locality in which the mineral, which is a bituminous shale or schist, is found in the greatest abundance and purest quality. The leases extend principally in the direction of the course of the Albert coal strata. The supply of the mineral is supposed to be inexhaustible and yields, according to Professor Robb, 58 1/2 gallons of crude oil from one ton of the mineral. Dr. Hayes of Boston only makes the yield 46 1/2 gallons crude oil per ton. Mr. Harding, Superintendent, obtained at the rate of 56 4 gallons crude, or 37 1/3 gallons pure oil. The works are rapidly progressing and a patent Rotary Retort has been purchased from the patentee, and is now on its way from New York with the necessary apparatus for working. The Superintendent expects to have the works in operation by the month of January next. The estimated cost of the works, including buildings, steam engine and boiler, rotary retort and apparatus, still tanks, crashers, &c., is £3000 currency, and the daily amount of crude oil estimated to be produced in 24 hours from 12 tons of schist (using only one rotary retort) is 500 gallons. The estimated cost of production, including quarrying the mineral, labour, fuel, &c., is seventy-five dollars, and the value of the oil is estimated at 176 dollars, leaving a daily profit of 100 dollars for one retort. An assessment of £1,500, or 2s. 6d. per share, was agreed upon by the Stockholders - one half payable in 30 days and the other half in 90 days. Two Directors having resigned, viz:- John H. Harding, Esq., who is now Superintendent, and the Hon. E.B. Chandler, a ballot was opened, when it was found that Mr. Wm. Smith (Controller) and Mr. Henry Vaughan, were elected Directors to fill the two vacancies. The stock of the Company is composed of 12,000 shares at £10 per share, and there were upwards of 8,000 shares represented at the meeting. The shares have been selling freely lately at £2 10s. per share, premium, or bonus. Only one shilling per share has been actually paid up."

N.B. Courier - Nov. 12, 1859 Caledonia Mining And Manufacturing Company. - A meeting of the Stockholders of the Company was held on Thursday last, at which Mr. Wm. Smith (Controller) and Mr. Henry Vaughan were elected Directors in the room of John H. Harding, and Hon. E.B. Chandler, resigned. The News states that the stock of the Company is composed of 12,000 shares at £10 per share, and there were upwards of 8,000 shares represented at the meeting. The property of the Company lies in Albert County, about four miles from the Albert Mines, and consists of lenses for 99 years (with a provision to purchase at a fixed price) of 1730 acres of land; also a freehold of 76 acres, covering a portion of the locality in which the mineral which is a bituminous shale or schist, is found in the greatest abundance and purest quality. The Superintendent expects to have the works in operation by the month of January next."

Morning News - Oct. 12, 1859 ADVERTISEMENT: Caledonia Mining & Manufacturing Company. A meeting of the Stockholders in this Company will be held at the Office of Edward Allison, Esq., St. John, on Thursday, 3rd November next, at 11 o'clock A.M., for the purpose of authorising a further assessment upon the stock, and for the transaction of any other business connected with the interests of the Company. Oliver Jones, Oct 12 President."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Morning News - Apr. 27, 1860 ADVERTISEMENT: Caledonia Mining and Manufacturing Company. -- At a special meeting of the Shareholders of this Company, held at the Commercial Bank Building, the 2nd of April, It was Resolved that an Assessment of Five Shillings per share on the capital stock be called in by the President to meet the requirements of the Company -- Notice is hereby given that the above Five Shillings per Share is made payable at their Office on or before the 10th day of May next. John M. Walker, April 9 President."

Morning News - Apr. 20, 1860 Caledonia Mining And Manufacturing Company. - At a recent meeting of the Stockholders of this Company, an assessment of five shillings per share was authorized to be made immediately, and a further assessment of five shillings per share whenever the Directors considered it advisable to extend the works. We believe there is no intention of doing so at present as there is little or no demand for the oil in the American market during the summer months. The President and Superintendent of the Company have recently returned from the States, where they were in negotiation with several persons who refine and sell oils. All admit that the crude oil is of a most superior quality; but as this is not the suitable time of the year to contract for any large quantity, and the market is very unsettled, the President did not deem it advisable to make any contract (except for a very small quantity) until the oil was introduced and known in the market. We have seen a report on the oil and shale recently made by Professor Hayes of Boston, and we subjoin a copy thereof, from which it will appear that the oil possesses very valuable qualities. We trust this Company will be successful in its operations, as in the event of it being a profitable business, their works will be extended, and this description of oil may eventually become one of the staple articles of Export of the Province. Mr. James Barber has been appointed Secretary of the Company. -- Report on the Oil Produced From The Schist of the Caledonia Mining and

Manufacturing Company. - Two samples of this Oil were received for examination. ""No. 1"", or Crude Oil, from the first operation on the Schist; its specific gravity 0.890 at 60 degrees Fahrenheit. 1000 parts by volume, etc. distilled, lose in gas, etc., solid residue 170 parts, or 17 per cent. The product thus obtained, had a specific gravity of 8.43 - was light brown in color, easily lost its contaminating matters, and suffered a reduction in volume of 9 per cent. 1000 parts purified, excepting for color, therefore lose 26 per cent. It is probable that this Oil refined into colorless and odorless Oil, will suffer a reduction of 30 volumes from 100 volumes taken, for the trials. ""No. 2"", or Oil from the first product, as obtained by a rough redistillation, specific gravity, 0.851. 1000 parts of this Oil purified, excepting for color, were reduced in volume 228 parts or 11 4/10 per cent. Only; the matter removed was largely creosote. The Crude Oil of this manufacture differs essentially from the Oils obtained from American Coals. It is naturally of less specific gravity, contains less crude heavy products, and affords more light Oil in volume when purified. It corresponds closely to the Albert Coal Oil, and has a high value for mixing with such Crude Oils as are naturally heavier, from the presence of paraffine, as it enables the manufacturer to obtain a higher proportional yield of burning oil from the mixture, than could be obtained from the heavier Oil worked without addition of this Oil. Excepting the product of the Albert Coal, I have not found among the great number of Crude Oils I have analyzed, any Oil which can be refined without a larger loss of volume. Respectfully, (signed) A.A. Hayes, M.D., State Assayer. 16 Boylston St., Boston, 9th April, 1860. -- Results of Analysis - Sample of Shale Received From the Caledonia Mining and Manufacturing Company. - This shale, differing in its amount of volatile matter from the samples before received, has been analyzed with the following results - 2000 lbs. slowly distilled, and the whole condensible matter obtained, afforded 464 lbs. of fluids. The reduction in weight was 600 lbs., or 8 Ammoniacal Water, 12 lbs. Coal Oils, 452 Gases which escaped, 136 Coke remaining, 1,400 2,000 The density of the Oil was 0.884 being produced at the lowest possible heat. 1 American gallon weighs 7 4/10 lbs., or a yield of Oils equal to 61 gallons, from 2000 lbs. of shale averaged. In quality, this oil maintained its high characters as before ascertained, and when produced at the most moderate temperature, it corresponds closely with the Oil obtained from Albert coal. Respectfully, (signed) A.A.

S.J. Morning Freeman - Dec. 4, 1860 and Miramichi Gleaner - Dec. 8, 1860 Export.- We are gratifying to learn that the Caledonia Oil Works Company sent down nearly nine thousand gallons of Crude Oil to be shipped by the Admiral for Boston on Monday. Many imagined that these works had suspended operations."

Morning News - Jan. 27, 1860 and N.B. Courier - Jan. 28, 1860 and N.B. Reporter - Feb. 3, 1860 and Morning Freeman - Jan. 28, 1860 Caledonia Mining And Manufacturing Company. - At a recent meeting of the Directors of this Company, held at the office of Edward Allison, Esq., a letter from Oliver Jones, Esq., President of the Company, was read, and his resignation accepted. John M. Walker, Esq., was unanimously elected to fill the offices thus vacated. The officers of the Company are as follows: John M. Walker, Esq., President; Edward Allison, Alexander Wright, William Smith, Henry Vaughan, William Jack, and Dr. LeBarron Botsford, Directors; John H. Harding, Esq., Superintendent; Mr. James Robinson, Secretary; and Mr. Joseph Salter, Clerk of the Works. The Secretary, Mr. Robinson, is to be found in Messrs. D. & T. Vaughan's office, Prince William street. specimen of the Coal, recently brought down from the mine, was laid before the Directors, and, we are informed that it appears to possess all the valuable qualities of the superior Scotch Cannel or Gas Coal. If such should prove to be the case, and if the Coal turns out to be inexhaustible, as the proprietors suppose, it will be immensely valuable both to the Company and the Province, as it is probable that many of the Gas Companies in America may be supplied with this material on better terms than they can import coal from Scotland. The coal has been tried on a small scale in the Gas Works of this City, and it produced Gas of an excellent quality. The Oil Works are nearly completed, and they are expected to be in operation in about ten days from the present time."

At the annual meeting of the Shareholders of this Company held on the 5th inst., it was resolved that an assessment of Five Shillings per share on the Capital Stock be called in. Notice is hereby given that the above assessment of 5s. per share is required to be paid at the office of the Company within Thirty Days from this date. (Signed) W. Jack June 6 President"

Morning News - Jun. 8, 1860 The annual general meeting of the Stockholders of the Caledonia Mining and Manufacturing Company was held on Tuesday last, when the report of the Directors was read, from which it appeared that up to the present time nothing had been realized from their Oil Manufactures. The Directors had been negotiating with several parties in the United States, but had not been able as yet to make any contract for their Crude Oil, except for a small quantity by way of sample. They had received very encouraging reports as to the quality of their Oil, but could not furnish the stockholders with such definite information as would enable them to come to any conclusion as to its ultimate commercial value. A resolution was passed for the further assessment of five shillings per share to pay off existing liabilities. It was understood that a special meeting of the Stockholders should be called as soon as the Directors were able to lay further information before them along with the accounts, showing the expenditure of the assessments already called in. The meeting was very fully attended and a good deal of discussion took place as to the state of their affairs and the unsatisfactory result of their operations up to the present time. The following gentlemen were elected Directors for the ensuing year, viz: John M. Walker, Edward Allison, William Jack, Dr. Botsford, William Smith, Daniel J. McLaughlin, and J.H. Harding; and at a subsequent meeting of the Directors, William Jack, Esq., was elected president."

Morning News - Mar. 21, 1860 Caledonia Mining And Manufacturing Company. - The works recently constructed by the Company for the manufacture of Oil in a crude state, went into operation on Monday, the 5th inst., and have been constantly working ever since, exceeding the most sanguine expectations of the Directors, as we are informed. The oil is made from the Company's mineral, which closely resembles the celebrated Boghead Coal of Scotland in many of its qualities. The quantity of mineral or schist, which has been manufactured since the commencement of operations at the oil works, gives an average of sixty-two gallons of crude oil of a very light and superior quality to the ton; although some charges have worked up as high as 72 gallons to the ton. The mineral or schist costs the company sixpence per ton, besides the expense of mining or quarrying it. If the Company should therefore ultimately decide to erect works for the purpose of refining the oil and making it ready for the market, it is probable that this oil will be furnished to the local public at a very moderate cost, and of a superior quality, as the chemists who have analyzed it all agree as to its excellent quality and lightness. The schist has also been tried on a small scale at the Gas Works of this City, and it was found to produce gas of the most white and brilliant description; and at the rate of about eleven thousand feet to the ton. It is not probable, however, that it would work practically on a large scale over ten thousand feet to the ton. A meeting of the Stockholders of the Caledonia Company has been called for the 2nd of next month, for the purpose of taking into consideration the property of making another assessment and extending their works. We learn that the President and three of the Directors have recently returned from an inspection of the works in Albert County, and that they express themselves much pleased with the operations, and are sanguine as to their prospects of success."

S. J. Daily Globe - Sep. 29, 1862 A New Discovery of Albertite. - About four miles from the Hillsborough Mine in Albert County, on the grounds of the Baltimore Coal and Mining Company, two veins of pure Albertite have been struck within forty-three feet of the surface, the largest upwards of a foot in thickness. This Company, which has been incorporated by act of Assembly, with a proposed Capital of forty thousand dollars, in four thousand shares of ten dollars each, are said to have a leasehold of 300 acres of coal land, and have been induced to make expenditures in searching, boring, &c., from the fact that the surface indications so nearly resemble those of the Albert mines. The surface-shale, the soil, timber growth, and general local peculiarities, have led to the organization of the Company. The different strata of the shale are interesting as shewing vegetable remains and fossil fishes of large size and in rare abundance. The Company are now about to sink a shaft, in order to extract the coal, and with the most sanguine hope of finding a still larger vein or field. -

S.J. Morning Freeman - Jan. 3, 1863 The Caledonia Mining and Manufacturing Company meet today. The value of the stock of this Company must have increased considerably since the supply from the Oil Wells has been found not to be

S.J. Daily Globe - Oct. 28, 1865 The Hillsboro' Advocate learns that C.D. Archibald, Esq., has been successful in forming a Company in England to manufacture oil in Hillsboro' from the Baltimore shale, and that gentlemen connected with the Company are expected there soon to arrange for commencing operations at an early day."

Morning Freeman - Mar. 6, 1866 ADVERTISEMENT: Notice. -- A special meeting of the stockholders of the Caledonia Mining and Manufacturing Company will be held at Stubb's Hotel in the city of Saint John, on Saturday, the tenth day of March next, at eleven o'clock, a.m., for the purpose of considering the propriety of transferring the property and winding up the affairs of the Company, and to take such steps as may be necessary for carrying out those objects; and to transact any other business which may be brought before the meeting. Dated 14th February, 1868. By order of the Directors, W.

S.J. Globe - Jul. 25, 1884 Oil from Shale. - E. Jack. - A few days since, when standing in the grounds of the Forestry Exhibition, at Donaldson's Hospital, I noticed in the direction of the Pentland Hills a tall chimney standing out on the horizon. On making enquiries, of Johnstone, as to what was manufactured, the reply was burning oil from shale. On enquiry, I found that nearly all of the illuminating oil used in Edinburgh and many other parts of Scotland is distilled from the same kind of shale which is to be found in the counties of Albert and Westmorland in New Brunswick. It is known in New Brunswick under the name ofCannellite, is of a snuff brown color and is remarkable tough. The rocks in which it occurs, lower carboniferous, have been much folded and disturbed in both of these Counties. On reference to the directory of the city of Edinburgh, I found five oil companies named in it which had offices in that city. On going to one of them, The Lanark Oil Co., 56 George street, I was politely received by the gentleman in charge who showed me some of their shale which is similar to ours, also some of their oils and paraffine. He said that the oil produced from the shale was not quite so good as the American oil, but there was much more paraffine and sulphate of ammonia derived from the shale than from the ammonia oil. The greases from the residuum were used for machinery. He further said that the Broxburne works has been paying 25 per cent per year for the last four years. I ascertained also that at the Midlothian Co., this year 10,000 tons of shale had been put through the Henderson retorts and 249,000 gallons of oil had been extracted, a yield of 24.74; the cost was a little over 3«d. The percentage of sulphate of ammonia was 10.31 lbs., the cost 72s. 6d. and the total yield was 185 tons. The total manufacturing cost of refining was 1 1/8d., with barrels, cooperage and cartage 2d. The whole percentage of the products obtained was burning oils, 33.5; lubricating oils, 19.7; scale, 11.5; total 64.8 and the loss 35.1. The cost of the shale was 4s. 2d. per ton. The cost of retorting at Broxburne was but 2 3/4d. per gallon. At this place immense quantities of oil and paraffine are made. It may possible be worth while for the counties of Albert and Westmorland, working at the above figures, to take into consideration the subject of their shale. Gas, I find, has been made from shale here as well as oil, to what extent I have not at present learned. Edinburgh, 16th June, 1884." Chignecto Post - Jan. 21, 1886 A correspondent of the Observer writes that on Wednesday last, John Stevens, Esq., of Baltimore, Albert County, received a letter from those English gentlemen who took the shale from that place last fall to England. After having it thoroughly tested it was found to be just the desired article. The letter also states that they will require 40,000 tons by June, and will take 140,000 yearly. They will require about 200 men and intend to build a branch railroad from Baltimore to some point on the Albert. The Observer congratulates all interested in this new enterprise and the county in general, on the good prospect of this new industry."

Moncton Daily Times - Jan. 27, 1886 Dawson Settlement. - ... All the talk now is -shale. Yes, Mr. Editor, the Baltimore shale mines are almost or quite sure to go on. The effects will certainly be felt for miles around, giving employment as the mines must, to many men and teams."

Moncton Transcript - Dec. 15, 1892 Bituminous Coal in Albert Co. - Salisbury, Dec.15. - [Special] - Messrs. W.F. Wortman, Frederick Steeves and others of this place who recently shipped a quantity of coal to Boston taken from a mine owned by Mr. Steeves in Baltimore, A. Co. have it is understood, received advice which justify them in believing that this bituminous shale or coal is fully as rich as they anticipated."

Daily Times - Apr. 12, 1894 Coal Mining in Albert County. - The incorporation of the Baltimore Coal Mining and Railway Company is asked for from the legislature. The persons whose names appear in the bill are Charles Archibald, Blowers Archibald, William F. Wortman, Frederick Steeves, Warren Taylor and Francis Ritchie. The head office is to be at Hillsboro, Albert County. Power is asked to construct and operate a railway from near Baltimore mines to some point of shipment on the Petitcodiac river. The capital stock is to be $300,000 in shares of $100 each. It is asked to exempt the property from taxation for 10 years, and power is asked to issue bonds to the extent of $10,000 per mile of the railway. The object of the company is to develop the coal mines of Baltimore."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Daily Times - May 2, 1894 Shale at Baltimore. - A Mining Engineer's Estimate of the Deposits and a London Engineer's Analysis. - It is already known that valuable deposits of cannellite shale have been discovered at Baltimore, Albert County, and Mr. W.F. Wortman of Salisbury is promoting the construction of a line of railway to the mines. Mr. William Hall, the well known mining engineer of River Hebert, Cumberland Co., N.S., has forwarded to Mr. Wortman the following report on the deposits: River Hebert, 12th April, 1894 W.F. Wortman, Esq.: Dear Sir: I beg leave to hand you my report on the cannellite deposits at Baltimore, Albert County, New Brunswick. I have examined all the various seams and the openings along the line of crop, which you will find as follows: Tons No. 1 Seam is 5 feet thick, yields ... 12,080,000 No. 2 seam is 4 feet thick, yields ... 9,664,000 No. 3 seam is 4« feet thick, yields ... 10,872,000 No. 4 seam is 20 feet thick, yields ... 77,312,000 West seam is 21 feet thick, yields ... 50,643,000 – 160,574,000 There are 9,000,000 tons included in the above that can be mined above water level drainage, which is a great advantage to these mines. There will be no machinery required for mining purposes for many years after mining operations are commenced. The cost per ton for mining this cannellite shale would be 80 cents, to handle, crush and put it on board the cars, 30 cents. These mines will cost very little for timber. This shale will be required to be broken up into egg size before it can be used properly. This shale is used principally for the large quantity of oil gas and tar it yields. I am clearly of the opinion that it cannot fail to prove highly valuable for fuel on ocean steamers, being a long flame cannellite and giving an immense heat. I anticipate the using of these shales among the common coal, as it yields so much oil and tar and would get steam up to its working pressure with less fuel, and the stokers would not have to work so hard. There are openings enough at present for an output per day of 1000 tons. Say 300 working days per year. It would take 535 years to exhaust it. The cannellite shale is used in Scotland entirely for oil, gas and tar, and the shale is sent to market just as it comes out of the mine. This cannellite shale will make a good house fuel, but not to use alone, requiring one half of its bulk of common coal to mix with

it. It is too rich itself, being a long flame cannellite, and the quantity of oil and tar it yields would make it unsafe to use alone, but with the above mixture will make a good fuel for all domestic purposes. The time is fast approaching when railway authorities will have to use some means of preserving their sleepers. The oil and tar that comes out of the cannellite shale, put into a tank in suitable solution, in its crude state, and the sleepers put into it for one hour, will add 5 years to the age and use of the sleeper. They will be good until worn out. The following also speaks for itself: Analysis of a sample of mineral cannellite received from W.T. Hill, Esq., 80 Cornhill, London, England, from Baltimore, Albert County, N.B. Practical Results. Purified Gas, per ton (correct volume) … 16,160 cubic feet. Illuminating power of cubic feet … 25,000 sperm candles. London Standard Cannel burner, burning at the rate of 120 grs. Per hour, Weight of Coke per ton of material … 8¬ cwt. Good Fuel … 8¬ cwt. Hydro Carbo absorbed per bromine … 21.0 per cent. Sulphureted Hydrogen in foul gas … 0.4 per cent. Carbonic acid in foul gas … 1.5 per cent. Carbonic oxide in foul gas ... 2.3 per cent. Value of gas from one ton coal in lbs. sperm . 1418 Specific gravity of material 1145 Analysis: {Volatile Matter ... 56.3 per cent. Coke {Fixed carbon ... 42.2 per cent. {Ash ... 1.5 per cent. – 100.0 Remarks. This is a very pure and good gas producing material. It produces a good coke, which is mostly combustible, as it contains very little ash. The amount of impurity in the coal is so small that a great saving would be effected in purifying the gas abstracted. I am clearly of opinion that it cannot fail to prove highly valuable as a gas producing material. Alfred Kitt, Engineer, Gas, Light & Coke Co. Works, Lupus St., Moncton Transcript - May 2, 1894 Cannellite Deposits. - Discovered in Immense Quantity at Baltimore, Albert Co. - If the analysis of Albert Kitt, of London, England, Gaslight and Coke Co. works of (Lupus street, Pimlico), and the estimate of the well known mining engineers, William Hall, of Nova Scotia, are correct the cannellite deposits at Baltimore, Albert county, are likely to prove of great value. Mr. Hall says he has examined the various seams and the openings along the line of crop and estimates the deposits as follows: No. Tons 1 seam, 5 feet thick… 12,080,000 2 4 … 9,664,000 3 4 1/2 … 10,872,000 4 20 … 77,312,000 5 21 … 50,643,000 – Total number of tons … 160,571,000 Mr. Hall says there are nine million tons in the above that can be mined above water level drainage, which is a great advantage in these mines. There are openings enough at present for an output per day of 1,000 tons, and if the estimate of quantity is correct, at this rate the mines it is claimed would not be exhausted in less than 500 years. The cannellite shale is used principally for the large quantity of oil, gas and tar it yields. Mr. Kitt's analysis gives the following as a practicable result: - Purified gas per ton, 16,060 cubic; illuminating power of 5 cubic feet 25.60 sperm candles, London standard candle burner, being at the rate of 120 grs. per hour. This, Mr. Hall says, is the highest standard of oil taken from cannellite shale in the known world today. Mr. Hall says the shale will also make a good house fuel, but not to burn alone, requiring one half of its bulk in common coal to mix, as the shale is too rich in itself, being a long flame cannellite, and would be unsafe. A line of railway is projected to the mines by the owner, W.F. Wortman, of Salisbury, who hopes to be able to proceed with the further development of the property."

St. Croix Courier - May 10, 1894 Albert county is somewhat excited over its cannelite deposits. An examination shows that there are 160,571,000 tons of the deposit. There are openings enough at present for an output per day of 1,000 tons, and if the estimate of quantity is correct, at this rate the mines it is claimed would not be exhausted in 500 years. The cannelite shale is used principally for the large quantity of oil, gas and tar it yields. The shale will also make a good house fuel, but not to burn alone, requiring one half its bulk in common coal to mix, as the shale is too rich in itself, being a long flame cannelite, and would be enough."

Moncton Transcript - Apr. 4, 1894 Mining at Baltimore A. - Salisbury, April 4.-[Special]. - A number of the directors of the Baltimore Coal Mining and Railway Company, of Albert county New Brunswick held a meeting in W.F. Wortman's office here yesterday afternoon. Considerable business was transacted and it was resolved to start mining the coal at Baltimore this spring as soon as the frost is out of the ground so that coal can be hauled to the railway. Should this coal give the satisfaction that the company have every reason to expect, it will be a great thing for the country as the supply according to the prospectus is almost inexhaustible. It is said that a great part of the stock will be taken by parties in Saint John,

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
S.J. Daily Sun - Jul. 1, 1895 Important Industry. - A company has been organized and a charter secured for working the rich slates or cannel coal of Baltimore in the county of Albert. It has been proved by practical tests, both on a large and small scale, that this material is valuable for fuel and all steam purposes. It is understood that J.H. Harding, late agent for the department of marine and fisheries, is interested in the enterprise, and from his experience and practical knowledge there is no doubt but that it will prove a great success. Many years ago Mr. Harding manufactured oil from this shale at Baltimore and therefore is well acquainted with it."

Weekly Record - Fri., Jul. 12, 1895 The latest rumor of a mining nature that is afloat is that a number of Montreal capitalists have become interested in the large and well known deposit of shale in the Baltimore district, Albert County, and that a strong company has been formed with the intention ofpushing forward the developments of the same at an early date. The formation of the company has been done by John Harding, Esq., of St. John. What the nature of the developments are or what uses the shales will be put to, is as yet not generally known, but should they be tangible there is an unlimited amount of the material in the locality named."

Moncton Daily Times - Jul. 23, 1895 Albert Co. - J.W. Patterson, surveyor, and Mr. Crossdale, C.E., are here looking out the most practicable route for a railway to the Shale mines."

Daily Times - Jul. 23, 1895 Baltimore Shale. - Mr. W.J. Crossdale, C.E.,yesterday showed a Times representative samples of the shale taken from the Baltimore, A. Co. property which is being developed by a company. Mr. Crossdale says there is an unlimited quantity of this shale at the place above referred to and that it is of a superior quality and as good as the fine samples shown. The surface shale is streaked with albertite, which is worth about $30 a ton. The shale is worth about $8 a ton, and can be quarried and shipped at a cost of about $2 per ton. It has not yet been decided from what point on the S. and H. railway, a branch line to the property will be built. The distance from Turtle Creek and Baltimore is the same, being about 8 miles; while the distance from Edgett's Landing is about 15 miles. From the latter place the shale can be

Daily Telegraph - Aug. 29, 1898 Moncton. - [Special to Telegraph] - Moncton, Aug.27. - A party of mining capitalists, including Walter Mand, of London, England, and Edgar Bronson, of New York, who are visiting the provinces on a tour of inspection of certain mining properties, visited Baltimore, Albert county, last week, and examined the cannel coal deposits at that place, with which they expressed themselves much pleased. In company with Mr. M. Lodge, of this city, the visiting capitalists also inspected some gold mining property in Nova Scotia, and returned home Thursday via Yarmouth."

Moncton Daily Times - Mar. 3, 1898 Albert Co. - Rosevale. - S.L. Steeves still continues his mining operations, having taken out quite a large quantity of shale."

Moncton Daily Times - Nov. 28, 1898 Mine on Fire. - The Hillsboro News says: The report that the Baltimore shale mine is on fire, is true, the fire being in the grey shale, on the west of Turtle Creek, and from appearance is likely to burn for some time. The heat is so great in the mine, that the oil flows out on top of the water in large quantities."

Moncton Daily Times - Aug. 26, 1899 Baltimore. - We are quite elated over the fact that mining operations, though only on a small scale, have again commenced at the shale works. About a dozen men are at work with Watson Lutes as foreman."

Gazette - Aug. 28, 1899 Operations on quite an extensive scale have been begun at the Baltimore, Albert Co., shale mine. It is the intention to get from 300 to 500 tons at once, which will be shipped to New York and thoroughly tested. Watson Lutz of Moncton is foreman at the works."

Daily Sun - Aug. 28, 1899 Albert Co. - Hopewell Hill, Aug. 25. - Operations on quite an extensive scale have been begun at the Baltimore shale mine. It is the intention to get out from 300 to 500 tons at once, which will be shipped to New York and thoroughly tested. Watson Lutz of Moncton is foreman at the works."

10Weekly Record - Fri., Mar. 31, 1899 Mining Operations In Albert Co. - The Fredericton Gleaner of the 28th gives an account of an interview had with Mr. McDonald, of New York, regarding mining operations which the company, of which he is a representative, propose to carry on in Baltimore in the county of Albert. Mr. McDonald says his company will organize with about $1,000,000 capital stock, and proceed with the erection of works, which will cost $200,000, before they will be in a position to put their property upon the market. The material the company will mine and export will be the Baltimore shales, which were used some thirty-five years ago for the production of a superior kind of illuminating oil called Albertite. Similar shales are to be found in several places in the parish of Elgin in the same county. Operations to the extent of a thousand tons a day will be mined and shipped at the commencement, which will be increased threefold in a year. This shale or coal will be sent by rail to St. John for shipment."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Daily Times - Jun. 22, 1900 Albert County. - (Special despatch to the Daily Times.) - Rosevale, June 18. - The mining operations are progressing very satisfactorily under the efficient management of foreman John McSween. The new tunnel is now 140 feet long and is being pushed ahead through solid rock by 7 men at the rate of about a yard every six hours. The steam drill in charge of Mr. Alex Sherwood is also making good progress, going down at the rate of about 20 feet per day, having already reached the depth of about 400 feet. It is said the indications for striking albertite coal are exceedingly good. It is the intention of the company to bore several holes in this vicinity to the depth of about 1,000 feet."

St. John Star - Apr. 1, 1901 A company has been formed in Montreal to develop the deposits of bituminous slate in Albert Co. The promoter is John C. Calhoun, grandson of the famous southern of that name."

N.B. Reporter - Apr. 3, 1901 John C. Calhoun has formed a company for the working of its large deposits of bituminous slate in Albert county, N.B. He expects to spend $500,000 in erecting a plant to secure an output of 3,000 tons per day. The company say that the deposits are similar to those found in Australia."

S.J. Star - Apr. 11, 1901 Albert County Mines. - The annual meeting of the shareholders of the Baltimore Coal Mining and Railway company was held yesterday at the office of H.H. McLean. There were present Hon. C.J. Osman, M. Lodge and J.N. Patterson, of Moncton; Francis Ritchie, of St. John; W.H. Steeves, of Waasis; Hugh H. McLean and H.F.

Puddington. The directors elected were: John C. Calhoun, James E. Calhoun, Henry Higgins, C.S. Daly, H.G. Catlin, all of New York; and Hon. H.R. Emmerson. The report of an expert mining engineer showed that the Albert shale was the best known, being tested in New York, London, Scotland and Italy. The borings of the past year have been down to 600 and 700 feet and rich veins of albertite coal have been found, some six feet in width. Legislation has been granted for a railway from Hillsboro to the mines. The controlling interest in the mines is held by New York capitalists, who are asking concessions from the government as to royalties, leases, etc., for a term of years. The company intends to put in a plant to make an output of 3,000 tons per day, employing in the vicinity of 3,000 hands. The government have already granted exemption of royalty on the first 500,000 tons output. - Telegraph."

Moncton Daily Transcript - Jan. 8, 1901 Explosion in Albert County - Fearful Accident in the Baltimore Shale Works - Baltimore, Albert County - January 8 - Archie Stevens, who works in the tunnel of the Baltimore Shale Works, met with a fearful accident on Friday. Mr. Stevens in one of the blasters. He works in a tunnel about 300 feet in and carries a miner's lamp fastened to his cap. A spark from his lamp ignited a can of powder -- probably seven or eight pounds. The explosion that resulted was terrible. Mr. Stevens' face was badly burned, the skin and flesh peeling off from forehead to chin and from ear to ear. His clothing also caught fire from the flash and in making a desperate effort to save his life, he tore the burning clothes from his body in shreds. In doing this his hands and armssuffered by the flames. Walter Bishop, who worked in the same place with Stevens, was not quite so close to the powder and escaped with a shock. Mr. Stevens suffers severely, but hopes are entertained for his recovery."

S.J. Star - Jul. 26, 1901 Coal Company Transfer. - In H.H. McLean's office last evening a meeting was held of the shareholders of the Baltimore Coal company to consider the proposed transfer of the property and interests to the Albertite, Oilite and Cannel Coal Co., lately organized and incorporated. Among those present was C.L. Calhoun of New York, who is largely interested in both companies, and who has invested $40,000 in the scheme for developing the Albert county shale as an enricher in the manufacture of gas. No action was taken last evening, and today it was decided to

S.J. Star - Sep. 3, 1902 Cannel Coal Deposits. - Two Gentlemen From New York are Inspecting Local Properties. - Col. W.H. Reynolds, of New York city and Thomas J. Finney, also of the same city, are in Moncton, looking over The Tide Water Cannel Coal Company's properties in this vicinity. These gentlemen are the principal promoters and principal owners of the property. During the past few days with M. Lodge they have been making local inspections of the properties with a view to determining the best mode of operation. The company expects to establish immediately on the Albert county side of the Petitcodiac a distillation plant, for extracting the oil from the shales. Col. W.H. Reynolds was the first person who made Queen Victoria acquainted practically with the telephone. He controlled the European rights from Mr. Bell the inventor, and on going to England, made a contract with the postmaster general, so that the rights could be controlled by the imperial government in the British Isles. ..."

North Shore Leader - Aug. 28, 1908 Albert County Shale. - Senator Domville visited Albert County a few days ago with a party to look over some of the shale deposits in the interests of foreign capitalists who are considering investing. The Albert Shale is said to contain sixty gallons of oil to the ton, and as there are millions of tons of it, a large business is expected to be developed in mining and refining this oil."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Aug. 3, 1909 Development Albert Shales Assured. - British Capitalists Have Been Looking at the Property and are Impressed. - The development of the large deposits of Albert shales, which are so rich in oils and bye-products, is now only a matter of time. Some time ago leading business men in this province interested themselves in the great mineral deposits of Albert and formed a company in which prominent British capitalists are interested. The prospectus issued shows that a very large sum of money will be required to carry on the enterprise but as things look now the capital will be forthcoming and work will shortly be commenced. The Albert shales have long been regarded as being of commercial value but it was not until a short time ago that their real worth was fixed. Under treatment such as is applied to the Scottish shales, it has been determined that oil and bye-products can be extracted from the rock in larger quantities than are secured in Scotland. This means that fortunes have been lying dormant in Albert county, as the shales of Scotland have made their owners very wealthy concerns. Dr. Ells, of the Geological Survey, who has been here some time ago investigating conditions reported most favorably on the values of the shales. Later he visited Scotland and his experience there strengthened the good opinion he had already formed as to the worth of the Albert deposits. Recently, Mr. McKenzie, a well known mining expert of Glasgow, Scotland, was on the ground and his opinion confirms those already given as to the richness of the Albert shales. Last week capitalists from Great Britain were here and made a thorough examination of the deposits and it is understood that they were well pleased with what they saw. Should they take hold of the proposal seriously, it will mean that several thousand men will find employment in Albert county in the vicinity of the deposits. The enterprise, when carried out, will involve an expenditure of several million dollars and will provide for the erection of large mills capable of economically treating the shales and separating the oils and bye-products from them. The latter include very large percentages of valuable fertilizers, which can be profitably handled with such shipping facilities as are to be had in Albert. The territory covered by the shales is very great, extending from Albert county to a point near Norton and there is a supply for any sized plant which will last for years."

Kings County Record - May 7, 1909A strong company is being formed for thedevelopment of the Albert shale deposits, which extends from Albert County to Norton. Dr. Ellis, of the Geological Survey, was here a couple of years ago and examined the deposits. Subsequently he went to Scotland and investigated conditions prevailing in the shale districts there. He found that the Albert shales were far richer in oils than those of Scotland, from the reduction of which fortunes have been made. Senator Domville and others are interested in the Albert shales. It is expected that a company with some millions of capital will be in operation before long. The industry will require the services of several thousand men."

S.J. Globe - Apr. 11, 1910 ADVERTISEMENT: The General Oil Shale Company of Canada (Limited) Notice is hereby given that the annual general meeting of the General Oil Shales Company of Canada, Limited, will be held at the office of the Company in Rothesay, N.B., on Friday, the 29th of April, at 12 o'clock noon, for the purpose of erecting a Board of Directors and transacting all such other business at the meeting as they may properly control. Thursday, 10th day of March, 1910 T.M. Robinson, Secretary."

Granite Town Greetings - Dec. 2, 1910 Gets Money To Develop The Shales. - Senator James Domville, who returned home yesterday on the steamer Empress of Ireland after a trip to England, reported having had a very pleasant voyage. He went to the old country to try to interest capital in the work of developing the property of the General Oil Shales County, in Albert County. 'All I can say about the matter at present' said the senator, 'is that we realized what we went after.' On his return to New Brunswick Senator Domville was accompanied by an engineer, J.C.D. Mackenzie, who will make a thorough inspection of the property and, as a result an active policy of development will be carried out. Senator Domville and the engineer will leave for Albert county early next week. - Exchange."

Kings County Record - Dec. 2, 1910 Albert Counties Promised Development. - The little county of Albert may be regarded as one of the richest in New Brunswick. The past two years have been filled with promise for that section of the province but the future has much more in store for its people, if half is accomplished that is in view. With her natural gas, oil wells and unlimited quantities of the richest shales in the world. Albert will undoubtedly occupy a very prominent place in the future of New Brunswick's growth. There are few who realize what may come to pass with the investment of the millions of capital that have been attracted to the development of the rich mineral wealth of this tight little county and it is almost certain that the people who have holdings in the municipality will derive very considerable advantages from the movement that is now on foot to place on the world's markets the products that Providence has placed there. The dream of a bigger and a more progressive Albert is about to be realized and new life will be injected into the affairs of the county. Albert promises to be populous and wealthy and the Record hopes that the dream may be brighter than it even now appears. Success in one direction means many successes in other directions, and Albert is well fitted for a commercial and manufacturing boom."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Dec. 9, 1910 The Big Albert County Industry. - The great industry that it is proposed to establish in the county of Albert in connection with the refining of oils from the shale deposits there seems to be an assured fact. The promoters of this gigantic undertaking have been working carefully for months and have at last succeeded in financing the big deal to their liking. The company will have a capital of $1,000,000 and it will erect preliminary works costing several millions of dollars. That the success of the enterprise is assured is admitted by many competent mining and oil experts who have been on the ground and reported on the outlook. Numerous companies have endeavored to float the undertaking but those behind it preferred to so conduct their negotiations that commercial enterprise would be established on a sound basis, instead of creating a mere stock jobbing proposition. That the Albert oils will find a ready market is admitted by all who are in touch with the oil situation. Taking the great shale enterprise of Scotland, dealing as they do with rock far less rich in oil and byproducts, as a basis of comparison, there is every reason to anticipate that millions of dollars will be made out of the Albert deposits. Not only will the financial backers do well but the county of Albert stands to thrive as a result of the venture. In order to work the company's holdings successfully, it will be necessary to employ an army of men, estimated in the vicinity of 2,500. This means of itself a very substantial town and as other industries are bound to follow in the natural course of events, Baltimore, Hillsboro and other centres of Albert should flourish within the next few years. That the men behind the scheme have every confidence in it goes without saying. Senator Domville and Col. F.V. Wedderburn who have stayed with the proposal through fair and ill report deserve everything that they may get from the undertaking. The Record's information concerning the closing of the deal comes direct from London and through an independent source but it is further understood that the engineer sent out by the company to examine the prospect is delighted with what he has seen. The Record is assured that 'unless the sky should drop, the enterprise will be carried out,' along the lines suggested in another part of this issue. This is good news for the province of New Brunswick and is another indication of the way the wind is blowing."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Dec. 9, 1910 and Granite Town Greetings - Dec. 16, 1910 Albert Shales to be Developed by Great Company. - œ1,000,000 Back of Enterprise and $3,000,000 will be Expended in Plant and Equipment. - New Industry will Mean the Employment of Thousands of Hands - Shales Among Richest in World. - The Record is in a position to announce one of the biggest deals that has gone through for years in connection with the development of New Brunswick a few days

ago, the Record was advised by a London firm that a company had been formed to develop the Albert Shale deposits. This announcement was withheld until such time as more definite news was received. Now it may be announced with every possible assurance that the money to develop these rich oil deposits will be forthcoming and that within the next few months work of preparing the ground for the mammoth works that will be necessary will have been begun. The shales to be handled by the new company have been in the hands of Senator Domville, Col. E.V. Wedderburn and associates for some months. A short time ago the present owners closed their options and paid for their properties, which are held under original land grants carrying mineral rights and work of placing the property on a working basis was at once commenced. For months the shales of Albert County had been attracting attention from foreign capitalists and the representatives of some of the biggest oil companies in Great Britain and the United States sent their engineers to Albert to look over the property. Offers of all kinds came to hand to finance the undertaking but the owners decided that it would be in the best interests of all concerned to place their holdings direct and in such manner as would guarantee to the province the greatest return in actual investment, employment of labor, etc. This has been done by interesting some of the best known moneyed men in London in the scheme and more will be learned of the big undertaking in the very near future. Only last week, J.C.S. McKenzie, one of the foremost consulting engineers of Great Britain went over the property and it is understood that he was very favorably impressed with the possibilities of the fields and pronounced them as among the richest of the kind in the world. When it is recalled that Dr. R.W. Ellis, of the Geological Survey, after a close examination of the property and a thorough test of the oil bearing shales, conducted in Scotland under the direction of experts, declared the deposits to be twice as rich in oils and sulphate of ammonia as the shales of Scotland, he at once concentrated the attention of oil magnates on the Albert fields. The findings of Dr. Ellis were verified by others and it became patent that for some years there has been lying dormant a wealth that can only be estimated in many figures. Since that time company after company has sent its agents to the fields at Baltimore and now it would appear that unless the sky drops, or something else of a remarkable nature happens the big venture will be under way before the snow again flies. Oil has been taken from shales for years in Scotland at great profit to the operators. These shales show far less richness in oils and fertilizers than those of Albert but they have paid the owners fabulous dividends. Among the greatest of these reduction works are those at Broxburn and Pumpherton. The plants cover acres of ground and give employment to thousands of hands. The oil is produced at a figure that makes it a strong competing force against the oil wells of the United States and other parts of the world. In Albert the cost of production will be distributed over more gallons per ton of shale and by-products, including a very heavy percentage of ammonia, one of the most valuable fertilizers known and one that is very rich in nitrogen. With a world wide demand for oil for fuel purposes, and this call for oil fuel is increasing, the total production of the Albert fields will be as a drop in a bucket. The market for the output of the entire shale fields is right at hand and this of course will be one of the strongest features in the ultimate success of the venture. The shales of Albert and Kings are very considerable in extent. They can be traced from Hillsboro to Norton and the oil indicated at Memramcook across the estuary of the Petitcodiac river is clearly the resultant of the same geological conditions that fixed the shales now available throughout this section. Once it is demonstrated that there is profit in extracting and refining shale oils, there should be even greater investments along the same lines. The company which has been formed in London to handle the initial venture into separating the oils from the shales is a very strong one. The capital stock is œ1,000,000 Sterling and of this vast sum no less than $3,000,000 will be spent on initial plant, etc. Some time ago representatives of United States refiners came to Albert and after looking over the ground offered to erect and equip refineries to handle the crude oil. This offer, however, will not be accepted. The company now formed will do all the work itself. Not only will it take oil from the rock but it will treat it until it goes on the market, either as fuel or finished product. The company also has in view the building of a railway from Hillsboro to Moncton, which it will own and control. The idea is to equip this road in every way suitable for the particular business for which it will be used. It will be first of all an oil road and will also be able to handle with expedition the output of the refineries. The work of producing oil on the scale contemplated vy the big company will mean the employment of thousands of hands. The erection of the plant itself will be an undertaking of vast magnitude and it will mean the expenditure of millions for labour and material. Those who have worked so energetically to bring about the present conditions, Senator Domville and Col. Wedderburn, deserve every credit for their enterprise. They have had many difficulties to overcome and it was only their unbounded faith in the enterprise that kept them working away during the past three years. Now that the project is in definite and almost certain shape, the following reference to the shale deposits, published some years ago in the New York Engineering and Mining Journal will be of interest: The importance of these large deposits of fuel oil, has been appreciated by far-sighted people, for these shales virtually present an undertaking in which means a barrel of oil for each ton of shale raised. The byproduct ammonium sulphate, not taken into account in the early days, will more than bear all the expense of mining and treatment, and the oil product is not governed by the fortuitous discovery of an oil reservoir by boring and the sure exhaustion of the well if it is originally productive. There are deposits of shales in the United States which, under proper supervision, may also prove to be valuable properties. Oil shales occur on the Humboldt river, opposite to Elko, Nev.; on the Big Blackfoot river and near Great Falls, Mont.; and in the Chalame valley, north of Parkfield, Cal. The crude oil produced by retorting the New Brunswick shales is essentially the same as petroleum of the Mid-Continent field; therefore the same markets are open for it, as an article of commerce, it must be considered primarily as a liquid fuel. In this connection, it may be stated that during 1907, a total of 18,866,691 bbl. of oil were consumed as fuel by the railroads of the United States, as against a total of 15,577,677 bbl. in 1906. The estimated length of railroad line operated by the use of oil fuel in 1907 was 13,593 miles, and the total length of line covered by oil- burning engines has been estimated as 74,197,144 miles. Most of the oil consumed was crude oil, the remainder being residuum from the refineries. Practically all the oil was from the Mid-Continent, Gulf, and the California fields. Being cheap and developing great heat on combustion, oil (particularly crude oil) is largely used as a fuel in various industrial plants, especially metallurgical plants. Liquid fuel is decidedly an economical fuel. It occupies less space than coal, it has greater efficiency of evaporation per unit measure of heating surface, more equable generation of steam, greater cleanliness and freedom from ash, avoidance of loss of heat by frequent opening of furnace doors, and instantaneous extinction of furnace fires. According to the report of the United States liquid fuel board in 1904, the following additional advantages were found to be practically obtainable; ease in filling tanks, rapidity of time in meeting a varying load on boiler, ability to force boiler to extreme duty in case of emergency, absence of smoke under light normal working conditions, short height of stack, superior personnel available for the operation of the burners, and ability to secure and maintain higher speed with oil than with coal. It should also be noted that in practice one ton of fuel oil is equal in thermal efficiency to about one ton and three-quarters of steam coal. Although as above stated, liquid fuel is largely applied in metallurgical operations, in which applications the employment is decidedly advantageous, yet it has been impossible to secure adequate supplies of liquid fuel for general employment. In this connection it may be said that Redwood pointed out in evidence before the royal commission on coal supplies in 1903, that 'even if the whole of the world's output of petroleum were doubled, and the surplus thus created were used as fuel, this surplus would, taking into account the relative thermal efficiencies, only be equivalent to about 5 per cent. of the world's output of coal. Crude oil is especially advantageous to use as a fuel on shipboard, or locomotives, and in stationary boilers. For some time the British Admiralty has been fully alive to the importance of using liquid fuel and remarkable results have been obtained in the smaller vessels. In the British navy, no oil with a flash point below 93.3 deg. C. is allowed on board, although in the German navy and the mercantile marine the limit is fixed at 65.5 deg. C. It is reported on good authority that some of the

St. Andrews Beacon - Dec. 15, 1910 It is announced that the Albert County shale tract has been sold to English capitalists who have formed a company with a million pounds capital stock and will extract the oils from the shale."

Evening Times & Star - Jul. 21, 1910 Our Oil Shales. - A dominion government publication says:- 'The oil shale industry of Scotland has been in existence for the last sixty years, has successfully withstood competition from the Russian and American crude oil industries, and the dividends for the last few years have been very satisfactory; those of the four refining companies for the last year for which there are returns being 7, 15, 17«, and 50 per cent, respectively. The men employed number 8,300, including 4,000 miners; and the wages paid annually amount to about 3,500,000. It is not the oil content of the shales alone that makes them valuable; but it is the by-products - particularly sulphate of ammonia - that render the industry so profitable.' The New Brunswick shales, a shown in a government report, compare favorably with the Scottish; many of the samples running far higher in oil and sulphate of ammonia than those profitably exploited in

Moncton Daily Times - Mar. 22, 1910 New Brunswick Oil Shales. - A report on the bituminous or oil shales of New Brunswick and Nova Scotia will have great interest for the people of Albert county, where these shales are largely found. This report, prepared by Mr. R.W. Ells and issued by the Department of Mines, suggests the possibility of a considerable industrial development in connection with a natural resource about which not much is known. Mineral oil, says the Montreal Gazette, is an article of growing commercial consumption for new purposes as well as old. It is in increasing demand for fuel as well as for lighting and mechanical purposes. Locomotives in the south use it instead of coal. Recent British newspapers tell of Admiralty purchases of Scottish mineral oil, a heavy paraffin product, for naval use. Some of the newer torpedo craft have their furnaces arranged for the burning of oil as well as of coal, and the protected cruiser Bristol is to have her furnaces adapted for the consumption of both coal and oil. The advantages of liquid fuel on a steamship are important. In the first place one ton of oil gives the same result in steam production, it is estimated, as two tons of coal. In the second place the oil is more easily handled than coal. There is, therefore, likely to be a good demand for oil of suitable quality that can be produced. The Scottish companies give from 150,000 to 200,000 tons a year, and as the potential consumption of the British ... [much missing] ... Quite a good results were obtained by Mr. W.A. ..?.., in the laboratories of the College of the City of New York, who made analysis of eight samples from different deposits, while even better things were recorded in connection with the test of four samples at the laboratory of the Department of Mines, Ottawa, one from Albert, showing at the rate of 112 gallons of oil to the ton. Taking the Scottish test it is found that the shale treated yielded values of $4.15 a ton, the estimated cost of getting out and treatment being $1.86 a ton. This is promising. If there are workable deposits of size sufficient to warrant the outlay for the erection of plant, etc., there should be no difficulty in getting capital for the enterprise. The Nova Scotia shales do not appear to be so promising as those of New Brunswick. Much that is interesting is told about them however, as about the industry generally and the origin and basis of its operations. The report should serve to draw the attention to what appears to offer a good opportunity to men of enterprise and capital."

Evening Times & Star - Oct. 20, 1910 The Albert Shakes. - Moncton, Oct. 19 - (special) - James E. Calhoun, owner of the shale property in Albert county, accompanied by G.E. Stringer, an english mining engineer, and J. McSweeney, mining engineer of New York, were in the city today on their return from Albert, where they have been some days making a thorough inspection of the shale properties. Mr. Stringer said that previous reports of engineers on the property had not been exaggerated. He found the shale seams thicker and the quality better than the shales in Scotland. The party left this

Daily Telegraph - Oct. 20, 1910 English Engineer Pleased With Albert Shales Prospect. - Moncton, Oct. 19 - (Special) -

James E. Calhoun, owner of the shale property in Albert county, accompanied by G.E. Stringer, an English mining engineer, and J. McSweeney, mining engineer of New York, were in the city today on their return from Albert, where they have been some days making a thorough inspection of the shale properties. Mr. Stringer said that previous reports of engineers on the property had not been exaggerated. He found the shale seams thicker and the quality better than the shales in Scotland. the party left this afternoon for New York."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Oct. 21, 1910 Albert Shales all Right. - Moncton, October 19. - James E. Calhoun, owner of the shale property in Albert County, accompanied by G.E. Stringer, an English mining engineer, and J. McSweeney, mining engineer of New York, were in the city today on their return from Albert where they have been some days making a thorough inspection of the shale properties. Mr. Stringer said that previous reports of engineers on the property had not been exaggerated. He found the shale seams thicker and the quality better than the shales in Scotland. The party left this

Evening Times-Star - Sep. 15, 1910 and Daily Telegraph - Sep. 16, 1910 Albert county Shale; Capitalists Inspect. - The shale deposits of Albert County are attracting wide attention. Two separate parties, one from the United States and the other from Great Britain, are now in the county looking over the various deposits with the object of acquiring working rights if everything turns out satisfactorily."

Evening Times & Star - Sep. 27, 1910 The Albert Oil Shales. - The news of the proposed development of Albert county oil shales by English and American companies is significant of the general movement to develop the natural resources of this province. The Times-Star some months ago quoted from the government reports to show that the oil shales of Albert, tested in Scotland, yielded better results than the Scotch shales, which are the basis of a profitable industry employing thousands of work people. The oil shales at Albert are to be developed by an English company, and an American company offers to take and refine their whole product. It is possible that the refinery may be located at St. John, although Hillsboro is also mentioned. With the development of oil and gas wells, and the very extensive oil shales, the county of Albert appears to be on the eve of an era of industrial growth that will have a very stimulating effect upon some other counties, and especially those centres within easy reach of the oil and gas supplies."

Campbellton Graphic - Sep. 30, 1910 Big Development in Albert. - Capital Has Been Raised For The Operation Of Big Oil Works. - Albert County will have a big boom in its oil fields. That has already been definitely decided. Last week a party of United States oil men looked over the property and as a result of what they saw, are prepared to undertake to erect a large oil refinery with which to treat crude oils extracted from the Albert shales. This week Senator Domville leaves for England to close the end of a deal by which capital will be provided for the establishment of works for the extraction of crude oil from the rock. That this will be forthcoming is pretty well assured and it will probably only be a matter of a few months when several thousand men will be employed on the oil rock of the county. There are good markets in sight and lots of interest in deposits which are now recognized to be among the most valuable of the kind in the world. The possibilities of the Albert oil fields are almost without limit and the discovery of gas will tend to materially aid in the development of the rich properties. Oil is in great demand as a fuel in all parts of the world and the supply in Albert and Kings counties is almost inexhaustible. The development of these properties is another link in the big chain of development that is due in New Brunswick. The task of securing capital to operate the Albert fields has been a difficult one. Many difficulties have had to be overcome. The proposition was knocked and knocked until Mr. Ellis, of the Geological Survey, took the matter in hand and discovered that the shale deposits were of great value. Then followed his trip to Scotland, where he personally matched the tests made on the shale. His report on his return home was all that could be desired. Dr. Ellis found the shales to be richer than those of Scotland, which have won fortunes for their owners, and from that time forward it was only a question of time when the proposal could be floated. Now it is in good shape, despite the knockers and big things are expected from the operations which are bound to follow. Not only are there great deposits of oil in the county but the gas flow from the wells opened so far will supply the wants of the entire province from Moncton to St. John, and still leave millions of cubic feet of gas to be disposed of. The people of New Brunswick have as yet a scant conception of the importance of the work that has already been done in Albert. It will revolutionize the whole section of the country in time and will be the means of attracting to New Brunswick a great population. The owners of the gas wells are already considering plans for the piping of the gas to St. John and intermediate points. Moncton will first receive attention and gas pipes will be laid to that city in a short time."

Daily Gleaner - Dec. 11, 1911 The Oil Shales. - Mr. Matthew Lodge, of Moncton, Tells of Sale to Sir William McKenzie. - Moncton, Dec. 10. - Natural gas will be turned on for city users tomorrow or Tuesday, according to present plans. The company will also use the gas under their boilers at the electric light and street railway plants. Traffic on the street railway has been beyond all expectations. Matthew Lodge, the Moncton man, indicated in a St. John evening paper as having received $90,000 for his interest in the Albert shale property, when seen by the Standard correspondent tonight, said that negotiations had been concluded with Sir William MacKenzie in Toronto on the 23rd of November last and that work is now being carried on by prominent engineers employed by the present associated interests. A shaft is being sunk at Rosevale, Albert county on the property of Samuel Steeves. The work is in charge of J.M. McQueen, of Sydney, and the shaft will be sunk 330 feet and the veins then crosscut under the mountain, both east and west. Mr. Lodge said nothing definite concerning the plant would be done until Sir William and his associates had completed their arrangements but it was in contemplation to erect a retorting and distilling plant such as used in the Scottish shale areas to secure the oil as well as the sulphate of ammonia and other by- products. Mr. Lodge said Gerard G. Ruel, attorney for the Canadian Northern and Sir William and himself had met the New Brunswick government on Dec. 1st, and the government was to be congratulated for their determination on a forward policy compelling the working of these deposits. The shale areas now controlled by Sir William and associates consist of 192 square miles extending from Taylor Village and Belliveau's in Westmorland Co., across the country through Albert to Cardwell on the borders of Kings and reported to be unequalled in quality and quantity in any part of the world. Mr. Lodge has been working on the development of these shales for the last 14 years, but says this is the first time in their history that they have been in the hands of men financially able to secure the best results."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
S.J. Globe - Dec. 11, 1911 Albert Oil Shale Development Work. - Mr. M. Lodge Tells of Sir Wm. MacKenzie's Plans. - Mr. Matthew Lodge, of Moncton, who is reported to have received $90,000 for his interest in the Albert shale property, admits that the deal has been concluded with Sir William MacKenzie, as told exclusively in the Globe on Saturday. A shaft is being sunk at Rosevale, Albert county, on the property of Samuel Steeves. The work is in charge of J.M. McQueen, of Sydney, and the shaft will be sunk 330 feet and the veins then crosscut under the mountain, both east and west. Mr. Lodge said nothing definite concerning the plant would be done until Sir William and his associates had completed their arrangements, but it was in contemplation to erect a retorting and distilling plant such as used in the Scottish shale areas to secure the oil as well as the sulphate of ammonia and other byproducts. Mr. Lodge said Gerard G. Ruel, attorney for the Canadian Northern, and Sir William and himself had met the New Brunswick government on Dec. 1st, and the government was to be congratulated for their determination on a forward policy in compelling the working of these deposits. The shale areas now controlled by Sir William and associates consist of 192 square miles, extending from Taylor Village and Belliveau's, in Westmorland county, across the country through Albert to Cardwell on the borders of Kings, and reported to be unequalled in quality and quantity in any part of the world. Mr. Lodge has been working on the development of these shales for the past fourteen years, but says this is the first time in their history that they have been in the hands of men financially able to secure the best results."

Kings County Record - Dec. 22, 1911 A Greater Albert County. - The purchase of the shale deposits by the Mackenzie and Mann interests marks many milestones in the future prosperity of Albert County. The oil shales there are pronounced by experts to be among the richest in the world and now that crude oil is becoming such an important factor in the development of power on the large ocean going vessels, new sources of supply are being very eagerly sought for. The magnitude of the works required for the reduction of oil from the shale is hardly appreciated, with the initial plant on a scale as already suggested, there will be employment given to over 3,000 men. Then will come the subsidiary plants with their call for more help and in addition there is every prospect that a second company will be formed. This one industry will mean thousands of additional population for this constituency and Kings County will of course derive lasting benefits from the development of the resources of Albert. The present owners of the property have a world-wide reputation as business men whose deeds speak louder and oftener than their words."

Weekly Record - Jul. 9, 1911 The rumor of development of the Albert County shales has again been revived. This time it is expected that the Calhoun deposits will be worked by an English company with whom Premier Hazen has been treating in London. The shales have been pronounced of a richness that will make millions for those who undertake to their development, but for some reason or other, the thing seems to be standing still. It is to be hoped for the prosperity that is bound to follow to Albert county that a deal has been arranged."

S.J. Globe - Nov. 9, 1911 Albert County Development. - A meeting of the directors of the Albertite Oilite and Cannel Coal Co. Ltd. is being held this afternoon in the offices of Messrs. Weldon & McLean, Col. John C. Calhoun, of New York, who is actively interested in the development of the Albert county oil fields, is in attendance."

Daily Gleaner - Jan. 23, 1912 N.B. Prospects. - ... Sir William MacKenzie has purchased the great shale area lying in Albert county, which is considered by experts to be equal to the Scotch shales. An English syndicate is developing the natural gas and oilfield near the city of Moncton. Already over 20 wells have been bored, giving an output of over 60,000,000 cubic feet of gas per day. This is now being piped into the city of Moncton, and it is expected that arrangements will soon be made to lay piping into the manufacturing city of Amherst, to Sussex and to St. John."

S.J. Globe - Mar. 2, 1912 Development of Albert Oil Shales. - Mackenzie and Mann Taking Preliminary Steps. - Options Not Yet Closed. - Local Government Will Build Some New Bridges - Fredericton, N.B., March 2. - G. Gerald Ruel, chief solicitor for Mackenzie & Mann and the Canadian Northern Railway, was here yesterday and had a conference with Premier Fleming, and made the first move towards the securing of legislation for Sir William Mackenzie's syndicate to proceed with their proposition for the development work of the oil shales of Albert county. The company will be known as New Brunswick Oil Shales, Limited, and will have an authorized capitalization of $5,000,000. As to the plans for proceeding with the development work, Mr. Ruel had no information to give. He said that as soon as the snow left the ground, a more complete investigation would be made by the engineers and experts, but that as yet the options which Sir William

Mackenzie has taken on the properties had not been closed, although they probably would be early in the spring."

S.J. Globe - Mar. 2, 1912 ADVERTISEMENT: New Brunswick Shales Ltd. Notice is hereby given that an application will be made to the Legislative Assembly at its next session for an Act to Incorporate the New Brunswick Shales, Limited, with a capitalization of five million dollars, with power, amongst other things, to carry on general mining undertakings in the province, to acquire lands, leases, licenses and concessions, to erect mills and plant, and carry on all business incidental thereto, also, with the approval of the Lieutenant- Governor-in-Council, to expropriate lands and interests in lands for the purposes of its undertaking, to construct lines of railway connecting the properties of the Company with the Intercolonial Railway, or the water front, and with other usual and customary powers; the head office of the Company to be at the city of St. John or elsewhere within the province. Inches & Hazen, Solicitors for Applicants. St. John, N.B., March 1, 1912."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - May 15, 1912 ADVERTISEMENT: New Brunswick Shales Limited. -- Notice is hereby given that an application will be made to the Legislative Assembly at its next session for an act to incorporate the New Brunswick Shales Limited, with a capitalization of five million dollars, with power amongst other things to carry on general mining undertakings in the province, to acquire lands, leases, licenses and concessions, to erect mills and plants and carry on all business incidental thereto, also with the approval of the Lieutenant Governor in Council to expropriate lands and interests in lands for the purpose of its undertakings to construct lines of railway connecting the properties of the Company with the Intercolonial Railway, or the water front, and with other usual and customary powers; the head office of the Company to be at the City of St. John or elsewhere within the province. Kings County Record - May 15, 1912 ADVERTISEMENT: The General Oil Shales Company of Canada, Limited. Notice is hereby given that the annual meeting of the stockholders of The General Oil Shales Company of Canada, Limited, for the election of Directors, and for the transaction of such other business as may be brought before the meeting, will be held at the head office of the Company, at Rothesay, New Brunswick, on Monday, the Twenty-Ninth day of April, at the hour of three o'clock in the afternoon. Robinson"

Kings County Record - Dec. 12, 1913 Eight Million Dollar Company. - Reported Formed to Develop Oil Shales in New Brunswick. - There is a rumor in Halifax of the formation of an eight million dollar company to develop oil shales in New Brunswick. So far as can be learned locally, there is nothing in the report. It is understood, however, that Canadian parties who have been in London in connection with shale properties in which Senator Domville is interested have reported progress and will return to this country shortly. It is also noted that the private car Atikokan, of the Canadian Northern Railway, reached St. John Monday, attached to the Atlantic Express. The car was brought to St. John to meet Sir Wm. Mackenzie, who was expected in the city on the steamer Royal George, due there late Wednesday night or Thursday morning. Sir William is interested in the development of Albert County shales but it is not known that his business in England had any significance in this connection."

Kings County Record - Nov. 28, 1913 The Rich Oil Shales of the Provinces. - Canada's present contribution to oil production is seen by the returns to be a mere bagatelle, says the Montreal Star. With us it is not a question of what we are producing, but what resources we possess. Our record for some years has been one of decline; but fortunately there is no promise of future development. Our production reached its highest point in 1907, when it aggregated 788,872 barrels of thirty-five gallons each. In 1911 the corresponding figures were only 291,092 barrels. In the same year, 1911, we imported 71,553,251 gallons of crude oil and 45,000,000 gallons of its manufactured products. The question for the future is, what are our resources; and considerable light is shed on this by an advanced report of their investigations made by Messrs. Frederick G. Clapp and L.G. Huntly of the Mines Branch. The chief contributor to present production is the western Ontario field, which is being gradually exhausted. The only other source is New Brunswick, where the oil shale industry is in its infancy. In 1911 New Brunswick's output was 86,139 gallons, which had grown from only 3,328 as recently as 1901. These oil shale deposits, which are situated in Albert and Westmorland counties, are extensive and rich. Five years ago thirty-six tons f this shale was shipped to Scotland and there tested in an experimental retort at the Pumpherston works. The yield of crude oil per ton ran from 34 to 45 gallons with 71 to 100 pounds of sulphate of ammonia. This showing is very favorable, for the Scotch shale now seldom runs over 30 gallons of crude oil to the ton. Put into commercial language, the New Brunswick shales show a yield of $3.00 a ton up without bonus, or $3.50 with bonus, against a cost of $1.86 to the ton for mining and manufacture. In Scotland at present the cost of mining and manufacturing is abut $2; and the net profits are only about 80 cents. As a result of this experiment, a commercial plant is being put in with a capacity of 80,000 gallons of crude oil per day. These oil shales of New Brunswick are the only deposits of the kind which have been thoroughly investigated; but rich shale of varying character is known to exist in a number of other provinces, Pictou and Antigonish Counties Nova Scotia, particular has extensive deposits of this mineral which have been partially exploited for a number of years. It is found usually in conjunction with the coal fields and has been used chiefly in the production of gas."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Oct. 31, 1913 Big Deal Closed in Albert Oil Shales. - Company Controlled by Senator Domville, Col. F.V. Wedderburn and Others Taken Over by English Capitalists. Property Estimated to be Worth $80,000,000. - That the purchasers, English capitalists of large means, have taken over the Albert shales controlled by Senator Domville, Col.

F.V. Wedderburn and others, and have made the initial payment on the bargain, is the announcement which is now definitely made. The property has been under investigation by 'big people' for several years and a number of the world's foremost oil experts have thoroughly examined the deposits. That the property is worth $80,000,000 is the almost startling estimate of the worth of the shales, which have been lying undeveloped for many years. The company which will control the future of the workings intend to at once enter upon the preliminary development and this fall considerable work will be carried on in preparation for the erection of a mammoth plant, which will give employment to an army, variously estimated at from 2,500 to 3,000 men. This big body of employees will be engaged on the work of extracting the oil from the shales but additional hundreds will eventually find employment in the subsidiary industries which are bound to spring up. Baltimore, Albert county, is the nearest settlement to the scene of the future operations of the promoters of the extensive industries which it is proposed to establish and the population of Albert is bound to grow at an amazing rate within the next few years, if the present plans under construction are followed. The process of extracting oil from shales is not a new one. In Scotland there are large plants engaged in this work and it is such a profitable character that dividends of 100 per cent are not uncommon. The shales of Albert County have been pronounced richer than those treated by the Scottish companies, both in oils and the principal byeproduct, sulphate of ammonia, valuable as a fertilizer. In addition to these bulky lines, there the hundred and one other byeproducts which are common to every oil field. It is one of the biggest things announced in New Brunswick in years. Besides the property, which has been owned by the New Brunswick Oil Shales, Limited, there is the holdings of MacKenzie and Mann, from which more will be doubtless be heard in the near future. What benefits Albert county, must of necessity have a decided effect for the best for Kings, and the good news will be heard with pleasure on all sides."

Kings County Record - Jul. 3, 1914 English Expert Looks Over Shale Fields. - Mr. S. Lamb, of Manchester, England, spent Friday last in Sussex and vicinity looking into the shale outlook from Wards Creek to Apohaqui. Mr. Lamb is one of the gentlemen interested financially in the Syndicate that has taken over the ore and are now preparing to commence the exploitation of same on arrival of the mining engineer from London who is shortly expected on this side. Apart from the shale Mr. Lamb was much impressed with this portion of New Brunswick as an agricultural and mining section. He was very much pleased with its looks leaving here on Saturday morning for New York from which city he left for England on Wednesday of this week."

Kings County Record - Jun. 19, 1914 Oil Shale Development. - While in the past two years, or so, much has been said in the press about the proposed oil shale development of Albert and Westmorland, but as yet no actual start has been made on the premises. We are glad to ba able to say that a quiet effort has been in progress for over eighteen months to induce British capitalists to look into oil shale areas in Kings County and right at our own door. The area spoken of extends from Wards Creek to Apohaqui and a deal has been made, whereby the territory will be thoroughly examined by a mining engineer from London, who will probably be in Sussex by the middle of July next to supervise he operations. If the examination proves as good as outcropping appearances now denote, we would not be surprised to see, in the near future a plant erected along the area, that will mean much for Kings County. The presence of Albertite coal in this block, seems also highly probable. If this should be correct it would prove a very important factor in increasing the value of the area. Some St. John gentlemen are interested in this movement and feel very well satisfied that their hopes are well founded. At any rate a systematic search is now to be made which we trust, will prove entirely satisfactory. The promotion of this matter has been in the hands of E.A. Charters, of this place, who is very confident that there is an immense body of valuable oil shale on this area awaiting development."

Kings County Record - Mar. 27, 1914 Will Start Development of Oil Shales. - Work to Commence at the Oil Shales in Albert Co., That Have Been Lying Undeveloped for Years, the Estimated Value of Which is $80,000,000. - W.S. Calvert, ex-M.P., Ottawa, a member of the syndicate of British and Canadian capitalists interested in the development of the oil shales in Albert County, was in St. John last week to close up some final negotiation. In an interview he said the details of development could not be given out as yet, but it looked as if the plans of the syndicate would be of very great importance to St. John, as oil and gas could be brought to that city by pipe lines. He spent two weeks on the property, in company with expert engineers and is convinced of the great value of the deposits. Mr. Calvert added that a definite announcement regarding the development of the property would be made in a short time. This is the property in which Senator Domville is interested, and which he has brought to the attention of British capitalists. This shale property, which has been lying undeveloped for years, is estimated to be worth about $80,000,000. The process of extracting oil from shales has been carried on in Scotland, where big plants are engaged in this work, and the companies controlling them pay very large dividends. The shales in Albert Co. have been pronounced by experts to be richer than those treated by the Scottish companies, both in oils and the principal by-products, sulphate of ammonia, valuable as a fertilizer. In addition to these bulky lines, there are a hundred and one other by-products, which are common to every oil field. The company who control the future workings of the great property, contemplate the erection of a mammoth plant, which will give employment to thousands of men. What benefits Albert county must of necessity have beneficial effect on Kings and it will be good news to know that the development work will without doubt, start during the coming summer."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Dec. 24, 1920 Albert County Shale Development Soon. - Hopewell Hill. - The much talked of

Baltimore shale is now attracting very considerable attention and according to reports from that section, there is good prospect of considerable exploitation developing in the near future. That plans for carrying on operations have reached a concrete form is shown by the fact that a contract has been let for the erection of a building to contain a crushing and refining plant, the contractors being Archie Steeves and C.W. Dobson, of Moncton, former Albert County men. It is understood a plant is to be installed within the near future, and a thorough testing of the deposit made from a commercial standpoint. It has long been established by chemical tests that the Baltimore shale is of very superior quality, and there appears to be some reason at the present time for the presumption that a big industry may develop soon."

Kings County Record - Aug. 19, 1921Oil Shales Development to be Carried On. - Albert County Oil Shales Will be Expanded and Present Outlook is Most Promising. - Promoters Are More Hopeful Than Ever. - One of the principals interested in the development of the Albert County oil shales, recently informed the Record that the present outlook is the most promising since development of these wonderful oil bearing rocks was undertaken some years ago. Possibly no business proposition in which New Brunswick is interested holds more in store for the people of this Province than the successful establishment of the oil extraction industry. Of the value of these deposits there is no question. Years ago the late Prof. Ells conducted an exhaustive survey of the oil shale deposits and later made a trip to Scotland, where he personally examined deposits of that country and familiarized himself with the methods of extracting oil. Prof. Ells gave much time to the work and brought to bear upon it the geological experience of many years. His research made him a most enthusiastic supporter of any reasonable proposition to place Albert oil on the market. It was one of those propositions in which he took particular delight and his reports were favorable in support of the contention that a profitable enterprise would be established in Albert county capable of giving employment to many hundreds of hands. Mr. Matthew Lodge, Lieut. Gov. Pugsley, the late Senator Domville, the late Col. F.V. Wedderburn and their associates have never lost faith in the possibilities of this magnificent oil deposit. So strong is their faith in the project that an experimental extraction plant has been established near Baltimore and it is understood that the results obtained have been most encouraging. Behind the enterprise is a large British syndicate capable of fully developing the property once they are convinced that there are commercial possibilities in the field. Few people realize how extensive an undertaking is required to fully develop a property of this nature. Beside the oil itself sulphate of ammonia and other byproducts can be extracted in large quantities. Sulphate of ammonia is a valuable fertilizer and is largely used in the manufacture of mixed fertilizers and for home mixing. It is rich in nitrates and its production in New Brunswick in large quantities and at reasonable prices would tend to largely displace nitrate of soda which is brought to this country in large quantities from Chili. In addition to sulphate of ammonia the wide range of byproducts common to every oil field would be produced and eventually employment would be given to thousands of persons either on a site in Albert County or at some other point in the Province. Then there would be a refining of the oils which would in itself necessitate the erection of a plant capable of employing men by the hundreds. A plant suitable for the needs of this development of the Albert shales would cost many millions of dollars. Its erection alone would be a big thing for the province, and would result in the distribution of very large sums of foreign capital. Once it was erected there would be permanent employment for many thousands of men and the Counties of Albert, Westmorland and Kings would benefit directly from the erection of the city necessary to care for the proper operation of such an enterprise. Present indications are that sufficient has been determined in the way of fixing the possibilities on a profitable operation to make the prediction that New Brunswick will very shortly have established such oil extraction and oil refining plants as have been the dream of the promoters for a long period. The Record has always believed that the future of New Brunswick is assured and all that is necessary is to convince the investing public that money is to be made out of our natural resources. This that is being done in the case of the oil shales is most encouraging. The men who are backing the investment of this big proposition are among the foremost financiers of Great Britain. If New Brunswick could demonstrate to them that there is vast profitable wells in this province eventually results will be beyond the dream of our present generations. To those who have stood behind the enterprise for so many years, too much credit cannot be given. They have met with many discouragements. The intervention of the world war put back any idea of development for many years, but this did not altogether discourage them and today they are farther ahead than ever before in their plans in connection with this great work. How soon a permanent plant may make its appearance in Albert County is a question which is nearer solution than ever before. Never before has there been such enthusiasm among the promoters as to the ultimate successful outcome of their negotiations. Albert shales will mean much to New Brunswick if that confidence is well

Kings County Record - Jan. 28, 1921 Important Development in Albert County Shale Expected. - Reports from Baltimore, Albert county, indicate that talk of prospective work on a large scale in connection with the shale deposit there has not been exaggerated, and preparations are going on rapidly for installation of extensive machinery with which to prosecute the work. The buildings for housing the plant are nearing completion and the boilers are on the ground. The plant itself, including the retorts, etc., used for extracting the oil, has not yet arrived, but has been purchased and will soon be on its way. Electricity is to play a large part in the work and an extensive electrical plant will be installed. The company carrying on the work is the Anglo-Persian Shale Company, under charter from the British Government. The idea, it is understood, is not to refine, but to mine the shale and extract the crude oil which will be used for fuel by British ships. It looks now as though a real big industry is likely to develop in Baltimore."

Kings County Record - Jun. 24, 1921 The Albert Oil Shales. - Dr. W.S. McAnn, of the Geographical Survey, Ottawa, yesterday in company with Matthew Lodge of this city, visited the oil shales of Albert county. They were also accompanied by Dr. Wallace, inventor of the Wallace process, Mr. Hume and Mr. Jennings, geologists of the D'Arcy Exploration Company. Dr. McAnn considers the experimental plant at Rosevale to be very up-to-date and complete and probably the largest experimental plant in the continent. Dr. McAnn will be in the Moncton area for the next three months making investigations regarding the quality of the oil shales and will report to his department at Ottawa.- Moncton

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Dec. 2, 1922 Transcript. - Some New York capitalists have interested themselves in the production of shale above Berry's Mills and between that place and Catamount. In addition valuable deposits of shale have been found in abundance near Indian Mountain and from that place towards Irishtown. Samples of the mineral have been tested and it is expected that the deposits near Moncton will be most profitable when they shall have been worked more

Kings County Record - Dec. 22, 1922 Important Oil Shale Development. - Valuable Deposits of Oil Shale in the Immediate Vicinity of Sussex May Prove a Bonanza. - New York Capitalists Have Been Looking Over The Properties. - In the immediate vicinity of Sussex there is said to be valuable deposits of oil shale that in the near future may prove a bonanza to the parties who have interested themselves in the properties as all indications point to important oil shale developments in the near future. It is understood that New York capitalists have interested themselves in the deposits near Sussex and also in other sections of Kings county. In St. John an experimental miniature plant for the production of oil from shale has been installed and is in operation at Pugsley's Garage, Chipman Hill, and has been producing crude oil from New Brunswick shale at the rate of about fifty gallons per day. By this process it is said oil can be produced at a very low cost. The process at St. John is very interesting. It consists of heating the shale to four hundred and fifty degrees F, at which temperature the fats in the shale are forced out in the form of vapor, which in turn is condensed in a special apparatus, and from this the oil is drawn off. A representative of a big gasoline corporation of Boston, visited St. John last week in connection with the establishment of a gasoline refining station, having a capacity of about 20 barrels per day. The gasoline will be refined from the crude oil, as produced from the shale, by the Hartman plant. At the present time it is said Canada uses all the oil she produces in a year in six days. This enforces the importation of oil for the other 359 days. In New Brunswick there are deposits amounting to billions of tons of oil shale from which oil can be extracted at the rate of from 50 to 80 gallons to the ton. New Brunswick can, at this rate, solve the oil problem of Canada, and at the same time be one of the richest provinces in Canada. The machine used in the demonstrations, in St. John, is an exact miniature of the large machine. The large machine is 100 times as big, and has a capacity 250 times as great as that of the one in operation there. The capacity of the machine in St. John is one ton per day, which with the grade of shale now being used turns out from fifty to fifty-five gallons of crude oil. Few people realize what an important undertaking it is to develop an oil shale property. Beside the oil itself, sulphate of ammonia and other byproducts can be extracted in large quantities. Sulphate of ammonia is a valuable fertilizer and is largely used in the manufacture of mixed fertilizers and home mixing. It is rich in nitrates and its production in New Brunswick in large quantities and at reasonable prices would tend to decrease very greatly its importation and bring increased prosperity to the province."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Mar. 24, 1922 Development of Oil Shales in Province. - Oil Shales Soon Needed to Supplement Diminishing Output of Oil Wells. - Committee Appointed in Senate to Report on Oil Shales in New Brunswick. A committee was appointed in the Senate of Canada last week, to report on the oil shales of New Brunswick. In New Brunswick, particularly in the counties of Albert and Kings, are without doubt, vast oil shales. There are those who hold to the belief that if the oil shales of this continent cannot be economically utilized for the production of petroleum, the outlook for the future is very bad, so far as industrial enterprise requiring petroleum and its byproducts are concerned. There are others who have given close attention to the diminishing production from the oil wells who declare there is no need to worry as petroleum in incalculable quantity, can be had from the shales which are abundant and rich in parts of the United States and in the provinces of New Brunswick and Nova Scotia. It may not be long until the vast and rich deposits of shale with which the province of New Brunswick has been endowed will be put to the purpose for which they were given her. New Brunswick oil shale will soon be needed to supplement the diminishing output of the oil wells. The following article, taken from the Boston Herald of a recent date, in connection with the matter will be read with interest. 'Petroleum production in the United States has reached its peak and probably will begin to decline within three years. Dr. Ralph McKee, professor of chemical engineering at Columbia University, declared in an address tonight before the Buffalo Engineering Society. There is no likelihood of the discovery of new petroleum fields in this country, Dr. McKee asserted. But, he declared, rich oil shale deposits, as yet practically untouched, are capable of supplying the nation's petroleum needs for hundreds of years. He predicted the extraction of oil from shale would become one of the greatest industries in the country. 'It is not commonly appreciated how large these shale deposits are,' he said. 'If we consider only those oil shales which will furnish a barrel or 42 gallons or better of petroleum per ton of shale, we have in the Green River section of Colorado, Utah and Wyoming alone sufficient to furnish 64,000,000,000 barrels of petroleum, which amount is eight times larger than the total of the well petroleum that this country has produced since Col. Drake drilled the first oil well in 1859 in Titusville, Pa. It is more than five times the total production of the world since well petroleum became commercial, 60 years ago. 'There are also large deposits in Nevada, California, Kentucky, Indiana, Ohio, New Brunswick and Nova Scotia, and smaller deposits, though large enough for commercial exploitation, in many other portions of this continent. There are similar deposits in other parts of the world. 'Of those deposits which are likely to be exploited in the next decade, we have variations in yield

from 20 gallons to 60 or even 80 gallons per ton. The large deposits of better grade will give about a barrel (42 gallons) of oil per ton of rock. 'A shale oil plant, to be successful,' he continued, 'must be able to handle cheaply and efficiently large quantities of oil shale, distilling it to get the crude oil and ammonia and then crack and refine the crude oil to get a commercial motor spirit.' Prof. McKee said more than a score of retorting scheme have been proposed by American inventors, but that 'at present few believe that any one of these retorts is certain to be practicable when used on a large scale. The ideal process will be one permitting continuous operations on a large scale with minimum labor and with the recovery of good yields of commercially valuable products. 'It is only within the last five years that serious attention has been given to the question of the development of a proper type of retorting still. We have no reason to think but that well before the same length of time will have elapsed, we will have succeeded in obtaining a retorting scheme which can handle with low labor costs, efficiently and economically, American oil shales. 'The demands for petroleum are increasing in this country at the rate of about 50,000,000 barrels a year. If this continues it will require each year 75 new plants, each handling 2,000 tons of oil shale a day and representing an investment of close to $1,000,000 each to give sufficient oil to meet this yearly increase in demands for petroleum. We have no other source of fuel oil or gasoline substitute in prospect which promises to furnish even a minor part of this demand. In other words, we have reason to look forward to utilization of oil shale as a profitable chemical manufacturing industry which will rank with our largest industries in its labor and capital

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Carleton Sentinel - Apr. 13, 1923 There are now three companies contemplating the erection of Hartman retorts and installing shale handling equipment in New Brunswick. What is meant by retorts and equipment is that the Hartman equipment is complete to dig the shale as it now lies in the mountains by the great machine which cuts its way underground and mines the shale at a fraction of the cost of labor. After this great automatic shale digger mines the shale it is sent by conveyors to the mass in high speed, self cleaning crushers. After this operation the shale passes to the intake traps of the retorts. After passing through the retorts the shale is reground and blown to the fire-box and the hydro-carbon left in the shale is burnt as fuel. Then the residue of the spent shale, after coming out of the firebox, is a high class fire-clay and conveyed to the spoil banks. The gases from these shales are taken from the retort and put through a condenser where petroleum and other by-products are removed from the gas. The permanent gases are used either as fuel for the retort or burnt into carbon black. After this petroleum is manufactured, it goes through a Hartman Low Pressure Topping Still. 40 per cent of the total contents of the petroleum is put into gasoline. The residue petroleum taken from the Topping Still is automatically fed into the Hartman High Pressure Cracking Process, which manufactures the larger volume of this heavy residue petroleum into gasoline. The total recovery of gasoline from shale petroleum is 80 per cent. Therefore the Hartman equipment is complete from the mountains of shale direct to gasoline with elimination of the usual million dollar refineries. The approximate cost to produce the petroleum from the shales in New Brunswick by the use of the entire Hartman system to turn it into gasoline should not exceed a total of one dollar ($1.00) per barrel. Therefore gasoline should be produced from the New Brunswick shale at a cost not to exceed seven cents ($0.07) per gallon. The retorting plants now contemplated for New Brunswick, with many others of course to follow, figure what three 1,000 ton plants mean to this province. These three 1,000 ton plants are sold by the Hartman Process Company on a guarantee to handle that many tons; but in reality will handle 2,000 tons; that would be 6,000 tons of shale per day. The average yield of the shales of New Brunswick is one barrel of petroleum per ton, which would be 6,000 barrels of petroleum per day, or approximately 200,000 gallons of gasoline per 24 hours. I fully expect and look forward to seeing at least 100 of these big retorting plants in operation in Canada within the next five years as the shales are here and petroleum is a necessity to every human being on this continent. The shales are very rich in petroleum and with the Hartman equipment they can be handled in a great, profitable commercial way to produce a tremendous amount of wealth to the Dominion of Canada. The opening of the Canadian shale industry means the dawn of the greatest commercial and substantial industry on this continent. With the perfection of the Hartman machinery it is one of the most substantial and profitable investments of the day; as the engineers can estimate the quantity and quality of the shales and estimating just what their annual dividends will be. They can know exactly what it costs to handle and treat a ton of shale and they know what the market value for petroleum is, and with fast diminishing oil fields on this continent it is not a matter of what we want to do, but it is what we have to do, as shale is the only known source to replace petroleum. The Hartman Process Company is truly a manufacturing Company, manufacturing the machinery and equipment for the handling of shale. We also know what our revenue will be from the operations of these machineries as they are all sold to the operators with a substantial royalty attached. Therefore, all possibility of a gamble in the shale business is eliminated. I expect to see hundreds of people coming to New Brunswick in the search for these shale lands as soon as the snow is off the ground, and I look to see great developments take place after these investigations. I cannot see anything but a tremendous future for the oil shale industry in Canada with the Hartman machinery properly installed and with sufficient capital to operate same. - E.W. Hartman"

St. Croix Courier - Apr. 26, 1923 The N.B. Oil Shale Deposits. - E.W. Hartman, president of the Hartman Process Company, is in the province at the present time. Mr. Hartman said that he was called here to confer with some of the oil shale proprietors of New Brunswick and Nova Scotia relative to placing Hartman machinery upon the oil shale deposits here. He added that he and his company are giving careful attention to plans that will mean the development of the shale oil industry of the Maritime Provinces upon sound business lines. These matters, he said, are in charge of Newcombe and Winchester, the Canadian representatives of the company, and he declared he would see that the ablest engineers at the disposal of the company will come here to supervise and give every possible assistance to open up the shale oil industry of the Maritime Provinces upon a commercial basis. The company, he said, is now completing all necessary patterns and getting the equipment in shape to be shipped to St. John for the manufacture of machines and retorts for the shale oil industry here. The exhaustive tests which had been made on the shales of the Maritime provinces, aggregating some twenty tons from all parts of Eastern Canada has proved beyond all doubt, he declared,the great commercial value of the shale oil deposits here operated upon by the Hartman Retort. The St. Stephen agents are Wm. Porter and A. Bennett."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Telegraph Journal - Jul. 30, 1923 Judgement for Plaintiff in the Oil Shales Case. - Order to be Given for Foreclosure of Mortgage Held by Trust Company - A $5,000,000 Bond Issue Involved - Proceedings Reviewed by Chief Justice Hazen. - Judgment was delivered on Saturday in Chancery by Chief Justice Sir Douglas Hazen in the case of the Prudential Trust Co., Ltd., against the Oil Shales Co. of Canada, Ltd., and by amendment the Prudential Trust Co. Ltd., versus the Oil Shales Co. of Canada Ltd., Edward Domville, Isabel Earle, the Finance Corporation of Canada, Ltd., the Hon. William Pugsley and the N.B. Real Estate Loan and Trust Co. Ltd. The chief justice decided that an order should be given for the foreclosure of the mortgage held by the Prudential Trust Co. Ltd against the defendant the Oil Shales Co., of Canada, Ltd. and that the mortgaged premises should be sold. Grounds For Action. - The action was brought at the request of Hon. William Pugsley, the only surviving executive officer and vice president of the Oil Shales Co. of Canada, Ltd., on the grounds that the mortgage should be foreclosed because all the covenants had been violated and that the company was insolvent. The other defendants who were joined to the suit opposed this, submitting affidavits to the affect that Mr. Pugsley wished to bring the property to sale in order that he might buy it in at a very low price and that if an order for foreclosure were made, the interests of Mrs. Earle, Mr. Domville and the others mentioned would be sacrificed. It was suggested that there was collusion between the plaintiff and Mr. Pugsley for the purpose of defeating the rights of the other defendants. The chief justice found that from the evidence submitted there was no fraud or collusion in which the Trust Company was a party in order to do injustice to the other parties interested, and he thought that the matter of the relations existing between Mr. Pugsley and the other members of the company, if taken up, should be done so in a subsequent suit for an accounting between them. Plaintiff's Claim. - The claim of the plaintiff, the Prudential Trust Co. Ltd., was as mortgagee in trust for the benefit of the holders of bonds issued by the defendants for the sum of $5,000,000, with interest at the rate of six per cent per annum. No interest was ever paid and the plaintiff claimed, in addition to the principal, for interest thereon from April 1, 1914, the date of the mortgage, until April 1, 1922, a sum amounting to $2,400,000 and for subsequent interest until paid. The lands and premises are all situated in the county of Albert and the transaction arose in connection with the attempted development of the oil shale properties on these lands, the object being to convert this shale into fuel oil. The directors of the company were authorized to borrow $5,000,000 and issue first mortgage bonds in sums of $500, each payable at the Bank of British North America, to be secured by a first mortgage upon the property to the Prudential Trust Co. Ltd. The sale of the authorized bonds was never made. It was contended, on behalf of the other defendants opposing Mr. Pugsley. that the oil shales company was not insolvent and that there had never been any issue of bonds and that the conveyances were made in order to enable the Oil Shales Co. of Canada Ltd., to issue and sell the bonds and for no other purpose. These purposes having failed, they alleged that they had a right to have their respective interests in the property reconveyed to them free from any encumberance of the plaintiffs. Sir Douglas found that if the mortgage were to be discharged and cancelled, as they requested there would be no security left for the debentures and the oil shales company would hold all the property free of any claim of the original owners and subject to all the unsecured liabilities, so that the security would be gone and the property placed in the hands of a bankrupt company. There was evidence that Mr. Pugsley had advanced considerable sums of money at various times and had not received the amount voted payable to him as vice president of the company. The Judgment. - After reviewing the evidence, Sir Douglas in concluding his judgment, said: 'After full consideration of the matter I can see very little in this case beyond an ordinary mortgage which was given to secure an issue of debentures which debentures are outstanding and on which default has been made. I agree with the argument advanced that, even if the debentures had been brought to the Trust Company and Mr. McDougall and Mr. Edward Domville, Mrs. Earle and Mrs. Wedderburn had been

able to say that they represented a majority of those debentures and wanted to waive the default, they could not under the circumstances of this case restrain the Trust Company from proceeding to foreclose. There is undoubtedly discretions resting upon a majority of the bondholders on the production of unregistered bonds to have the Trust Company delay proceedings, but this trust mortgage is no different from many others and that can only be done where in all other respects a company in keeping its covenants, and in this case those covenants have been violated and no business has been carries on by the company, the insurance has not been kept up and taxes are not being paid, and under such circumstances the trustee has a right to exercise its own discretion and go on and foreclose the mortgage. It is impossible for me to find that, in acknowledging the insolvency of the company, Mr. Pugsley, the only surviving executive officer and vice president, was doing so in the face of evidence that it was solvent and that he misrepresented the matter to the Trust Company. 'There will, therefore, be an order for foreclosure and sale of the mortgaged premises and a reference to a Master in Chancery for that purpose. The Master will have full power after considering the whole matter and deciding which is most in the interest of all concerned, to sell the same either in one lot or separate parcels. The costs of the Master and of the plaintiff will be paid out of the proceeds of the sale, but at the present time I will make no further order with respect to costs. So far as the liens against the property are concerned, they can be the subject of a future application after the property has been sold, and the proceeds therefrom deposited in a bank.'"

Carleton Sentinel - Jun. 1, 1923 Shale Company Organize. - Elects Officers - Retort Bought and Big Development Expected. - The Premier Shale Oil Company Ltd. has been organized. The board of directors are H.T. Stevens, A.A. Nevers, G.C. Richardson, H.B. Durost and H.D. Stevens. Officers elected: H.T. Stevens, president. A.A. Nevers, vice president. H.B. Durost, Secretary treasurer. This company is organized for the purpose of putting into operation one of the large Hartman Retorts for the extraction of Oil from shale. A contract for one of these machines has been signed and the machine will be delivered not later than August. The company has taken out a lease on a block of shale lands in Albert county and everything is set for a big development."

Telegraph Journal - Sep. 14, 1923 Oil Shales Case in Appeal Court. - (Special to the Telegraph Journal). - Fredericton, N.B., Sept. 18. - ... F.J. Hughes, K.C., opened his argument for the defendants, Finance Corporation of Canada, Limited, Edward Domville and Isabel Earle in support of an appeal from the decision of Sir. J.D. Hazen, Chief Justice, in the case of the Prudential Trust Company, Ltd. vs. Oil Shales Company of Canada Ltd., et al. Daniel Mullin, K.C., of St. John, and T.A. Skinner, of St. Stephen, are also appearing in this case which promises to occupy considerable time."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Mar. 25, 1927 Word comes from Ottawa that the development of the Albert county oil shales is in prospect. It is learned on good authority that a New York concern, which has been looking over many shale fields in the United States has decided in favor of Albert county, and is prepared to spend a considerable sum in development. It is reported that a new process has been discovered whereby the oil is extracted from the shale on a more profitable commercial basis than by former methods. It is also reported that the company will begin operations this year."

Evening Times Globe - May. 12, 1928 Shale Reduction in Albert County To Begin in Two Weeks. - Billions of Tons of Shale Available in Area of Several Square Miles With Light Overburden, Easy to Work. - Industry Will Employ 75 Hands. - Extensive Buildings and Machinery Now Ready to Convert Mineral Into Oil and Numerous Valuable By-products; Process of Reduction By Special Methods is Described. - By Staff Representative. The plant of the Maritime Eduction Company, Limited, situated on the five hundred foot slope overlooking Turtle Creek, at Rosevale, Albert county, about 22 miles from Moncton, and constructed at a cost of approximately $500,000, will be completed and handed over by the construction department of the operation branch of the company within a fortnight. The foregoing is the statement of E.H. Beckert, consulting engineering, who has had full charge of the construction since the fall of 1927, and who accompanied a staff representative of the Evening Times-Globe over the plant on Friday afternoon. So extensive is the deposit of shale to be exploited that it runs into many square miles and is estimated to contain billions of tons of oil shale, the by-products of which are numerous, including coal and tar, used in producing illuminating gas, crude naptha, carbolic acid, creosote oil and light lubricating oils. When in full operation the plant will be capable of producing 5,000 gallons of oil per day and will employ about 75 hands. In addition to the by-products mentioned, each ton of shale will produce about 60 pounds of sulphate. For fire prevention purposes the plant is piped throughout and the sprayers have a 60 pound pressure of water. The buildings include powerhouse, electric plant, machine and blacksmith shop, supplies building, garage, offices, crushing and screening and refining plants, large dining hall and bunkhouses, the last named accommodating 75 men. All structures are of neat design and finished in battle-ship grey color. Extensive Plant. - The powerhouse contains a large steam boiler of 250 H.P., air compressors used in drilling and mining operations, and blasting, etc., capable of compressing 2,500 cubic feet of air per minute, a compound steam engine of 500 horse power, generator and switch board, and 3 transformers and condensers. The large precipitators in the main separating plant weigh 9 tons each and all fittings used are of the 12-inch type. The two valves attached each weigh one ton. The plant is constructed in units so that it may at any time be extended to meet the demand for increased production. All the machinery in use is of the latest and most modern and many units have been patented by the company, one in particular the horizontal retort, being an invention of Colonel Kenneth Clayton-Kennedy, the managing director, who resides in New York. The plant was started in August, 1927, and when the first retort was installed, as a beginning of construction operations, the services of Mr. Beckert were secured and he came to Canada from Europe for the purpose of completing the engineering work and supervising the construction. He has had wide experience along these lines and at one time was engaged in the installation of the large power plant of the Federal Light and Traction Company in Sao Paulo, Brazil. To the enterprise and financial daring of Colonel Kennedy, he attributes the existence of this important industry in New Brunswick. Method of Operation. - The main lode or vein of the shale deposit, which has been located and uncovered about three hundred yards above the power house, is being freed of surface earth, about 12 feet in depth, by means of steam shovel operations. From this point narrow gauge rails are laid to the screening shed, a fork spur tapping the main line to carry off the waste earth from the diggings. The shale material is dumped into the crusher and then carried to the large screen for the purpose of 'dusting', or separating the powdered material from the shale. The powder in turn is carried off to the power house for fuel while the shale is conveyed by pipe to a revolving screen which is perforated with three-quarter inch holes. From this screen the shale is carried by small travelling buckets to a bin where the larger pieces are returned to the crushing plant for further treatment. Giant Retort. - The finely crushed shale left in the screen bin passes to the giant retort, which has a capacity of 140 tons and weighs 47 tons. It was said this retort can handle about 130 tons daily. Here the shale is 'cooked' at a temperature of 850 degrees, while the material passes through the revolving inner shell and the hydro carbon is liberated in gas or vapour form. These gases or vapor go forward into the gas collector, from whence they are conducted, by pipe, to be lodged in the large preciptator shells.

Electrical Screening. - At this stage the gases are electrically screened by high tension currents ranging from 40,000 to 50,000 volts, following which they are taken into the 'cracking box' by means of a suction pipe and are fractionated, the heavier tars liberated and removed by gravity to a lower compartment for further refining. The fractionated vapours remaining are then treated in a 'knockout' box, where the heavy lubricants are drawn off and the lighter lubricants piped to a Wheeler condenser and thence to a Wade refining system, from which the finished product is released. A study of economic operation is to be seen throughout the plant and wherever possible all waste is utilized and, as in the case of the shale dust used for fuel, the surplus gases are used in generating power. All lubricant waste or refuse is sluiced to the stream below and carried off to the Petitcodiac River. A.A. Swinnerton, B.A., S.Sc., of the Federal Fuel Testing Station, Ottawa, who is making a tour of the Maritimes in the interest of his department, visited the Rosevale plant on Friday and gathered considerable data on the plant and extent of the operations there."
Telegraph Journal - Nov. 8, 1929 Date For Sale Of Plant of Bankrupt Co. To Be Set.- Maritime Eduction Property Involved. - Albert County Court Judge Gives Intimation of Action Following Application on Part of Workmen. - Moncton, Nov. 7 - (Special) - Judge Jonah, of the Albert County Court intimated today, following application of R.M. Palmer, solicitor for the workmen in the case of the lien holders against the property of the Maritime Eduction Company, that at the next sitting of the court he would set a date for the sale of the company's plant in Albert county. Application for the sale of the plant was made by other lien holders. The claims of C.J.H. Parker and Lennox Keene were proven at today's sitting of the court, which was held here for the convenience and by the consent of all parties concerned. Those in attendance were H. Lester Smith, clerk of the court; G.P. Leonard, Saint John, court stenographer; R.M. Palmer, representing the workmen; W.F. Lane, for B.W. Lockhart, Limited; Harry Reilly, for Sumner Co., Ltd., and Hon. E.A. Reilly, K.C., for the Prudential Trust cO., Ltd., trustees for the bondholders of the Maritime Eduction Company."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Jul. 10, 1931 Crushed bituminous shale will be tried as a dust layer on the provincial highway near Sussex. The shale, which has properties of asphalt and pitch, is found about four miles from Sussex. When the sun strikes it after it has been spread on the road, it is said to produce its own binder. Some of the shale has already been brought out to the road and will be crushed in the government rock crusher."
Kings County Record - Jul. 30, 1942 Geological Possibilities of Section of Kings County Object of Official Survey. - Party Seeking Possible Outcrop of Oil Bearing Shale in Norton District. - Some Oil Signs. - Square Roughly Drawn With Sussex, Hillsdale, Kingston, Washedemoak as Corners.- A certain square of Kings County is at present being carefully searched by geologists, who are watching for signs of outcropping in this county of the oil bearing shale of Albert County. It is stated that the formation of the rocks of many geological periods indicate that the 'grain' of the rock formation from Albert Co. stretches in this direction. The square being searched is one with Washedemoak Lake at the upper left hand corner, Sussex at the upper right, Kingston at the lower left and Hillsdale at the lower right. This section is being carefully combed and rock formations from all districts within the area are being analyzed. The operations are going on in the camp which is now situated just to the north of Norton. Engineer Group. - Prof. G.S. MacKenzie of the University of New Brunswick, is in charge of the work; and with him are associated three senior engineering students. These are John McNair, son of New Brunswick's premier; Arni McAllister of Sussex and Jack Webb of Fredericton. This group are not prospecting, or mining copper, as has been reported, but are merely preparing what is known as geological map of the square of territory previously indicated. Interesting results have been noted in this work. According to Professor MacKenzie traces of copperhave been noted in the area; and in the district of Moosehorn definite traces of oil shale have been discovered. It was in this area, that, according to a veteran resident of Norton, many years ago a farmer in the Moosehorn district by the name of Aiton had declared that he had found oil on his farm; and had urged the then financial powers of the province to investigate. This was never investigated at the time and nobody is living now who knows where Mr. Aiton found the oil traces. Varied Forms. - The various forms of rock found in the different localities vary greatly. Some oil shale type of rock has been picked up, and the large catalogued collection of various formations include some richly colored agate from the Washedemoak area. Some time ago in the vicinity of the county line at Brown's Flats definite signs of lead and zinc were found. This survey began about June 3rd and the head of the little expedition declares that there is still a great deal to be done. He explained that the boys do not dig into the ground, but merely take the surface stones for examination. When it has been established that a certain type of rock is present in great quantity in certain parts of the county square, this is marked on the map in color. Various colors indicate different rock formations. The leader of the group pointed out that they are not looking for minerals or metals, but for formations of rock that might indicate traces of metals, or, as has been said, the oil bearing shale. The geological camp is located on the banks of a small stream about a mile or so from Norton. One tent is used as an office and three other tents furnish the living quarters for the party. A well equipped cook tent is presided over by Charles Young, of Ripples, N.B., well known for his ability in the culinary profession."

Codes: A2 / IDX_Names: Albert / Kings County Oil Shales;
Kings County Record - Jun. 24, 1954 May Get Power From Oil Shale. - The Financial Post says in its current issue, that, for the first time in Canada, power may be produced in New Brunswick from the burning of oil shale in the Hillsboro district about 10 miles south of Moncton. The story says that 'from the ashes of the operation, a large chemical industry may rise within the next three years, which would make New Brunswick a potential aluminum and fertilizer producer.' In Fredericton, the vice chairman of the New Brunswick Electric Power Commission, C. Hedley Forbes, said the commission was not prepared to buy shale- produced power at what he termed 'too high a price.' Nor did the commission want to take power on

a 24 hour-a-day basis, as had been suggested. Have Held Conferences. - The Financial Post said alumina and potash are by-products of the shale-burning process. It said a Montreal firm, Nashwaak Corporation of Canada Ltd., is negotiating with the NBEPC for the sale of power produced from burning the shale. (Mr. Forbes said representatives of the firm have conferred with NBEPC engineers, but no agreement had been reached. He said the commission would take power from the source if it could be bought cheaply enough, but did not require it more than 12 hours daily, when load demands are heaviest). Newly incorporated, Nashwaak Corporation is being backed by a large New York investment house, the publication said. Initial financing was said to be $12,000,000, with the issue expected shortly. President of the venture is Garnet G. Copeland, a metallurgical engineer, one of the principals in the original exploration of properties now owned by Brunswick Mining and Smelting Corporation. Largest N.B. Plant. - The company envisages a $7,500,000 power plant, the paper said. Largest in New Brunswick, it would generate 55,000 horsepower through two 20,000 kilowatt, 60 cycle turbo-generators. 'We're most enthusiastic and have already completed engineering and construction plans for the Nashwaak project,' E.A. Charlton, vice president and general manager of H.K. Ferguson Co., of Canada, is quoted by the Post. His company has been in charge of engineering at Alcan's Kitimat development and now is completing a $20,000,000 plant for Imperial Chemical Industries of Canada at Millhaven, Ont. The paper said it was told by Nashwaak officials that their method of producing electricity from the low cost, low grade fuel not only prices power below that made through coal-fed steam generation but actually produces electricity cheaper than it can be produced by hydro, because of the much smaller amount of capital investment required, and it is a 'firm' out put, not dependent on water flow.' Alumina is the ore being carried from Jamaica to Kitimat, B.C., by Alcan to produce aluminum. With power on the spot, all the elements of a new aluminum industry could be present at the New Brunswick site. 'It is certainly a long term possibility, although at the moment our aim is to get the power project under way, with the chemical phase following later', Mr. Copeland told the publication. It said the potash part of the burned out shale could form the basis of a fertilizer industry. Running through the shale deposit is a wide vein of albertite, but the company had not decided whether this mineral would be extractable on a continuous basis. Albertite is bituminous material, resembling asphalt. Heat To Generate. - The process used to extract the alumina and potash requires the burning of crushed shale. The tremendous amount of excess heat developed would be used for the steam generation of electric power. The deposit would be mined by open pit methods, probably down to 400 feet. The Post stated company officials said the scheme would not replace any of the present outlets for coal in New Brunswick because the shale has a lower heat content than coal and cannot be transported economically over long distances. Power would be produced only at the mine site. An NBEPC line is near the site. the paper said, and transmission of power would not require extensive outlays by the province. It said the commission has estimated that while the province's 1854 power consumption will total about 350,000,000 kilowatt hours, by 1960 this total will be nearly doubled to 600,000,000 kilowatt hours, excluding large blocks of firm power required by the Bathurst mining development. The Nashwaak mine site is closer to the Bathurst area than the commission's Beechwood development, the paper said. A federal department of mines and resources geological study of the Albert mines region states that reserves of oil shale at the Nashwaak site amount to 100,000,000 tons to a depth of 400 feet, the Post said, adding this is ample to supply fuel to the proposed power plant for 100 years. The mine site is on a C.N.R. branch line which formerly served the Albert mine, where bitumen was extracted prior to an unsuccessful attempt to take petroleum from the shale."

Richibucto Review - Apr. 6, 1899 Albert Co. Coal Deposits. - To Be Developed By New York Capitalists. - Mr. J.R. McDonald, the New York capitalist, returned to Moncton yesterday from Fredericton. While at the capital he was interviewed by a Gleaner reporter. As is known to many persons in New Brunswick many thousands of dollars have been expended in prospecting and developing the oil deposits at Baltimore mines, in Albert county. It is also quite well known that those thousands of dollars have not as yet yielded to the investors a paying percentage upon their investment, and that the oil works at the place named have been abandoned and that Westmorland county is to be the scene of the next operations in the search for oil. Mr. McDonald and those associated with himbelieve, however, that the oil which undoubtedly exists here is but a by-product of a more valuable mineral which exists in almost unlimited quantities and of incalculable value. Ever since the prospecting for oil began in Albert county it has been known that coal, or shale as it is called, was found in large quantities. Some people even took the trouble to ascertain that this shale was good for fuel, but so engrossed were the oil men in their enterprise that they paid little attention to what is now believed to be one of the most valuable coal deposits ever discovered, and Mr. McDonald and those associated with him are undertaking the development, mining and marketing of this coal. The nature and quality of the coal is said to be unlike anything yet discovered elsewhere and much superior to the best Scotch cannel coal for some purposes. It is particularly valuable for mixing with other coal for the production of illuminating gas. In this connection it is known that the gas works had a carload

of the Albert coal mined and transported to Moncton and that fourteen per cent of the provincial product mixed with the other coal in the production of gas gave better results than the very best Scotch article. Limitless quantities of this exceedingly valuable coal are said to exist right near the surface. That taken out thus far has been picked from a seam in the side of an immense hill or small mountain exposed by the rushing waters of a gorge. A similar seam of the coal is shown on the other side of the mountain and veins of it crop out on the very top of the hill, so that the reasonable conclusion is formed that the whole mountain is a solid mass of coal. A competent engineer who was sent by the promoters to look over the ground, estimates that two hundred million tons of coal are in sight and the real depth and extent of the deposit has not yet been tested. Mr. McDonald came here in the interests of a number of gentlemen who are associated with him in developing this coal deposit, and having looked over the ground he is much more sanguine of the success of the enterprise than before he left New York. He will return to New York almost immediately and organize his company, the capital stock of which will be about $1,000,000. The company will immediately proceed with the erection of works and the development of their property, and they expect to spend $200,000 before they are in a position to put their product on the market in any quantities. The nearest railway point to the deposit is the Harvey and Salisbury railway, eight miles distant, which connects with the Intercolonial railway, and the coal company will either purchase the Harvey and Salisbury road or build direct to the I.C.R., a distance of sixteen miles. The company will also need a water front and may make Moncton their shipping headquarters. By next fall the company expect to be shipping 1000 tons of coal a day from their mine, and in a year from now they calculate that their output will be 3000 tons a day, and that the enterprise will give employment to 3000 men. Mr. McDonald before his return to New York will probably interview the Minister of Railways

Daily Sun - Aug. 14, 1899 Boring For Oil. - Premier Emmerson Signs Agreement With Boston Capitalists. - Wells to be Sunk Next month in Four Counties - Albert Co. Cannellite Deposits to be Worked at Once. - (Moncton Transcript, Aug.12) - The Transcript learns that on Monday last the Hon. Mr. Emmerson, premier of New Brunswick, and Matthew Lodge of Moncton went to Boston in connection with the mineral oil exploration proposals. They were accompanied by Prof. Shaler of Harvard University, who had been in this vicinity for the week preceding. During his stay here the professor drew his final conclusions and decisions from the information and data collected during the past few months by his subordinates who have been making a careful survey. It is understood that Prof. Shaler from these conclusions reported favorably to his principals in Boston as to the territory and its prospects. That report may be more pregnant with importance to the future of Moncton than any other report made since the day the Bend was decided upon as the headquarters of the Intercolonial railway. It was in consequence of that favorable report that Premier Emmerson felt it necessary to visit Boston, with Mr. Lodge, as representing the New Brunswick Mineral Oil and Natural Gas company. They met the capitalists interested and found that Prof. Shaler's report was such they were ready to proceed with the practical work at once. Indeed they seemed to be so impressed by the outlook that their interest was manifestly deep; and an agreement was signed between them and the New Brunswick company. Under this agreement the Boston people are to expend within the time prescribed by the act $200,000 in exploring for oil and natural gas in this territory. An order was given for the necessary oil boring plant, and as such plant is easily available it is anticipated it will be on the grounds within two or three weeks and boring commenced by the first of September. One of the first borings will be made in the vicinity of Moncton, on a site determined by Prof. Shaler. The work will be done under local superintendence. Four preliminary borings will be made immediately in different parts of the province. The first will be in this county in the vicinity of Moncton, the second in Albert county; the third in Kent and the fourth in Gloucester. The object of these widely scattered preliminary borings is, if possible, to locate the outer boundaries of the oil territory of which Moncton is believed to be the centre; and not so much at the outset with the expectation of striking any great permanent flow of oil. The great store of oil is believed to be in the basin, of which this city is the centre, but the store is believed to be at an enormous depth. A feature of the agreement made which will be of interest is that should oil be discovered its refining and the manufacture of byproducts from the same must be done in the province. It may be added that the disposal of theinterests in the cannellite deposits at Baltimore, Albert county, has been made, and that work will be commenced there within a few days. Mr. Lodge has been authorized to employ the necessary men. Large quantities of the cannel will be shipped to Boston to make preliminary tests for byproducts."

Daily Sun - Aug. 14, 1899 Boring For Oil. - Premier Emmerson Signs Agreement With Boston Capitalists. - Wells to be Sunk Next month in Four Counties - Albert Co. Cannellite Deposits to be Worked at Once. - (Moncton Transcript, Aug.12) - The Transcript learns that on Monday last the Hon. Mr. Emmerson, premier of New Brunswick, and Matthew Lodge of Moncton went to Boston in connection with the mineral oil exploration proposals. They were accompanied by Prof. Shaler of Harvard University, who had been in this vicinity for the week preceding. During his stay here the professor drew his final conclusions and decisions from the information and data collected during the past few months by his subordinates who have been making a careful survey. It is understood that Prof. Shaler from these conclusions reported favorably to his principals in Boston as to the territory and its prospects. That report may be more pregnant with importance to the future of Moncton than any other report made since the day the Bend was decided upon as the headquarters of the Intercolonial railway. It was in consequence of that favorable report that Premier Emmerson felt it necessary to visit Boston, with Mr. Lodge, as representing the New Brunswick Mineral Oil and Natural Gas company. They met the capitalists interested and found that Prof. Shaler's report was such they were ready to proceed with the practical work at once. Indeed they seemed to be so impressed by the outlook that their interest was manifestly deep; and an agreement was signed between them and the New Brunswick company. Under this agreement the Boston people are to expend within the time prescribed by the act

$200,000 in exploring for oil and natural gas in this territory. An order was given for the necessary oil boring plant, and as such plant is easily available it is anticipated it will be on the grounds within two or three weeks and boring commenced by the first of September. One of the first borings will be made in the vicinity of Moncton, on a site determined by Prof. Shaler. The work will be done under local superintendence. Four preliminary borings will be made immediately in different parts of the province. The first will be in this county in the vicinity of Moncton, the second in Albert county; the third in Kent and the fourth in Gloucester. The object of these widely scattered preliminary borings is, if possible, to locate the outer boundaries of the oil territory of which Moncton is believed to be the centre; and not so much at the outset with the expectation of striking any great permanent flow of oil. The great store of oil is believed to be in the basin, of which this city is the centre, but the store is believed to be at an enormous depth. A feature of the agreement made which will be of interest is that should oil be discovered its refining and the manufacture of byproducts from the same must be done in the province. It may be added that the disposal of theinterests in the cannellite deposits at Baltimore, Albert county, has been made, and that work will be commenced there within a few days. Mr. Lodge has been authorized to employ the necessary men. Large quantities of the cannel will be shipped to Boston to make preliminary tests for byproducts."
Carleton Sentinel - Aug. 19, 1899 To Bore For Oil At Moncton. - A despatch from Moncton says:- The prospects of boring for oil in the vicinity of Moncton to be commenced at once has aroused no little interest in Moncton, and has created a spirit of buoyancy in business circles which bids fair to be felt to some considerable extent. A test hole it is now said, will be sunk on the outskirts of the city and another probably at Memramcook. The machinery ordered for the boring is expected to arrive in a week or two and will be set up at once and will be placed in charge of competent management. Men are to be employed at one mining shale at the cannel mine in Baltimore, Albert county, and as a certain amount of skilled labor will be required it is probable some experienced men may be got from Springhill or other Nova Scotia mines."
Daily Times - Aug. 22, 1899 Oil and Shale. - Active Work of Development Proceeding. - Good progress is being made with the preliminary work in connection with the development of the oil areas in this province. Oil boring plant to the value of about $50,000 has been ordered and it is expected to have some of it at work early in next month. The oil Company have a number of experts steadily employed making explorations. Mr. J.R. McDonald of New York who represents the capitalists interested in the Albert shale works, reached Moncton yesterday. The company are putting some thirty men to work with Mr. Watson Lutz of Moncton and John Brown, practical miner of Springhill in charge, getting out an experimental
Daily Times - Sep. 8, 1899 Coal and Oil Projects. - Mr. Edward A. Clark, of Boston, who has the contract for boring in connection with the oil boring project, arrived in the city yesterday and expects to commence work at once. The first boring machine is expected to reach Moncton on Monday and will be set up immediately on the site where the first hole is to be sunk. It is understood that the sale of the Baltimore cannel coal mine property was completed by the late owners to the representatives of the New York syndicate on the 4th inst., and that the papers will be formally passed over to the company in New York on Monday next. The company will be organized under the laws of New Brunswick and one of the schemes is to build a branch road from the mine to connect with the Albert railway. It is hoped to have the mine in operation inside of ten days and the branch railway in operation as soon as possible as the contractors can build it."

Codes: A2 / E2 / IDX_Names: Albert / Kings County Oil Shales; Oil and Gas - Kings Co.;
Daily Sun - Dec. 6, 1900 Albert Co. Coal. - J.R. McDonald, the New York capitalist who is interested in the development of the shale and oil deposits in Albert and Westmorland counties, stated the other day to a Fredericton Gleaner reporter that the company which was organized by him to develop the shale deposits at Baltimore, near Dorchester, had been at work all summer, and had thoroughly tested both the quantity and the quality of the coal, and it has proven to be of even superior quality than anticipated, and is found in practically illimitable quantities. The export of the coal will be carried on extensively next season, Hillsboro being the probable port of shipping in summer and St. John in the winter. The object of Mr. McDonald's visit to Fredericton at this time was in connection with another company which he is promoting. Yours truly, M.

S.J. Standard - Aug. 16, 1910 Companies To Exploit New Brunswick's Oil. - Great Corporations Being Formed on Both Sides of the Atlantic to Work Rich Oil Shales. - That the mineral wealth ofthis province has received an important addition which when developed will mean big things for the province is evident from the attention which is being paid to the oil deposits in Westmorland and Albert counties. Already there are two companies engaged in the development of these deposits and they have an active programme outlined. One of the companies, in which Senator Domville is interested, is known as the General Oil Shales Company of Canada, Limited, and the other is the New Brunswick Oil Shales Company. The former company has areas at Albert Mines and has twelve square miles of shale bearing land, enough to yield a supply of oil for many years. At the present time they have 120,000 tons of shale on the dump and are working in four shafts and three tunnels. A syndicate to work the property is being floated in London and Paris and it is believed the company has a great future before it. The activity of the other company is told of in a despatch from Paris appearing in the New York Times of recent date. After telling of the forming of the corporation which the despatch says is going on on both sides of the Atlantic, the article continues as follows: The subject has been opened to important capitalists of both the British Isles and the European continent, and the British Government is said to be disposed to favor the enterprise in every legitimate way. John C. Calhoun at Head. - The concession is that of the oil-bearing shale deposits in New Brunswick. The man who controls the concession is Mr. John C. Calhoun, of New York, Sir William Van Horne, the Canadian railway magnate, has accepted a place on the board of directors of the new company. Mr. Calhoun, who is now in Paris, refuses to give any information about the enterprise for publication. He does not, however, deny any of the facts here stated. The oil bearing shale deposits in New Brunswick are said to be the richest discovered anywhere in the world.

They yield three times the amount of oil per ton and twice as much ammonium sulphate as the famous deposits in Scotland, which have been worked for more than a century. The railways of New Brunswick, Nova Scotia and Canada will, it is said, take from the company for their own purposes all the oil that it can produce, as its greatest value is as a steam generating and fuel oil, smokeless, and of intense caloric power. The British Government reserves the right to commandeer the company's ..?.. ..?..ing needed for the propulsion of war ships. These New Brunswick deposits are all above sea level, whereas those in Scotland lie 10,000 feet below the surface of the earth. The New Brunswick Company has areas of 190 square miles in extent and the principal part of the property is situated about six or seven miles west of the areas held by

Gazette - Aug. 16, 1899 Oil Exploration. - Premier Emmerson Talks of Latest Find. - Found Oil in New Brunswick. - Prof. Shaler's Report - $100,000 Already up to Make the Preliminary Borings - Albert Shale. - Oil and Wind, was the heading which the Sun placed over an editorial article which appeared in its columns after Premier Emmerson had made his first public announcement respecting the development of the oil fields which unquestionably underly the formation of a considerable section of New Brunswick. The mistake the Sun made was in attempting to make a political question out of the efforts of the government of the province to secure a thorough exploration of the province for oil. While in a measure the development of the natural resources of the Province is a political question, was much as the central figure of the policy of the government of New Brunswick is to develop all the resources of the province, the question of exploring for oil is one which is more practical than political and means much to every individual in this country. That there is oil in New Brunswick has been proven beyond reasonable doubt. Whether it will be found in quantities that will pay the men who risk their money in its search has got to be determined. The facts that have transpired so far are that a thorough exploration of the most likely oil districts has already been made and the geologists who have been engaged in this branch of the work are thoroughly convinced that the prospects for finding oil are excellent. Not only are the field workers convinced that oil will be discovered in New Brunswick but so is Prof. Shaler of Harvard College who has personally examined all the best chances discovered by the field workers, and on the opinion given by this eminent authority men of unquestioned financial standing, some of whom have previously profited by Prof. Shaler's advice, have decided to invest their cash in borings, to ascertain whether the surface indications are borne out. The very fact that such men are willing to risk $100,000 immediately in boring for oil and have ordered the necessary machinery to be sent to the places selected as soon as it can be got ready makes the question of exploring for oil an intensely practical one and removes it out of the category the Sun tried to place it in. Premier Emmerson who has given the oil question great personal attention has recently been in Boston where he personally interviewed the capitalists who have been induced to put their money into the enterprise. At the Royal Hotel last night Mr. Emmerson said to a Gazette reporter, Do I believe that oil will be discovered in large quantities in New Brunswick? I most certainly do. During the summer a most careful examination of the whole county of Gloucester has been made by a corps of experienced geologists who have made most favorable reports of the surface indications they have discovered. Not only Prof. Shaler at Harvard University, who is the head of the department of geology and kindred students at that great seat of learning, Harvard University, has confirmed the report of the geologists who have been at work during the summer. Prof. Shaler went to Moncton in the latter part of July and drove from Moncton along the whole length of the North Shore making a personal examination of all the best chances discovered by his assistants during the summer. He also examined the river beds of the country and left with the opinion that there is a great future in store for New Brunswick through the development of her financial resources. I am thoroughly convinced after talking with Prof. Shaler that we have oil in New Brunswick and I may explain that Prof. Shaler is not only an eminent scientist but a practical oil borer. He has not only made a careful examination of the oil fields of Pennsylvania but he has located valuable oil wells in Virginia for some of the same gentlemen who are financially interested in the New Brunswick venture. Prof. Shaler is not a promoter, he is a man of science with a wide practical knowledge of oil producing country and thoroughly conversant with the surface indications of oil in other parts of the continent. His opinion is most valuable and I have no doubt that results of the greatest importance to this province will follow his exploration of this country for oil. One of the great advantages to the province , continued Mr. Emmerson, that will attend the exploration of the country for oil will be that the borings made will show the character of the formation under the surface. There has been comparatively little boring done in this province and nothing is really known about our mineral resources. Under the act passed last session the parties exploring for oil have no rights in other minerals. All these pass to the Province and other minerals come under the general mining act passed several years ago. I regard the exploration of the province that will be made by the men seeking oil as most important, and likely to greatly increase our knowledge of the stores of mineral wealth which I am convinced lie underneath the surface of this province. Prof. Shaler is of the opinion that this province contains much mineral of various kinds, and he is certain that great surprises are in store for the people. I might also point out that while there is no scarcity of oil at present, many of the wells which were operated in the past have given out and whole districts where oil was formerly obtained are now barren. The importance of this to New Brunswick is that should oil be discovered the wells will be worked. Indeed it is one of the provisions of the act under which the exploration is being made that should oil be discovered the wells are to be worked to their full capacity when such operation will realise 6 per cent per annum. The oil will also be refined in New Brunswick. In connection with the development of the oilterritory of the province I may say that arrangements have been made to work the shale deposits of Albert county, again. It has been discovered that the Albert shale will produce the finest analine dyes and a cargo of 300 tons is now being mined for export to test the quality of the shale in a large way. The tests of small quantities of the shale showed remarkably good results and it is hoped that the larger experiment will prove profitable. Experts say that the Albert shale is much better for the purposes of making dyes than the Scotch shale which is now largely used for the purpose. Altogether I have no reason to hope that there will be something come out of the exploration now being made for oil, and if we realize only a portion of the expectations of those who know most about it, it will be a great thing for New Brunswick and develop sections of the province which have been

Kings County Record - Feb. 2, 1923 The Development of Oil Shale. - Government Report Contains Expression of a Hope That Development of Shale May be Started Shortly. - A Big Retorting Plant to be Installed in Albert County. - Much interest is being taken in this section of the province, at the present time, in the matter of oil shale development. A big retorting plant is shortly to be installed on a property in Albert county. This retort will be the first real large commercial plant of the kind in Canada. Specimens of Canadian shale have been tested, and it has been proved that the latest retorts will extract the oil for commercial use from shale averaging as low as twenty gallons to the ton. On twenty tests made by the geologist in Canada, forty gallons to the ton or one gallon over a barrel was extracted from the shale. The average shales tested, produced the oil at a cost not to exceed fifty cents a barrel. The oil produced will be a little better than 35 gravity and the average production of a barrel of this shale oil will yield twenty-eight gallons of gasoline, twenty eight pounds of ammonia sulphate and 5,000 cubic feet of gas per ton of shale. The amount of gas necessary for heating purposes in the retort is 1,800 cubic feet per ton. The gas as it comes from the retort carries ten gallons of case in head gasoline from each ton of shale treated. This gasoline is extracted through a scrubber and washer. The surplus gas, outside of the amount required for retorting purposes is either burnt into carbon black or used commercially in the cities. Publication by the Federal Government Geological Survey Division of a book of seventy pages, dealing with the geology of what is termed the Moncton map area, presents the oil shale of the region as a commercial proposition worthy of practical development. The reports of analysis by department experts show favorable results, while the drain on flowing oil wells makes development of other supply sources a practical proposition. The government report contains expressions of a hope that development of the Albert shale may be started shortly, and that the experience and confidence gained from a successful industry in the Maritime provinces will lead to the establishment of similar industries in other parts of Canada. The report sagely remarks that boom in oil shale properties in the United States may lead not only to financial loss, but to delay in development. It is stated that 'the oil shale industry is a big manufacturing proposition involving an initial outlay of millions of dollars, large supplies of oil shale and careful preliminary experiments by chemical engineers. At best the returns are only a reasonable amount on sums invested'. The report points out that oil production from wells in America have passed the maximum and that hereafter there will be a steady decline, with the end of the well oil in sight during the next twenty five years. Hence reliable companies are turning their attention to oil shale, and experts agree that the development does not permit of 'wild-catting.' Geologists of note estimate that in Albert Mines there is an area 4,000 to 6,000 feet long, and 1,000 to 1,500 feet wide, in which most of the rocks exposed are oil shale. It is estimated that the depth of the deposit is at least 1,400 vertical feet. Samples of the shale yielded 32 to 52 imperial gallons of crude oil and 38 to 92 pounds of ammonium sulphate per ton. A large oil shale industry could be supplied for 100 years. At Rosevale, Albert county, there is a shale belt one quarter of a mile wide by four miles long. Beds of rich oil shale are also reported at Mapleton, Prosser Brook, St. Joseph's College and Taylor Village. The yieldof oil is as high as that from Albert Mines and Rosevale. Since May, 1921, the D'Arcy Exploration Company, a subsidiary of the Anglo-Persian Oil Company, has experimented with Rosevale shale, with satisfactory results. As high as thirty five imperial gallons per long ton of shale have been extracted. In Pictou county, Nova Scotia, oil shale is found in area of twenty square miles near New Glasgow. The oil content of some of the shale in Pictou range from 20 to 126 imperial gallons of crude oil per long ton. In Antigonish county, N.S., oil shale is also reported, yielding 20 to 25 gallons to the ton. It would appear that the Kennebecasis Island also possesses shale rocks of potential value. The very interesting and valuable government report presents the Albert and Kings county shale as a sure supply source for one of the world's most important products, but suggests early development as a practical necessity of the law of supply and demand. The time would therefore appear to be ripe for active interest in what has been recognized for very many years as a potential source of wealth. Care must be taken to

Codes: A2 / E2 / LEGI / IDX_Names: Albert / Kings County Oil Shales; Oil and Gas - Kings Co.; Legislation, etc.;

Royal Gazette - Aug. 15, 1866 Cap. XXXIII. An Act to incorporate the Provincial Oil Company.Section. Section. 1. Company incorporated. 5. Stock of 2. First meeting, when held. Shareholders, for 3. Capital stock. What liable. 4. Stockholders, for what 6. Sale of stock, when liable. And how made. 7. Joint stock alone liable. 8. Proviso. Passed 9th July 1866. Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. That Charles Parker, George E. Leonard, and John Howarth, their successors and assigns, shall be and they are hereby declared to be a body corporate and politic, by the name of ""The Provincial Oil Company,"" and by that name shall have full power and privileges made incident to a Corporation by Act of Assembly of this Province, for the purpose of mining coal, shale, asphalt, 8 or asphaltic rock, and for the manufacturing and trading in oils and other illuminating or lubricating substances, and for purchasing, owning or selling mines or real estate required or necessary for these purposes, and for such other busines as may be incident thereto. 2. The first meeting of said Corporation shall be held at such time and place in this Province as may be appointed by a majority of the above named persons. 3. The capital stock of the said Company shall be one million of dollars, divided into ten thousand shares of one hundred dollars each, with the privilege, within three years, to increase the capital to one million five hundred thousand dollars, divided into fifteen thousand shares of one hundred dollars each. 4. Each and every shareholder in said Corporation shall be held liable to the said Corporation for each and every call or assessment made, not however to exceed in amount the stock subscribed for by him, for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, for the purposes of, or to carry on the operations for which the said Company is incorporated; which call or assessment may be sued for and recovered in any Court of Record in this Province. 5. The capital stock held by any shareholder in the said Company at the time of making any call or assessment thereon, shall be liable to the payment thereof; and in case of non-payment of such calls or assessment at the time when the same shall be made payable, the Directors are authorized to order a sale to be made of so many of the said shares as they may think necessary for the payment thereof, with interest and expense. 6. Such sale shall be made at auction, upon not less than thirty days notice by the President in some Newspaper published in the City of Saint John, and the stock shall be transferred by the President and Secretary to the purchaser, who shall thereupon be entitled to a new certificate thereof; and the proceeds of such sale shall be applied towards paying the amount of such call or assessment with interest, and the costs, charges and expenses of such notice, sale and transfer, and the residue (if any) to the former owner. 7. The joint stock and property alone of the said Corporation shall be responsible for the debts and engagements of the same. 8. Provided always, that the existence of the Corporation shall cease (except so far as regards the rights of creditors to sue for and recover debts due by the Corporation,) unless within two years from the passing of this Act there be filed in the Office of the Provincial Secretary a Certificate under the Seal of the Corporation, and verified by the oath of the President or Secretary, (which oath any Judge or Commissioner for taking affidavits in the Supreme Court is hereby authorized to administer,) setting forth that the Corporation have in assets and paid up stock in value, a sum equivalent to fifteen per centum of the proposed capital stock of one million of dollars."

St. Croix Courier - Apr. 20, 1899 Legislature. - ...Mr. Tweedie... dwelt at some length on the mining prospects of the province, particularly the oil industry, that have already yielded a revenue of $2,000, and the shale of Albert County...."

Daily Times - Apr. 20, 1900 Mining Enterprises. - What Development of Properties Means to Moncton. - A Word About the Promoters and Capitalists Interested in the Companies to Operate in Westmorland and Albert. - Mr. Alexander McElwee and Mr. J.R. McDonald, of New York city, returned yesterday morning from an inspection trip to Albert mines. Mr.McElwee purchased this week from Captain Henry A. Calhoun what is known as the Old Albert Mines property, consisting in all of some 1500 acres, and the property has been transferred to the New Brunswick Cannel Coal Company, already mentioned in these columns. Mr. McElwee is also the purchaser of the Salisbury harvey Railway, which is to be put into first-class shape this summer. The road will be ballasted with material taken from the Albert mines and new 64 lb. rails will be laid from end to end. Mr. McElwee, who returned to New York yesterday, is a gentleman of large means and undoubted business record and character and a man whose every action and move inspires confidence. He brings into this work a personality and energy that ensures success for the enterprise. This country should stand ready with open arms at all times to welcome to their midst just such men as Mr. McElwee. It is learned that although Mr. McElwee had never visited the Albert Mines property before, he is perfectly delighted with his purchase, and that on the first of June he will move there for the summer with his family and make it his headquarters. Mr. McElwee is thoroughly convinced that the representations made to him by Mr. McDonald and Major Catlin of New York and Mr. M. Lodge, of this city, are fully verified and will be more clearly demonstrated when they start operations on the extensive cannelite beds contained in this property, and further prospecting for the rich deposits of Albertite were mined so extensively some years ago. It has always been the impression of men who worked in these mines during the last years of their operation, that the property was far from being exhausted; and to prove that albertite still exists in this property, there has lately been discovered a small vein coming to the surface, which was traced and opened up for something over 1000 feet. It is the intention of the company to follow this small vein down and thoroughly prospect it in the hope that it will widen in depth as did the deposit formerly worked. It may be said in connection with this, that these shale or cannel coal properties extending from Albert to Elgin, have been systematically taken up by Mr. Lodge and brought to the notice of New York capitalists, with the result that today he has two cannel coal companies, one, the Baltimore Coal Mining & Railway Co., and the other, the New Brunswick Cannel Coal Co., and Salisbury & harvey railway Co., prepared to carry on large operations in the county of Albert. The Baltimore Coal Mining & Railway Co. has at ts head Co. John C. Calhoun of New York, a wealthy man who has associated with him large capital and some of the best men in New York as well as capitalists from London and Liverpool. Col. Calhoun is thoroughly convinced of the value of the product. They have not gone blindly into this matter but have taken something over a year to make investigations and those investigations have been carried on under the supervision of such men as Mr. F.S. Pearson and Professor Duremus of New York, and eminent English scientists. Col. Calhoun is a strong energetic man and his coming to this country brings to us one of the ablest financiers and broad- minded men of America. He is fully

cognizant of the great possibilities of this country and there is no doubt that this enterprise is only a small beginning of the greater enterprises Col. Calhoun has in mind to establish in this section. Every help and encouragement should be given him. The government cannot do better than to hold out a welcome hand to men of Col. Calhoun's class and every citizen of Moncton should co- operate to assist in the work of building up our province and city. Mr. McElwee has also placed the product in the hands of the best scientific authorities, and they have satisfied him as to the value of the property. With regard to this material, the quantity has never been a matter of conjecture. It is practically unlimited. As to its quantity and quality it has been examined by some of the most eminent scientists and geologists in America. Large projects of this nature cannot be consummated in a day, and men of capital will not invest their money until they are satisfied on every point as to the value of their holdings. It may be said in this connection, that the promotion and sale of both properties have been conducted almost entirely at the New York end, by Mr. J.R. McDonald. Mr. McDonald took this proposition up with Mr. Lodge and Major Catlin something over a year ago when he came first to look the property over for himself. He was satisfied that it was an immense proposition and something he could handle on the market. He took hold of it with great energy, and as above noted has been successful in bringing to this country representative men and large capital; and the people of this community should express their gratitude to Mr. McDonald, because the opening up and operation of these mines must benefit moncton to a greater degree than any other part of the Province. He has been here off and on for over a year, and by a great many of the citizens is regarded now as one of the people, and the people of Albert Co. should extend to Mr. McDonald a hearty greeting at all times when he comes amongst us. Mr. McDonald is still largely interested in these enterprises, and now that he has them placed on a working basis he does not lose interest, but, we are informed, will continue to give his experience and assistance in making them large producing concerns. Major Catlin has at all times been the adviser, and being a scientific man has carried great weight with people who were coming here to invest their money. He has shown an unfaltering faith in this property from the first time he visited it some three years ago."

S.J. Star - May 22, 1901 John H. Harding. - An Old and Well Known Citizen Died Today. - ... John Henry Harding was born in St. John, Jan. 2nd, 1818. His father was Thomas Harding, and his paternal grandfather William Harding, the Loyalist, who came to New Brunswick in 1873 ... Mr. Harding was concerned at one time ingold mining in Nova Scotia, in the Springhill coal minesat the beginning of their development, and in coal and shale production in Albert county. ..."

Codes: A2 / J8 / IDX_Names: Albert / Kings County Oil Shales; Albert Mines;
Kings County Record - May 15, 1914 Famous Albert Mine May Be Reopened. - Many Years Ago it as the Greatest Industry in the Country. English Company Reported Ready to Invest Millions in the 'Albertite' Fields. - Encouraging reports, from apparently reliable sources, have lately been received, fortelling extensive developments in the near future, at the Albert Mines, at Hopewell Hill, A. Co., once famous for its output of the far famed albertite mineral, and concerning which, many stories of prospective activities, both as to the albertite and the oil shales have been afloat. Lately, according to report, a large sum of money - up in the millions, has been underwritten in London, and Canadian bonds in this sum were forwarded to a London firm last week. The flotation is to be carried out at once, and a prominent and active member of the Canadian syndicate states that ground will be broken inside of sixty days. An option, also, it is said, has been secured on the Salisbury & Albert railway. If the proposition goes through as laid out, it will call for a large expenditure in plant equipment and the employment of several hundred men, all of which will be good news to the people of Albert county. The story of the Albert Mines, little known perhaps to the younger generations, furnishes many interesting pages in th history of Albert County, and tells the tale of a hitherto unknown mineral of great value which, taking its name from its location, made Albert county known throughout the world, by its unique and valuable product. To many, even in this country, in the present day the Albert mines is a name only. Older residents, however, well remember when this name meant a great industry with its hundreds of employees and an output of valuable mineral, ranging from 5,000 to 20,000 tons a year. Around the works, where now are dismantled buildings, and the silent pit mouths, was a thriving village, where business flourished and hopes ran high for bigger things yet to come. For some thirty years the work went on, a depth of many hundred feet finally being reached. Transported to Hillsboro on the Petitcodiac River, five miles a distance, by tram way, a fleet of vessels carried the output to the American market. Under the management of John Byers, an English mining engineer, the industry flourished and the 'Mines' grew to be the busiest centre in the country. For miles around the farmers brought their produce into the thriving and bustling village, where hundreds of families must be fed, and where there was a ready market. Prosperity reigned for many years, and then the change came. After reaching so great a depth the manager thought that the mining could not be carried on with profit and soon the work was abandoned. The plant became dismantled, the hundreds of toilers left for other fields and the village disappeared. In 1849, Dr. A. Gesner, a geologist of great ability, declined to adopt the theory that 'Albertite' as it was called, was a coal, but a form of mineral pitch which occurred in vein form, and claimed that it was exempt from the Crown Land Regulations then in force. A law suit was the result and at the end of the trial a mass of evidence was introduced, with the result that the Jury, composed of sturdy, Albert county yeomen, after listening for days to learned experts, whose terms were highly technical, and mostly Latin, brought in a verdict that the mineral was coal. Although Dr. Gesner lost his decision it was abundantly established afterwards that he was correct; Albertite was and is a true asphaltic mineral. The mining of this mineral was carried on at Albert Mines for nearly thirty years. The output in the year 1866 was over 20,000 tons, and for the entire period of operation, about 250,000 tons. The price ranged from $15 to $20 per ton. The length of the vein worked was 3000 feet; its depth reached 1500 feet and in width it varied, but in places, exceeded 17 feet. The vein descended almost vertically 1300 feet in unbroken formation. Nearly five millions of dollars were taken out of the Albert Mines before they were finally

closed down. While Albertite as a commercial commodity is practically unique, a deposit similar in composition is said to be found on the shores of the Caspian Sea, but not in quantities to permit of commercial operation. That other deposits of albertite exist in other parts of the Albert County, is a theory long held byresidents and local geologists. That a vein was located on the surface some 20 miles southwest of the Albert Mines in Hopewell parish, by an early settler years before Dr. Gesner's discovery, is a fact well established, but its commercial value was then unknown. In fact, since the day of its discovery, no one has yet been able to locate the spot where Mr. Hoar a well known settler of the early days, when travelling through the woods in search of cattle, came upon a surprising display of the glistening black mineral, that had been exposed by the uprooting of a large tree blown down by the wind. From the fact that Mr. Hoar himself, was never afterwards able to locate the find, having failed to mark the spot in the forest, those of a skeptical turn of mind, might be disposed to cast doubts on the discovery of the sturdy settler. It has, however, been established beyond a doubt that the discovery was actually made. Mr. Hoar was a reputable man, and he proved the truth of his story, if truth had been needed, by bringing out with him, samples of the mineral, some of which remained on exhibition for years. Many holes have been dug in search of the long lost 'mine' by enthusiasts in years gone by, but the uprooted tree with its rich disclosure, has not reappeared. Mr. Hoar himself after moving away, returned many years after with his sons and tramped for miles all through the woods, but all in vain. It would be good news if some fortunate individual would yet unearth this much sought for deposit. Who knows but it yet may come to pass? Should work be resumed at the Albert Mines, attention will probably be directed to the rich oil bearing shales, there being vast deposits there has been proven conclusively in mining albertite, as everywhere in the workings shale was present. Under treatment these shales have proven of greater economic value in their yield of both sulphate of ammonia and crude petroleum, than the shales of Scotland, where for

Conveyance to shall be made. purchaser, how 2. Sale, by whom ordered. executed. 4. Proceeds of sale, how applied. Passed 14th April, 1873. Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. That when and so soon as parties owning in all two-thirds of the stock of the Caledonia Mining and Manufacturing Company shall request the Directors to sell the property and personal estate, mining leases, and all other the property and effects, rights and privileges of the Company, such request to be shewn by a document in writing, signed by such request holders, or their agents duly authorized, the Directors or a major part of them may order such sale to be made. 2. Such sale shall be made under the direction of the President or such other person as the Directors shall 13 appoint, and may be made of the whole property together or in separate parcels, at private sale or at public auction; and if at public auction, the Directors and stockholders are severally allowed to bid. 3. Any conveyance to be executed pursuant to such sale shall be under the seal of the Company, verified by the President's signature, and shall be sufficient for conveying and assuring to the purchaser the property and estate thereby expressed to be conveyed, free from any trusts to the stockholders; and the purchaser shall not be bound to enquire whether such sale was made pursuant to the request of the stockholders, nor responsible for the due application of the purchase money. 4. Upon such sale or sales being completed, the Directors shall forthwith realize the proceeds, and after payment of the debts and liabilities of the Company, anddefraying all the costs, charges and expenses of and incidental to winding up the affairs of the Company, including therein, if they shall think proper, a reasonable compensation to the President for his services therein, shall divide the remaining assets of the Company among the stockholders pro rata according to the amount of their stock; provided that no stockholder shall be entitled to receive any dividend unless he shall have paid all calls due upon his stock."

Codes: A6 / IDX_Names: Westmorland County Coal;
S.J. Weekly Chronicle - Oct. 26, 1838 Coal Mine - We are informed that a coal mine was discovered contiguous to Dorchester River in Westmorland County, New Brunswick about two days ago. From specimens which have been examined by Mr. Joseph Avard, of Jolicure, the coal is judged to be of a very superior quality, and its value is highly enhanced by the facility of shipping it which is presented by the site of the mine. It is hoped that the government of New Brunswick will not obstruct the benefits likely to accrue from this discovery by allowing the monopoly, which was lately developed of the N.B. mines to a company of American citizens. - Halifax Recorder."

N.B. Courier - Oct. 27, 1838 Coal Mine. - We are informed that a coal mine was discovered contiguous to Dorchester River in Westmorland County, New Brunswick, about two days ago. From specimens which have been examined by Mr. James Avard, of Jolicure, the coal is judged to be of a superior quality, and its value is highly enhanced by the facility of shipping it which is presented by the site of the mine. - Hal. Rec."

N.B. Courier - Dec. 2, 1848 and N.B. Reporter - Dec. 8, 1848 Coals from Dorchester. - During the present week a cargo of coals has arrived from Dorchester, Westmorland County, which is of an excellent quality, and ignites very quickly. It produces a brilliant light, and is said to be much superior to the imported article for generating gas. We learn that a quantity of this coal has been purchased for the use of the Gas Company. It gives us much pleasure to notice the efforts that are being made to develope the resources of the Country, and that in this instance we are indebted to Mr. John Steadman, a native of this Province, for the valuable discovery. - New Brunswicker."

Miramichi Gleaner - Dec. 5, 1848 Coal from Dorchester. - It is with much satisfaction we copy the following paragraph from the New Brunswicker. We question much if it were not for the present depression in the timber trade of the province, we should not have had such a gratifying piece of intelligence to record. We have no doubt that much good will eventually grow out of the present stagnation in this hitherto all-absorbing business. Necessity will force men to turn their attention to the long neglected resources of the province: During the present week a cargo of Coal has arrived from Dorchester, Westmorland county, which is of an excellent quality and ignites very quickly. It produces a very brilliant light, and is said to be much superior to the imported article for generating gas. We learn that a quantity of this coal has been purchased for the use of the Gas Company. It gives us much pleasure to notice the efforts that are being made to develop the resources of the country, and that in this instance we are indebted to Mr. John Steadman, a native of this province, for the

St. Andrews Standard - Dec. 27, 1848 Memramcook Coal.- The discovery of this article has, we believe by no means a recent origin, but it is only lately, so far as we can learn, that the coal has been excavated and brought to market. We sincerely hope that no pains may be spared in fully developing, and in testing the usefulness of this very important natural production. If the man deserves the thanks of his country who raises two blades of grass, where only one grew before, certainly he who can succeed in bringing thousands of chaldrons of coal to market from a source which hitherto has not supplied a bushel, is richly entitled to at least, the same measure of gratitude as the grass producer.- St. John Albion."

Colonial Farmer - Aug. 4, 1873 Coal has been discovered in a stream near Dorchester."
Chignecto Post - Dec. 28, 1876 Coal Discovery.- A seam of coal has been found on a lot of land at Shemogue, Botsford, owned by Hon. A.J. Smith, and others. It is known to be nine inches thick; how much thicker remains to be seen."

Codes: A6 / IDX_Names: Westmorland County Coal;
Morning Freeman - Dec. 30, 1876 Coal Discovery. - A seam of coal has been found on a lot of land at Shemogue, Botsford, owned by Hon. A.J. Smith and others. It is known to be nine inches thick; how much thicker remains to be seen.

Chignecto Post - Oct. 12, 1876 Bennett's Coal.- Col. Bennett is selling Round Coal at $3.50, and small coal at $1.50 per chaldron, at the mine. The roads are now in excellent condition. The coal has been carefully mined and is received with ever increased favor by those using it."

Daily Telegraph - Aug. 14, 1880 A Coal Discovery. - The Transcript says that three men from Dorchester, among whom was a well-informed miner, visited the Smith coal mine (so called) in Anderson, the other day, and reported that there was plenty of coal and of a good quality in that vicinity. This mine is owned by Sir Albert Smith."

Weekly Freeman - Aug. 21, 1880 M., a correspondent of the Transcript writes of a recent coal discovery in Anderson, Westmorland County:- Three men from Dorchester, among whom was a well-informed miner, visited the Smith coal mine (so called) in Anderson, the other day, and reported that there was plenty of coal and of good quality in that vicinity. We trust our hon. Knight of this County (A.J. Smith) who is the owner of the above mine, will at once commence prospecting. As it is said the coal is plentiful and of excellent quality it will, we think, be a paying business."

St. Andrews Standard - Feb. 1, 1880 The main shaft in the Cherryfield mine is down to depth of about 85 feet. The vein of silver is found wider and richer than at any time before."

Weekly Freeman - Jul. 2, 1881 Another coal discovery has been made at Round Lake, Botsford, Westmorland County. The vein or seam, whatever it is, is said to resemble albertite."

Chignecto Post - Jun. 23, 1881 and S.J. Globe - Jun. 24, 1881 Coal Discovery.-Messrs. J.S. Hickman and R.B.Boggs, of Amherst, have obtained leases of land at Round Lake, Botsford, where an outcrop of coal has been discovered. Whether it occurs in a vein or seam has not yet been developed, but it is believed to be two feet thick. The coal is highly bituminous and greatly resembles albertite. Until further prospecting is done, the exact character of the coal, and the value of this discovery will not be known. The ice of this lake is frequently thrown up in winter - supposed by accumulation of gases

Chignecto Post - Nov. 10, 1881 Messrs. Emmerson, Grant, and E.A. Charters have leased a coal area near James Anderson's mill. A habitant has offered to show them a five foot seam of Albertite on it for $500, with the stipulation, no coal no pay. The offer, it is said, will be accepted."

Chignecto Post - Aug. 10, 1882 Capt. Wilmot, of this place, has found theoutcrop of coal on his farm. The coal is much altered, and it is premature to say anything about the extent or value of it."

Moncton Daily Times - Apr. 3, 1883 The Moncton Coal Mine. - The Messrs. Blake have stopped work for the present at the shaft on their new coal mining property. There is water in the shaft and a decision of the stockholders as to whether they shall continue sinking the shaft or commence boring is being awaited."

Moncton Daily Times - Apr. 26, 1883 The Lutes Mountain Coal Mine. - A meeting of the share owners in this mine is called to be held at Browns Hotel, in this town, on Saturday at 2 o'clock p.m."

Moncton Daily Times - Apr. 30, 1883 The Lutes Mountain Mining Company. - A meeting of the share owners in the Lutes Mountain coal mine property was held at Brown's Hotel Saturday afternoon. Mr. Killam read a statement of the affairs of the mine, and it was decided to make another call of $1.00 per share and apply for incorporation as the Lutes Mountain Mining Company."

Moncton Daily Times - Feb. 16, 1883 Discovery of Coal. - Prof. R.C. Blake, Cherryfield's weather prophet, was in town Wednesday with specimens of coal obtained from the Wilson property in the mountains in this Parish. Some of the coal was tested and burned quite well. Prof. Blake thinks the coal is in sufficient quantities to pay working, and is confident he has bonanza."

Codes: A6 / IDX_Names: Westmorland County Coal;
S. J. Daily Sun - Feb. 19, 1883 and Weekly Transcript - Feb. 21, 1883 Lutz Mountain Coal Mine. - Yesterday we were shown a small sample of the coal found at Lutz Mountain before referred to. The coal resembles Sydney coal in appearance, but is very light in weight. The specimen shown us is almost as light as Albertite. It breaks easily, and when broken shows a bright, shining fracture. On a coal stove it burns very much like ordinary bituminous coal. It is said to burn up quickly and leave but little ashes. Further particulars in regard to the mine have also been furnished us. It appears that at a depth of about three feet in the ground a layer of coal 18 inches thick was struck. Next a layer of slaty material about six inches thick was passed. Below this coal was found to the depth of three feet. Under this again was a loose, black substance, resembling screened coal, and about 10 inches thick. Below this the main body of coal was struck, and the depth of this has not yet been ascertained. On Thursday the water came into the excavation, and Mr. Blake came to Moncton to procure a pump. It was intended to pump out the water, yesterday, and go on with the work of mining. -

Moncton Daily Times - Feb. 19, 1883 The Coal Discovery at Lutes Mountain. - Mr. Archibald Blake, who, with his brothers and father, Mr. R.C. Blake, of Cherryfield, (Moncton Parish) is sinking a shaft in a vein of coal found on the Peter Wilson farm at Lutes Mountain, also in the parish of Moncton, was in town on Saturday with a sled load of coal, and distributed a portion of it among citizens. A scuttle full was left at The Times office and when put in the stove burned clearly and briskly, made a hot fire and left no cinders. The coal is somewhat harder than Spring Hill and about the same brilliancy. It burns fully better than Spring Hill. Mr. Blake made the following statement to a Times reporter: We obtained this coal from a shaft sunk on the Peter Wilson farm, so-called. The coal was first discovered some years ago, when excavations were being made for a well. It was struck at a depth of 13 feet from the surface, and there being no water, and no value being placed on the discovery, the hole was filled up again. It is said the people who live in the vicinity all thought it was too handy the town for coal. Nothing was done till the 30th of January, when my father and brothers commenced digging on the understanding that if we found coal, we should get a lease on payment of $10 per acre a year rent for land used and a royalty of 10 cents per ton on all coal mined. We commenced to dig some 10 feet from where the well was dug and after going down 19 feet we found coal. We accordingly had the lease drawn up for 99 years and duly executed. The lease covers over 100 acres. We struck the coal a week ago last Friday, and that day took out four barrels, when we had to abandon it on account of water. Then came to town, got a pump and re-commenced work on Thursday last. Sunk the shaft two feet further. On friday we took out six barrels, some of which was tested by a blacksmith and pronounced to be No. 1. There is an appearance of albertite, and at times there is considerable gas. The vein at the present time on the east side of the shaft increased in thickness from 6 inches to 2 feet in 6 feet of digging. It is the entire width of the shaft, about 8 feet, and it is not known how much wider. It gets stronger of albertite as we go down. In digging we first struck a 2 inch vein of loose coal, then went through a foot of fire clay; then struck a 4 inch vein and another foot of fire clay; then an 8 inch vein, when we drove in six feet to the west and struck all the smaller veins leading into the one we are now working. Our plans for the future, are: On Tuesday we will commence a new shaft 100 feet from the present one and properly support it in order that we may work safely. It will probably be some time before we can determine the extent or value of the deposit. In further conversation Mr. Blake stated that the farm where they are working is situated near the base of the Mountain. The farm is not hilly or stoney and is much like adjoining farms in that locality. The senior Mr. Blake has for some years had a belief that there was coal on the farm. The discovery has excited considerable excitement in the vicinity. There are various opinions as to the prospects, but should moderate success attend the discovery, it would be a

Weekly Transcript - Feb. 21, 1883 Coal at Lutz Mountain. - Some time last summer, as Mr. Peter Wilson, of Lutz Mountain, about 9 nine miles from Moncton, was engaged in digging a well on his farm, within 200 yards of the main road, at a depth of about three feet from the surface, a substance resembling coal was discovered. After going down into it a foot or so, it being found hard digging, the attempt to make a well was abandoned. Matters stood this way for some time. When it was ascertained to be coal, there was some talk of forming a company to mine it, but this was not effected. Quite lately a practical miner has made arrangements with Mr. Peter Wilson and is now working the find. The pit is now dug down like a cellar, say 6 x 10 feet, and some 8 feet deep, 5 or 6 of which are in solid coal. Yesterday morning the bottom of the coal deposit had not been reached Some five hands were then at work and a large quantity of coal had been thrown out. The coal has been tested in the wood stoves of the locality and will burn in them till entirely consumed. Some of the coal has been hauled over to Irishtown. Mr. George Bentley, who has been on the spot and seen the coal and the operations to

Daily Telegraph - Feb. 27, 1883 New Coal Mine. - A Company is being formed for the development of the new coal mine at Lutz Mountain. The capital stock is $20,000, divided into 1,000 shares of $20 each. The subscription list is being rapidly

Moncton Daily Times - Feb. 28, 1883 The prospects for a mining company in Moncton are assuming practical form. The find of coal discovered at Lutz Mountain is to be worked at once. The prospectus of a company intimates that the capital stock will be placed at $20,000, with power to increase. The original owners of the mine reserve five hundred shares, and offer five hundred. The stock will be divided into one thousand shares of $20 each, and is rapidly being taken. -

Daily Telegraph - Jul. 7, 1883 and Weekly Transcript - Jul. 11, 1883 Lutz Mountain Coal. - Messrs. Lutz, Wilbur, Robinson & Co. have been for some weeks past boring for coal near the Blake mine. They have gone down 115 feet, passed through the rock and struck a stratum of fire clay, with coal and fire clay mixed below. The indications are very encouraging. The borings are so close to the other mine that the result will determine the extent of coal mining contained in that locality."

Codes: A6 / IDX_Names: Westmorland County Coal;
Weekly Transcript - Jul. 18, 1883 Lutes Mountain. - The parties from Moncton who are boring for coal, have not as yet found any of the mineral. They have a crew of nine men working at present. Two places are being operated upon; the first hole (on Abraham Wilbur's farm) is now about 150 feet deep while the second (on the I.N. Wilbur property) has only been worked for a short time."

Weekly Freeman - Mar. 3, 1883 The prospects of a mining company in Moncton are assuming practical form. The find of coal discovered at Lutz Mountain is to be worked at once. - Transcript."

Daily Telegraph - Mar. 3, 1883 Messrs. H.C. Charters and W.R. Angus, of this town, have secured the lease for 99 years of the Horsman farm, which adjoins the coal mine recently discovered by Mr. Blake on Lutz Mountain about 9 miles out of town. The owner's claim that excavations made prove that there isalso a vein of coal on the farm several hundred yards in width and only a little below the surface. Several loads of coal have been taken from the so-called Blake mine, and those who tried it pronounced it an excellent article."

Weekly Transcript - Mar. 7, 1883 New Coal Mines. - Messrs. Rufus W., Amos P., William H. and Thomas A. Ripley, who have dunk a slope at Fenwick, N.S. , about 60 feet, and found small veins of superior coal, with indications of a large vein. It is situated four miles from the I.C. Railway, and two miles from the Chignecto mines. Mr. A.E. Killam brought into town yesterday some more samples of the coal discovered by Mr. Blake at Lutz Mountain. These samples were taken from a new vein a short distance above the other opening. The result of the excavations so far are very satisfactory. The Horsman farm, which is situated on the north side of the mountain, has been leased by Messrs. H.C. Charters and W.R. Angus, and from the discoveries there made it is supposed that coal abounds, and that it is a continuation of the other

S.J. Daily News - May 1, 1883 A meeting of the share-owners of the Lutes Mountain coal mine property was held on Saturday at Moncton, at which a statement of the affairs of the mine was read by Mr. Killam, and a resolve agreed upon to make another call of $1 per share and apply for incorporation."

Weekly Transcript - May 2, 1883 Coal Company Meeting. - At a meeting of the Lutz Mountain Coal Mining Company, held in Brown's Hotel at 2 p.m. on Saturday, there were present Messrs. E. Steeves, M. Steeves, A.E. Killam, R.C. Blake, Archy Blake, H.T. Stevens, Joshua Peters, Joseph Blake, T.E. Henderson, H. Fleming, N. Bateman and others. On motion, H.T. Stevens took the chair and Joshua Peters acted as secretary. The report of operations was laid before the meeting by Mr. A.E. Killam, showing there had been expended in sinking test pits and getting lumber, pumps, etc., the sum of $420.67, and there had been collected on the subscriptions $1 per share - 241 shares - $241, leaving a balance due of $289.67. There are 55 subscriber's shares yet that can be had - $55 - leaving a balance yet to be provided by a new call of $289.67. On motion, it was resolved to make a further call of $1 per share to pay debts due, and to secure more leases; also to get an act of incorporation. It was also agreed between Messrs. Blake, Peters, Wilson and Killam that the lease should be handed over to the company without reserve, further than that the development of the mine should be proceeded with as soon as the organization under the charter could be effected. Mr. Killam was appointed to notify subscribers, and receive the money and pay the bills, and Messrs. H.T. Stevens, A.E. Killam, R.C. Blake, Norman Bateman and Ezra Steeves were appointed to get up a memorandum of association, secure signatures, and send it to the Provincial Secretary and get the incorporation. The meeting then adjourned."

S.J. Daily News - May 19, 1883 A co-operative company has been organized to bore for coal on the Horseman place,

adjoining the Wilson farm, Moncton."
Chignecto Post Nov. 15, 1883 and Daily Telegraph - Nov. 16, 1883 and S.J. Daily Sun - Nov. 17, 1883 and Chignecto

Post - Nov. 15, 1883 Coal.- Mr. William Price, in boring for water at Mount Whately, at the distance of twenty feet from the surface passed through a seam of coal, one foot thick, of excellent quality. Parties are in hopes of striking a larger seam below. Mr. Charles Fowler, who recently returned from Newfoundland, where he has speculated most successfully in copper, has been boring for coal on the Fowler homestead at Westmorland Point, but has struck nothing as yet."

Weekly Transcript - Oct. 24, 1883 Westmorland. - Mr. Charles Fowler, now of Newfoundland, but formerly of this place, has been prospecting for coal on lands owned by Mr. John Cahill. It is said he is meeting with daily indications that coal abounds in Westmorland as well as more gritty soil."

Moncton Daily Transcript - Jul. 9, 1885 COAL: - A Shediac correspondent sends us the following:- A large coal field has been found upon the farm of the late R.C. Atkinson, Scodouc River, which appears to be something worth looking after. It is in width about 300 yards. The prospectors dug in from the bank twelve feet. The seam was 2 inches thick at the bank, and 18 inches at the distance of twelve feet."

Moncton Daily Times - Jun. 3, 1887 Weldford Coal Mining Company. - A meeting of the stockholders of this company will be held at the Central Hotel at Weldford, Kent County, Monday, June 13th, for the purpose of electing directors."

Codes: A6 / IDX_Names: Westmorland County Coal;
Daily Telegraph - May 30, 1887 and Fredericton Capital - Jun. 4, 1887Coal at Weldford. - A new development company has been formed, the Telegraph says, at or near Weldford station, on the I.C.R., to prospect and explore for coal. The presence of coal has been suspected for some time, as small seams and outcrops have been found from time to time in the vicinity. Opinions differ in the matter. Those professing to know considerable about it, say that there will not be any quantity or depth of seam found. Be that as it may, the intention is to make an exploration, and a company has been formed with a capital of $75,000 to prosecute the work. It is divided into 15,000 shares of $3 each, and it is said $15,000 is

Chignecto Post - Aug. 10, 1893 Hard Coal.- On Friday last two men in the employ of Coroner Keith at Salisbury, while boring a well on his farm, struck a vein of hard coal which proved to be of superior quality. Dr. G.B. Chandler, of Dorchester, had a party at work near this place a few years ago but was unsuccessful. Mr. Keith intends opening up the

St. Croix Courier - Aug. 10, 1893 At Salisbury, on Friday, as two men in the employ of H.F. Keith were boring for a well on the latter's farm, near Moncton, they struck a vein of hard coal which upon investigation proved to be of superior quality."

Weekly Record - Fri. Aug. 18, 1893 A vein of hard coal of a superior quality has been found on a farm at Salisbury."

Weekly Record - Fri. Aug. 25, 1893 Coal in Westmorland 6 miles from Petitcodiac..."
Gazette - Aug. 28, 1896 Coal Near Moncton. - J.L. Harris has secured large areas of land near Moncton with the object of making a thorough test of the property for coal, samples of good quality having been found. A further test as to quantity is to be made and if expectations are realized steps will be taken at once to begin opening up the property. In the events of success it is proposed to build an electric railway from Moncton to the coal district."

Moncton Daily Times - Dec. 18, 1896 Moncton's Coal Areas. - The diamond drill will, it is expected, be in operation at the Gorge coal areas in Moncton parish some time during January."

Moncton Daily Times - Dec. 19, 1896 License To Search. - Mr. G.B. Lutz of Moncton has made application at the Crown Land office for license to search for Minerals in the parish of Moncton as follows: Beginning at the S.W. angles of License to Search, no. 165, distant about 3/8 of a mile SW from the mouth of Hall's Creek, thence running by the magnet South 2 miles, east 2 1/2 miles, North 2 miles, West 2 1/2 miles to beginning."

Daily Times - Aug. 6, 1897 Prospecting For Coal. - The work of prospecting for coal on the Vanbuskirk farm on the McLaughlin Road about two miles from Moncton, is being proceeded with on quite an extensive scale. The Messrs. Vanbuskirk, who are making the search entirely at their own expense, are very confident of striking a paying streak of coal. They have four men at work sinking a shaft about five feet square, and have already reached a depth of about twenty feet. Shale, red clay and other formations indicative of the desired article have been struck and the prospectors feel considerably encouraged. Bits of coal have been struck at intervals, but nothing resembling a seam has yet been

St. Andrews Beacon - Mar. 11, 1897 The government diamond drill has reached St.John. J.L. Harris, of Moncton, having been the first to apply for it will get the first use of it. He will employ it in prospecting for coal in Westmorland."

Gazette - Mar. 26, 1897 Moncton Capitalists have decided to spend $2000 prospecting for coal at the Gorge, about seven miles from Moncton. The government diamond drill is being used."

Daily Sun - Mar. 29, 1897 A meeting of those interested in the search for coal at the Gorge was held at the residence of J.D. Harris, Wednesday night. The work of prospecting will be under the management of the trustee, J.L. Harris. F.W. Sumner, M.P.P., W.F. Humphrey, C.W. Robinson and E.T. Trites. It is proposed to sell about fifty shares at $50 each and expend the total in boring and prospecting generally. Some twelve shares have already been taken. - Moncton Times."

N.B. Reporter - Mar. 31, 1897 Moncton people will spend $2,000 prospecting coal at the Gorge, seven miles from the city." Moncton Daily Times - Sep. 23, 1897 The Diamond Drill. - Hon. Mr. Dunn, Surveyor General, who was in town yesterday, drove out to the Mountains in connection with the working of the local government diamond drill, with which a local company has been prospecting for coal."

Codes: A6 / IDX_Names: Westmorland County Coal;
N.B. Reporter - Nov. 16, 1898 A coal seam three or four feet in thickness has been discovered on the farm of William and Bedford Cook, at Dorchester Cape. Mining license, covering an area of five square miles, has been taken out, and operations will commence at once."

S.J. Daily Sun - Nov. 16, 1898 A mining license covering an area of five square miles has been taken out by Wm. and Bedford Cook at Dorchester Cape, covering land on which coal has been discovered."

S.J. Globe - Nov. 21, 1898 Coal at Dorchester. - Moncton Transcript: While Bedford Cook was digging a well near Dorchester Cape, about twenty five feet from the surface, he came on a layer of dark soap stone about five feet in thickness. Digging through this Mr. Cook came on coal. He does not know as yet the depth of the seam. It is said that application for a lease of all the mining right of Dorchester Cape has been filed."

St. Andrews Beacon - Mar. 7, 1901 Coal in New Brunswick. - The discovery of the Joggins coal seam cropping out between Sackville and Dorchester is a fulfillment of the prophecies made years ago by practical mining men that New Brunswick contains the same coal seams as Nova Scotia. The contention is the upper deposits overlying the carboniferous stratum being softer in New Brunswick than in the sister province has been more affected by the erosive action in the glacial period, with the result that the coal areas have been buried under."

S.J. Daily Sun - Sep. 28, 1901 and N.B. Reporter - Oct. 2, 1901 A discovery of coal is reported from Cherryfield, about three miles from Moncton."

Weekly Record - Fri., Feb. 19, 1904 Reports of coal discoveries come to us from Shediac. Mr. Joseph Steward has been boring for coal on the Scoudouc River about a quarter mile further up river than the mine. Mr. Armour was working last summer, at a depth of 300 feet he struck a seam between three and four feet thick, so parties claim who have been

Kings County Record - Dec. 7, 1917 The probabilities are that a valuable coal mine has been discovered on the Gaspereau River about seven miles from Port Elgin, says a correspondent of the Sackville Post. It is being looked into by a Mr. Hussey, of Bathurst, who has spent tow or three weeks prospecting, and finds that the area is sufficient if only the depth is great enough to warrant the opening up of the industry. He has made a trial of the coal and finds it a very superior quality. Coal has been seen by others on this same river some years ago, but was not thought to be on a large enough

Codes: A6 / E2 / IDX_Names: Westmorland County Coal; Oil and Gas - Kings Co.;
Moncton Daily Times - Mar. 2, 1883 Mining Matters. - Messrs. H.C. Charters, of Charters & Fillmore, and Mr. W.R. Angus, of this town, have taken a lease of the William G. Horseman farm, which adjoins that on which Mr. Blake is now prospecting on the Lutes Mountains in Moncton parish. Mr. Blake's lease is on the south side of the mountain; the Horseman farm is on the north side. Coal has been found on it. Mr. Merritt Briggs, who gave information in regard to the outcrop, isinterested. Messrs. Charters and Angus have small samples of the coal. Some years ago oil from this farm ran into a neighboring mill pond in such quantities as to excite much comment. The lease of the farm is secured for 99 years on favorable terms as to royalty. The lawyer was to go in and complete the papers this morning. Mr. Blake was in town yesterday. He is sinking a shaft, and it is reported is now going through fire clay. Mr. G.B. Lutes is showing samples of silver ore,which it is said were obtained from a property within a few miles of Moncton. The mining excitement has revived the reports of the discovery of paint clay within about 20 miles of Moncton. Mr. Geo. Nichols of Cherryfield, states that he has tested the clay in its crude state and that after being ground and mixed it makes an excellent body. It has been used for rough work by the farmers in the vicinity."

Codes: A6 / LEGI / IDX_Names: Westmorland County Coal; Legislation, etc.;
Royal Gazette - Aug. 12, 1840 Crown Land Office, } August 11, 1840. } The right of working the Coals, and other Minerals in the following described Districts in the county of Westmorland, subject to the following regulations and conditions, will be offered at Public Auction at this Office on Monday the 5th day of October next, at the upset price of

Fifty Pounds on each District. Sale to commence at 12 o'clock, noon. Mining Lots in the County of Westmorland. Description of the Lots. The first Lot to extend from the junction of thePetitcodiac and Memramcook rivers, north till it meets a prolongation of the lower side line of Lot No. 45, granted to Peter LeBlanc in Dorchester, and to extend eastward from the Petitcodiac River to the rear line of the first tier of lots on the east side of the Memramcook, and to be bounded on the south by the lower side of Lot No. 14, granted to Charles Dixon, containing 3 30 square miles, more or less. The second Lot to extend from the Petitcodiac River, easterly to the rear line of the first tier of Lots on the east side of the River Memramcook, to be bounded on the South by the lower line of Lot. No. 45, (granted to Peter LeBlanc), and its prolongation; and to be bounded on the north by the lower line of the escheated DesBarres Tract, and its prolongation, containing 18 square miles, more or less. The third Lot to extend from the Petitcodiac across to the Memramcook River, to be bounded on the south by the lower line of the escheated DesBarres Tract, and on the north by a line to be run due east (true east) from the mouth of Hall's Creek, (at the Bend of the Petitcodiac), till it strikes the River Memramcook, containing 40 square miles, more or less. Regulations and Conditions. 1st. That the upset price on each lot be œ50 (fifty pounds) and the whole amount of the purchase money on each lot to be paid on the day of the sale to the Receiver General or other person authorized to receive the same. 2nd. That the right of mining on each lot be separately put up for the term of twenty five years, at a fixed rent of five per cent. on the value of the minerals raised, with the exception of coal, on which a duty of one shilling currency per chaldron shall be paid quarterly, on the 1st of January, 1st april, 1st July, and 1st October, in each year, to the Receiver General, or an Agent for that purpose to be appointed by the Government. 3rd. That two years be given to each purchaser, from the day of sale, to explore his mining ground, within the lot purchased by him, which ground so to be selected is in no case to exceed three miles square. But no mining operations are to be commenced or prosecuted until the lease be taken out. 4th. That the purchaser of each lot, after having explored and selected his ground, shall cause a survey and plan thereof to be made by some duly authorized Deputy Surveyor of the Province, and filed in the office of the Surveyor General; and that after such plan shall have been confirmed at the said office, a lease of the mines comprised therein shall be forthwith made out in accordance therewith. 5th. That after the said lease is executed and delivered, the lessee shall be allowed to work the said mines for three years, free of any rent or charge. 6th. That if the lessee shall not have actually commenced mining within two years after the date of the lease, the same shall be forfeited. 7th. That if the rent be behind or unpaid for the space of thirty days after the same shall become due, the lease shall be forfeited. 8th. That the lease contain a clause of renewal; and that the Government may take the improvements at a valuation to be made by arbitrators mutually chosen by the Surveyor General for the time being, and by the lessee or his assigns. 9th. That in no case shall a lease be executed for more than three miles square. 10th. That if the lessee or his assigns shall neglect to work the mines within his lease for any one year during the continuance thereof, the said lease shall be forfeited and revert to the Crown. John S. Saunders, Surveyor General."

Richibucto Review - Jun. 18, 1903 The K.N.R. (Kent Northern Railway?) have commenced operations in real earnest with the steamshovel in their gravel pit. They expect to deliver thirty-nine cars daily to the I.C.R. for two months."

Codes: B6 / IDX_Names: St. Martins Coal;
N.B. Courier - Aug. 11, 1838 The information contained in the subjoined paragraph, which we copy from the Boston Evening Gazette of Saturday last, will be new to many of our readers. Saint Martins is one of the Parishes comprised within the county of St. John, and fronts on the Bay of Fundy at no great distance from the City. We need hardly say that it would afford us much satisfaction to find that the mineral wealth of the Province was being developed by its own capital and industry; but as the means and disposition for undertaking extensive mining operations, appear to be wanting among us, we trust that British enterprise and capital will be directed towards the vast resources of New Brunswick, - and this, we have reason to believe, will be the case in a short time - for so far we are assured, the result of the scientific researches of Dr. Gesner, who has been employed by the Executive to make a survey of the Province, will warrant the outlay of a large amount of capital in prosecuting those important works."

Codes: B6 / IDX_Names: St. Martins Coal;
N.B. Courier - Aug. 11, 1838 Immense Grant of Mines. - American enterprise and British liberality. - Two citizens of New England recently visited New Brunswick. - One was a mineralogist, the other a merchant; and their object was geological research. This attention was especially directed to the tin, lead and other treasures of the great regions of St. Martins. Here among other things, they found a mine of bituminous coal of vast extent and value, and like true Yankees they resolved to possess, if they fairly could, the prize they had discovered. - After building a bon-fire with the coal, which proved to be of the richest quality, they repaired to Fredericton, the capital of the Province. They called upon the principal officers of state, and had a particular interview with Sir John Harvey, the Governor and Commander-in-Chief. He received them as a real English nobleman always receives intelligent and respectable strangers. They fully explained their designs; and at once struck with the importance of it, he warmly commended their enterprise. They were informed om all sides that the government and people would be highly gratified to see the mines opened and be extremely liberal in their encouragement to those who should first commence the business; and in a few weeks, as soon as the negotiations were finished, and the necessary parchments could be prepared, our two New England friends returned from the Crown Office with a grant under the great seal to themselves and their successors, of all the mines of every name and nature whatever, in the entire territory of St. Martins - comprising a space of more than two hundred and eighty-seven square miles! This is the first

grant of the kind ever authorized we believe under the laws of New Brunswick, and is considered to be one of the most munificent grants for mining purposes ever bestowed upon an American in a foreign land. It is estimated that the proper working of this single coal field above mentioned, independent ofthe profits of any of the other coal formations, and of any other minerals or metals within the confines of St. Martins, will pay the interest of hundreds of thousands of dollars per annum. Thus it may be seen how the enterprising spirit of our people penetrates into other climes; and that our citizens abroad, as these two gentlemen have done, not unfrequently achieve for themselves the most princely of fortunes. - Boston Evening Gazette."

Codes: B6 / IDX_Names: St. Martins Coal;

N.B. Courier - Dec. 1, 1838 The Quaco Coal Mines. - We have received the following letter from Mr. John Alexander, one of the gentlemen concerned in the discovery of Coal at Quaco, which we give entire: ""To the Editor of the Saint John Courier"" ""Dear Sir, - A friend has this morning put into my hands the Courier of the 20th of last month. - In it I find an article concerning the coal mines at Quaco and its vicinity, and which not only reflects unjustly on the two individuals who received a grant of mines in St. Martins, but ridicules the idea of coal being found in that region. Being one of the persons alluded to, I feel it to be a duty to myself, my friends, and the public, to refute the slander in question; and I trust that you will cheerfully give my communication a place in your paper. 7 ""The object of the article seems to be to allay any jealousy that might arise among certain persons, in consequence of others removing into New Brunswick to prosecute a business which the provincials are not disposed to carry on themselves. - In order that the article may have the desired effect, 'Jonathan', as he is called, is held up in derision to the public, and as a reckless speculator; as playing a 'vile hoax' upon his countrymen, by extolling his grant and coal mines, and then selling out his lease for thousands of dollars, &c. And to carry the object of the writer more fully into effect, facts or supposed facts, are brought to bear on the subject. The article alleges that 'in the summer of 1837, two individuals from Portland came to New Brunswick, made an examination of the geology of St. Martins, and decided on the extent of the coal; after which they obtained a lease from the Crown Land Office of all the mines in this Parish that they would discover and work. Having thus far been successful, they returned to the Province with a few miners in June last, and commenced operations. They however remained but a few days, when they all disappeared, and have not since been seen at this valuable coal mine.' In regard to the above statements I have only to say, that as far as they relate to the discovery and lease, they are very near the truth; but with regard to the return of the two gentlemen in June last, with a few miners, to commence operations, they are not true. We did return in June last, but we brought no miners. We did not commence mining operations. Our object was to simply remove the earth (which we did by employing three or four men who lived near the spot), from the coal bed, at a point where it had up to that time remained concealed from view, in order that we might the more readily obtain an accurate knowledge of the dip and line of bearing of the bed, and also procure a sample of the coal from a point nearer to the water level, which we accomplished to our satisfaction. So much for the 'mining operations'. The article further alleges, that this coal was discovered upwards of twenty years ago; that blacksmiths had dug and used it in small quantities from that time to present; and that a gentleman is now in St. John, who collected specimens of the coal ten years past. What of all this? What if coal was found to exist there twenty years ago? and what if there are specimens in St. John of the coal obtained ten years ago? Do not such facts conclusively show that coal exists in St. Martins? - And in the absence of proof to the contrary, may we not reasonably infer from the circumstances of coal being actually found there, that it is in reality a coal formation; and that if coal exists in small quantities, it may, as in all other coal formations, exist in large quantities also? But the writer would have it understood that a Dr. Gesner says that what was supposed to be a stratum of coal is nothing more than a 8 collection of lignite! This statement of the Doctor's flatly contradicts the above declaration, viz.; that coal was dug and used by blacksmiths during the last twenty years at St. Martins. ""I have not the honor or the pleasure of an acquaintance with Dr. Gesner; but one of two things is certain, if he made the statement; it betrays his want of knowledge of the geology of St. Martins, or his utter ignorance of the science he professes. I do not pretend to say that there is not lignite in that Parish; if it be there, I am ignorant of the fact - having never seen any; but that coals, and good coals exist there I am certain, having seen it, and dug it with my own hands. ""The writer closes by tauntingly saying ""our enterprising neighbours have suddenly abandoned the mine - having found out by digging into the cliff that no fortunes were to be made there; and perhaps that before this article goes to press, the lease will be sold for thousands of dollars."" This, Mr. Editor, is a gross mistake, your enterprising neighbors have not abandoned the undertaking. The lease is still in the hands of myself and associates; we intend to hold on to it; and we intend to, as soon as we can complete the proper arrangements to prosecute the exploration, and trust that our labor will be crowned with success, notwithstanding the attempt to discourage persons who undertake to prosecute mining operations in New Brunswick, by what I consider a wanton effort to depreciate the valuable resources of the Province. I might enlarge upon this topic, but I forbear, trusting that hereafter men of reputation and honorable feelings may be suffered to pursue a laudable enterprise, without being laid up to the public through the press, as unprincipled speculators, and as the authors of a villainous hoax. ""I have the honor to be Your most obedient servant, John Alexander ""Boston, 7th November, 1838."" With regard to the statements made by Mr. Alexander we beg to offer a few remarks; and in doing so, we assure him and his associates that we have no wish to check any laudable enterprise in this Province, but on the contrary would willingly assist in promoting its advancement, while at the same time we should feel bound to correct any mistaken ideas that might be entertained respecting it. Mr. Alexander begins by admitting that our statements with regard to the discovery of Coal, the Lease, &c., are very near the truth; he might have said quite true. The only point which he denies is bringing miners with him. He certainly did employ two British miners to commence what we jocosely termed 'mining operations' the nature and extent of which he describes 9

These points are not worth contending about, but we do contend that what Mr. Alexander is pleased to style ""Coal"" is lignite, and lignite only. At the moment of writing this, we have a piece of the identical substance before us, taken from the very spot where that gentleman says he dug coal with his own hands. It certainly is not bituminous coal, but a very different substance, and if Mr. Alexander will furnish us with a specimen of the genuine article from that locality, we will freely admit ourselves mistaken and make him all the amends in our power. We have no hesitation in stating any deliberate opinions, from all that we have heard and seen, that no coal field exists at St. Martins, and that in fact the geological formation of that district, almost precludes its possibility. Whoever attempts to dig coal there, will find that trap and granite are too abundant to expect a deposit of that valuable mineral in their vicinity. The statement we alledged of being made by Dr. Gesner, was certainly made by him, and in it we have the fullest confidence. We have the highest opinion of Dr. Gesner's skill and ability as a Geologist, and we know that he is acquainted with the geology of St. Martins, having recently visited it for examination. Mr. Alexander will find that he has reckoned without his host in attacking Dr. Gesner, who is now absent on a visit to Nova Scotia, but on his return we feel persuaded that Mr. Alexander will hear from him, fully, efficiently and in a manner that will not fail to convince, however unwilling he may be to believe. Since publishing the former article we have been at some pains to ascertain the nature and extent of the lease granted to these gentlemen, and as it may be important to many persons here, as well as abroad, to be acquainted with its terms, we give the following summary. The Lease is dated December, 1837, and grants to Messrs. Randall and Alexander, for the term of fifty years, all mines and minerals which they may within the period of two years from that date, discover, open and commence the efficient working of, within the parish of St. Martins, and that a radius of one mile shall be allowed, around each shaft to be opened, as constituting a mine. That a percentage equal to the value of one-twentieth of the produce of the mine shall be paid to the Crown, to commence at the end of ten years from the date of the lease. If the lessees do not within two years open, and work to effect any mine or mines or having opened any mine shall cease to work the same to effect for twelve consecutive calendar months, then the lease to be null and void. The lease is to be renewed at the end of fifty years for a further term of thirty years, or the improvements to be paid for at valuation, provided the shafts and workings are in good order. It will be observed that this lease confines the parties strictly to such mines and minerals as they may 10 discover, open and commence working of within two years, one of which has nearly expired. Mr. Alexander asks ""what if coal was found to exist there twenty years ago? Why simply this, that if he did not discover it, he has no right or claim to work it under his lease. - No power is given the parties to enter on private property to seek for minerals, neither can they do so without committing a trespass, unless the proprietor of the soil consents. Should they discover any mines or minerals on private property, they cannot work them until they obtain a lease from, or make an arrangement with, the owner of the land. They cannot purchase the land, because being aliens, they cannot, in New Brunswick, hold lands in fee simple. So far as we are able to judge, we conceive this lease confers on Messrs. Randall and Alexander little more than the privilege of exploring and discovering minerals for the benefit of the people of New Brunswick; and whenever they attempt to bring its provisions into effect, they will find their powers very limited indeed. We have no wish to injure these gentlemen or prevent them from ""going ahead"" if they see fit; but as it has been asserted that very great and extraordinary powers and privileges have been granted them, we deem it but right to give a correct statement. We wish such statements to go abroad as will prevent mistakes, so that whenever foreign capitalists do undertake any new

N.B. Courier - Dec. 8, 1838 Since the publication of our last number, we have been called upon by Dr. Gesner, who considers the information given in a former number respecting the non-existence of coal at Quaco perfectly correct. - With reference to the statements made in regard to operations pursued to open a mine, Mr. Alexander has confirmed them in his attempt at contradiction. The whole of the letter from Boston is so perfectly answered by the writer himself and the last Courier that farther reply is unnecessary. Dr. Gesner declares that if any person will ever procure a chaldron of good coals at the mine opened at Quaco by Mr. Alexander, he will retract all he has said respecting it, and freely acknowledge himself mistaken. He does not, however, fear that he will ever be called upon to perform that task. - If the statements made in a late Boston Exchange Gazette by an anonymous writer, and laudatory of a Dr. Jackson, had been reversed, they would have been true, and whensoever, the parties concerned will appear under respectable names, they shall obtain
Novascotian - Dec. 20, 1838 Coal Mines. - Considerable discussion has taken place in St. John papers, respecting the Quaco Coal Mines. Mention was made some weeks ago of extensive grants made to some American speculators in New Brunswick. Subsequently it was denied that any coal existed in the district included in the grant. One of the parties interested in the speculation combats this, and asserts to the contrary; but the St. John Courier repeats the denial, and, on the authority of Doctor Gesner, intimates that a chaldron of coal will never be raised in the district."
Novascotian - Nov. 1, 1838 The rumor of an important discovery of mines at Quaco, N.B. and of the extensive speculation of an American Company, has been pronounced a hoax or speculating trick, by the St. John Courier. The coal was discovered twenty years ago, but was found so scanty as to be of little value. The supposed stratum, it appears, has been pronounced worthless by Doctor Gesner."

N.B. Courier - Oct. 20, 1838 Nothing can be more amusing than the accounts which have appeared respecting the discovery of a great Coal Mine at Quaco, by the American Speculators from Portland, and the alarm which has arisen in consequence of the lease given to them by the Province of all the mines and minerals in the Parish of St. Martins. It appears some rumor of a Coal Mine at Quaco had reached Portland, from thence two individuals came to New Brunswick in the summer of 1837, and having made the requisite examinations of its situation, &c. and by their ""geological skill"" decided on the extent of the coal, they obtained a lease from the Crown Land Office of all the Mines in the Parish of St.

Martins, that they would discover and work. Having been thus far successful they returned to the Province with a few miners in June last, and commenced operations. They had however remained but a few days, when they all disappeared and have not been seen at this ""valuable mine"" since. But a few weeks have elapsed since a Boston paper gave a splendid account of this ""valuable Coal Mine"", ""American enterprise,"" and ""British liberality"". Several of the periodicals of the Province, and our own among the number, have quoted this account and thereby have excited much surprise in the bosoms of our countrymen. - Indeed it would be a shame to let brother Jonathan discover and work a rich coal mine on our shores, and by their ""geological skill"" obtain a prize of so much importance. But unfortunately for the folks in Portland, such is not the fact, and the writer in the Halifax Times need not attempt to defend the science and enterprise of the Nova Scotians and the New Brunswickers, for this discovery (the heaviest charge brought against them) is the most perfect hoax and speculating trick ever heard of. This coal was discovered upwards of twenty years ago, and the blacksmiths living near it have dug small quantities of the fuel from that time to the present. A gentleman now in this town visited the spot ten years ago and collected specimens of the coal and other minerals. So much for ""American discovery"". We understand that Dr. Gesner (who has communicated a geological survey of the Province), has just returned from St. Martins, and states that what was supposed to be a stratum of coal is nothing more than a collection of lignite which is not more than 9 inches thick, extends but a short distance in any direction, and it being unconnected with any regular coal field is perfectly worthless. So much for ""American science."" Our ""Enterprising Neighbours"" have suddenly abandoned the mine, having found out by digging a little into the cliff, that no fortunes were to be made there. 6 Perhaps before this goes to the press the lease will have been sold for thousands of dollars. We rejoice at the advancement of science and enterprise among any people, but we do not like to see the public imposed upon."

Codes: B6 / IDX_Names: St. Martins Coal;

S.J. Morning News - Oct. 28, 1839 A small coal vein has been discovered at Quaco; there is some differences of opinion, however, as to whether it is the ""rale geneuine,"" or only ""lignite""."

Royal Gazette - Oct. 30, 1839 We have to acknowledge the receipt of a bushel of what is termed Coal by our correspondent, but Lignite by others, from Quaco. A small collection of carbonaceous matter has been known to exist near the above village during the past twenty years. It has been examined by a gentleman in whom we have every confidence, and declared by him not to be a true coal vein, but, like others common on the coast, where fossil trees are seen, composed of lignite and common sandstone. Much has already been said on this subject, and if our friend at Quaco can send a small cargo of either Coal or Lignite, from the vein he has discovered, to this market, instead of a bushel, carefully packed in straw, he may depend upon our assistance to effect a sale for it, and a retraction of an opinion previously

S.J. Daily News - Jul. 27, 1875 Discovery of Coal. - Our correspondent at Tynemouth Creek writes of the discovery of coal which has been recently made at that place, and sends us a specimen of what has been taken from the mine. It bears some resemblance to Albert coal, is hard and apparently of an excellent quality. He says the mine has been discovered within a mile where the coal can be shipped. There is every facility for laying a track, with just enough down grade to make it easy to work. Your correspondent visited the mine, which is just being opened, and found by examination that the present seam as exposed to view is about four feet deep, and from the uniformity of the different layers of strata all about that region and the indications in all directions, your correspondent is of opinion that an immense coal bed underlies all that part extending downwards nearest the mouth of the creek, and probably miles up beyond the opening of the mine, and although Mr. Brown, on whose farm the mine is, is busily engaged, he has not penetrated far enough to make him reasonably expect good coal. Yet he has coal of a fair quality containing a great deal of gas. It burns clear and clean, and when we see that the quality is improving the deeper he goes, we can not only say the prospect is good, but very good. The land is already leased, and a company formed both able and ready to push the work forward, so that in a short time Tynemouth Creek will be better known by the outside world than ever it anticipated. Visitors are already coming to the mine, both ladies and gentlemen. Well furnished comfortable rooms can be obtained at a very low rate at Mr. R.L. Parker's with a host and hostess who know how to make visitors feel comfortable. No doubt many will visit the mine and satisfy themselves that we really have coal in St. John county."

Morning Freeman - Jul. 31, 1875 Coal Discovery. - A seam of what seems to be Anthracite coal has been discovered near Tynemouth Creek, about a mile from the water. The seam as far as has been discovered appears to be fully four feet thick. This, we hope, will prove to be a large deposit. Its proximity to the sea will greatly increase its value. The formation of the ground at the place is described as very remarkable. A great ridge some sixty feet in height and resembling an immense grave has been thrown up in a valley by some action of the earth's inner forces, and in this ridge the coal has

Daily Telegraph - Aug. 11, 1876 The Search for Coal at Tynemouth Creek. - The parties in charge of the Diamond steam borer now at work on Brown's land, Tynemouth Creek, St. John Co., have reached a depth of 175 feet, the most of it very hard rock. No coal has yet been reached. The borer is run day and night, and takes two men to attend it by day and the same by night. They talk of boring 1100 feet or less if they strike coal. The indications have long been considered

S.J. Globe - Jul. 31, 1879 A New Coal Field. - A sample of coal, resembling the Spring Hill coal, which came off the surface of a field owned by Mr. Archibald Parks, St. Martins, is on exhibition in Messrs. Troop & McLauchlin's office, Water street. Considering that it is only surface coal, it appears to be of excellent quality. Mr. Parks is anxious to have a sample

Chignecto Post - Aug. 10, 1882 A vein of bituminous coal, two feet in thickness, has been discovered at St. Martin's, N.B."

Kings County Record - Jun. 29, 1928 Coal Discovered Near St. Martins. - A coal discovery was made near St. Martins recently by James H. Black, Rural Route No. 1, who sent a small sample of the deposit to the Chateaugay Ore and Iron Company, Lyon Mt., N.Y., for analysis. The laboratory report, forwarded to Mr. Black, said that the analysis showed 63.02 percent carbon and 1.12 percent sulphur. As the sample weighed but one seventh of an ounce it was too small to make definite tests as to its physical properties. The pulverized sample was of a brownish, blackish color. The coal burned readily and left a decided brown ash. It did not burn with a sooty, yellow flame as bituminous coal. Its low carbon content was due to foreign rock matter. The coal is evidently a lean anthracite variety."

Codes: B6 / GEOL / IDX_Names: St. Martins Coal; Geology - General;
N.B. Courier - Jan. 14, 1843 (Copy) St. John, 22d December, 1842 Sir, - I have the honour to submit for His Excellency the Lieutenant Governor a Report, and to state that myselfand son have been engaged in exploring for coal with besthopes of success in the neighborhood of Gardner's Creek, and Ten Mile Creek, eastward of St. John. The early arrival of a deep fall of snow has prevented us from completing the exploration which must be deferred until Spring. I have not therefore thought it necessary to make a Report upon what has been done, as such a Report would be imperfect. I have, &c. (Signed) A. Gesner A. Reade, Esquire, &c. &c."

Codes: B6 / LEGI / IDX_Names: St. Martins Coal; Legislation, etc.;
Royal Gazette - Nov. 22, 1837 Public Notice ie hereby given, that a lease for fifty years of the Mines and Minerals, comprised within the Parish of St. Martin, in the County of Saint John, will be offered at public auction at the Crown Land Office, on Monday the 4th day of December next, subject to the following restrictions: 13Conditions and Restrictions. That the purchaser shall have two years to explore and select his Mining ground, and open any shaft or shafts; that after the expiration of the said two years, the purchaser will be confined to such mines only as he may have opened and worked, and shall then have in operation; and should it happen that during the said term of fifty years, any mine should not be worked for the space of twelve consecutive months, the said mine so remaining unworked, shall revert to the Crown, and that a per centage equal to one twentieth part of the produce of the mine, under the authority of the said lease, be exacted from and paid by the lessee or lessees, after the expiration of four years from the date of the sale or lease. Thos. Baillie, Comr. and Surv. Genl. Crown Lands. Crown Lands Office, November 7, 1837."

Codes: B7 / IDX_Names: Norton Albertite (see also Hampton U - URN 0697);
Kings County Record - Apr. 11, 1902 We understand that a lot of machinery to be placed in the new coal mine at or near Norton has reached St. John and will no doubt be placed in position at an early date and work of proving the values of the property proceeded with."

Weekly Record - Fri., Nov. 28, 1902 The development of the coal areas at or near Hampton will probably be continued during the winter. The management have in view the placing on the mine, a mining pump of very much larger capacity than the one now in use, and claims are made that the coal prospects are looking better every week as the work progress."

Kings County Record - Aug. 5, 1904 Central Norton. - Aug. 2. - Work has been resumed at the Central Norton Coal mine. A number of men are at work building a road to the mine under the supervision of Mr. Jas. Allaby. Others have commenced work in the pit. The owners are confident of success in the enterprise, and the hearts of the laboring men of the vicinity are filled with delight."

Kings County Record - Nov. 11, 1904 The coal company operating at or near Central Norton on which it is claimed a well defined body of anthracite coal has been discovered, is being developed regularly. The Nova Scotia papers are being used as a medium in which the sale of stock of the company is being vigorously boomed."

Kings County Record - Oct. 13, 1905 The indicators are that the vein of coal being prospected for near Central Norton, is likely to prove a well defined and workable deposit of anthracite coal. Much doubt has existed as to this matter in the past, but recent reports from a reliable source seem to point to its being a genuine anthracite deposit, but requiring still considerable development."

Dec. 12, 1910 - Copied from: Kings County Record - Dec. 12, 1940 30 Years Ago. - (Dec 16) - A report from Cromwell Hill near Norton is that an outcrop of Albertite has been located there. Albertite is solidified oil. It is known that the Albert shales extend to Norton, and it is possible that pockets of the valuable substance may be found there in paying quantities."
Kings County Record - Dec. 16, 1910 A report from Cromwell Hill, near Norton, that an outcrop of Albertite has been located there. This is the mineral that first attracted attention to the shales of Albert county. Albertite is solidified oil and was mined from pockets near Baltimore, Albert county, with great profit to the owners of the deposits. The solid oil was sold to New York parties who used it for producing gas and was the richest gas producing mineral ever discovered. The

Albert shales extend to Norton and it is just possible that pockets of the valuable substance may be found in paying quantities on the new location. A few years ago a discovery of hard coal was reported from the vicinity of Norton but it

Codes: B8 / IDX_Names: Dunsinane Coal;
Daily Telegraph - Jan. 26, 1864 A test of the gas-producing qualities of the recently discovered coal at Dunsinane, Parish of Havelock, was made last week by Robert Brittain, Esq., of the Gas Works, which showed 8,400 cubic feet per ton. We believe this is greater than any other coal in the Province, except the Albertite - [Exchange."

Codes: B8 / IDX_Names: Dunsinane Coal;
Daily Telegraph - Jul. 8, 1864 Dunsinane. - Mr. Editor: - Allow me to sketch Dunsinane. Such is the name of the locality, in which Mr. Shives Steam Saw Mill is situated, and as Steam Saw Mills don't very often ""happen"" in this part of Kings County, this particular one is considered to be quite an institution. Well, we -, that is something more than a score of the representatives of the youth and beauty of the locality where your humble correspondent resides - went to see it. A short but rapid drive brought us to Captain Hall's where we ""hauled up"" and, leaving horses and carriages, went the remaining three-fourths of a mile on foot, along a winding road that meanders its way, up the steep hillside to its summit and descends on the opposite side to Dunsinane. The scenery wasn't beautiful. Our road for the greater part of the way crossed by the skeleton shadows of giant pines blasted by the fires of previous years. But, Mr. Editor, if the scenery wasn't beautiful, we had an inexhaustible supply of Beauty along with us which more than supplied any local deficiencies. But, to the Mill. On the hillside, sloping northward to the Railway track, is a clearing in which are located the dwellings of the mill operatives, the Mill, and a huge pile of logs, sufficient we were told to keep ""her"" cutting at the rate of 10 to 12 M. per day of eleven hours until snow comes again. We had just arrived and were standing upon a great pile of deals close by the siding, listening to the ceaseless hum of the saws when along came the down train, sweeping noisily on its way, with its load of life and merchandise. The gallant driver, gently drew the rein and checked the speed of his iron steed and bowing politely to our company, passed swiftly on. Here were indubitable evidences of Progress. A very few years since and the spot on which we were now standing was untracked save by foot of wild beast or hunter. To-day, we see the iron way, o'er which the steam giant is drawing the rapid car - the electric telegraph conveying through many miles of uninhabited woods the messages of commerce and civilization, and - thanks to your enterprising fellow citizen - the steam mill making deals from the trunks of those grand old trees, which had tossed their branches in the gales that swept the world long ere the genesis of man had wrought the harness for the steam-horse, or compelled the lightning to be his messenger. Well, we were pleased with the mill. The machinery worked admirably. Especial attention was attracted to the large circular nearly five feet in diameter, which does the principal part of the cutting. That saw as it emerges from the end of the trunk of some ligaceous giant whose heart was molded centuries ago - seems to say ""I came, I saw, I conquered"" and can do it again! We saw it clearly. There was no saw dust in our 2 eyes, nor have we in our heart any wish sawft sawder the enterprising owner. Talk of bucksaws, ripsaws, jigsaws, handsaws, crosscut saws, sawsages (i.e. wise saws) - they were no where, sir, for ""of all the saws that ever we saw, we never saw a saw that would saw as that saw saws"". At a distance of a few hundred rods a number of men are engaged in sinking a shaft to test the depth and richness of the coal field, which is supposed to underlie this whole section of country, and hopes are entertained that the quantity will be sufficiently abundant to supply the whole province, and make of Dunsinane a second Newcastle. We sang God Save the Queen and went home, thinking of a beneficial sway of Her Majesty's ""petticoat Government"". We thought of the tremendous power of Beauty and steam - of bright eyes and circular saws, &c., &c., until your correspondent - (married) - thought he discovered among some of the crowd symptoms of that epidemic so prevalent on the Square in your city. All the ""cases"" are doing well however. Yours, &c., BUSH"

S.J. Morning Telegraph - Jan. 3, 1867 Dunsinane Coal. - A car load of coal from the new mine at Dunsinane, a few miles above Penobsquis Railway Station, was brought to Sussex by the train on Monday. - Parties who have used this coal informs us that it burns well, giving out a large amount of heat for the quantity consumed. It bids fair to come into general use. It is declared to be not inferior to the best English coal, and could be delivered in the City - if proper enterprise and sufficient capital were applied to its development - at a somewhat lower cost."

Weekly Record - Fri., Aug. 31, 1888 and Daily Times - Sep. 3, 1888 and S.J. Daily Sun - Sep. 3, 1888 A posse of men in the employ of Kilgour Shives commenced operations on the new seam of coal recently found about two miles north of his steam mill atDunsinane. The prospects of a valuable find of coal is very encouraging. The seam as first discovered being 17 inches in thickness and increases in width as it is bored to about three inches in every five feet. The people in this part of the county are greatly delighted at the prospect of having cheap coal in their own vicinity. Steam power and a borer are now on the premises in the vicinity of the find. A company has been formed and coal in large and paying quantities is being brought to the surface. The coal is said to be of fine quality."

Weekly Record - Fri., Feb. 3, 1888 It is rumored that the coal discovery at Shives' Mill, Dunsinane, is of considerable importance, but just how much of a seam has been explored we have not yet learned. A workable seam of good coal would prove a great boom to Sussex and the surrounding country."

Moncton Daily Transcript - Feb. 18, 1888 and Daily Times - Feb. 18, 1888 Rumors of an important coal discovery are incirculation at Sussex. It is said a workable deposit of coal is being developed at Shives' Mill, Dunsinane, on the line of the ICR."

S.J. Globe - Jan. 30, 1888 and S.J. Daily Sun - Jan. 30, 1888 A large deposit of coal has been discovered on Mr. Shive's property, on the parish of Cardwell, Kings County."

S.J. Daily Sun - Jan. 30, 1888 More Coal. - A large deposit of coal has been discovered on Mr. Shives' property, in the parish of Cardwell, Kings County. It is stated that the coal is of the very best quality, and that it can be easily brought to

Codes: B8 / IDX_Names: Dunsinane Coal;
S.J. Globe - Sep. 3, 1888 Coal in paying quantities is being found about two miles north of Dunsinane, Kings Co. Mr. K. Shives has a gang of men at work upon the seam."

Weekly Record - Fri. Sept. 28, 1888 We have already in several issues alluded to the vast undeveloped mineral resources of our county. We have lately had brought to our attention prominently and we may say pleasantly one source of wealth lying underground only awaiting the open sesame of the miners pick. We refer to the seam of coal out at Dunsinane, in Norton parish and other places. We lately had presented to us abarrel of coal from Dunsinane, which, though taken from the surface seam proved of excellent quality. The outcrop whence the coal was taken affords every indication that underneath there lies hidden a large and valuable deposit only awaiting development. Our local members induced the government last winter to provide in the estimates a sum to aid private parties in exploring for mines and minerals, and we are surprised that no one has yet availed themselves of the advantages thus offered by the government. If the owners of land giving indication of holding mineral wealth would unite with the government on such just and equitable terms in exploration which would result in the development of some valuable mine, the county would be enriched and the government would more than recoup itself through the royalty it would receive."

Weekly Record - Fri., Mar. 2, 1894 and Moncton Transcript - Mar. 5, 1894 A few years ago Mr. Kilgour Shives had some work done in the prospecting for coal at a point near the I.C.R. track at Dunsinane, Cardwell, Kings county. Mr. Shives raised a few barrels of coal, but did not proceed with any extensive operations, wishing to organize a company or sell to some one who would proceed to work on an extensive scale. There is now an expert examining the old pit, and from him we learn that the prospects for abundance of coal at this mine is very good, and he further says active operations will begin in a few months, as a company is organized and intend to push business."

S.J. Gazette - Mar. 5, 1894 Coal in Kings. - Mr. Ross, representing White &Co. of this city, has been in Sussex for a few days prospecting for coal at a point near the I.C.R. at Dunsinane, Kings County. To a Gazette man this morning Mr. Ross said the results so far were very satisfactory. That coal was there, he had proved, and also that it was of an excellent quality. The site is on the property formerly owned by Kilgour Shives, who attempted at one time to organize a company, but failed. The expert at present prospecting, is acting on the orders of a stirring financial concern, which intends pushing

Weekly Record - Fri., Feb. 1, 1895 The Dunsinane Mining Company is the name under which Messrs. John White, Robert Jardine, C.N.S. Skinner and Sherwood Skinner, of St. John, and Kilgour Shives, of Campbellton, are seeking incorporation. The company will have a capital of $50,000 in $5 shares, with offices and works at Dunsinane, a place about four miles above Penobsquis, in this county. It has long been known that coal was to be found in that locality, but as to whether it was in paying quantities or not has never been ascertained. It is probable that the company has been formed for the purpose of prospecting, and results are as satisfactory as are expected, it will be a very valuable property, as it is near
Progress - Feb. 2, 1895 The Dunsinane Mining Company of Dunsinane, King's county, is seeking incorporation with a capital of $50,000 in $5 shares. The promoters are Messrs. John White, Robert Jardine, Kilgour Shives, C.N. Skinner and Sherwood Skinner, and their purpose is to open and work a coal mine about two miles from Penobsquis, on land owned by Mr. Shives, where he had a mill some years ago."

Kings County News - Jul. 18, 1895 Sussex.- It is understood the work of developing the coal mine at Dunsinane will shortly be undertaken. There is every evidence to lead to the expenditure of a reasonable amount of capital to prove the existence or the non-existence of coal in paying quantities at this point. As it is only eight miles from Sussex, and near the I.C.R., it would be a great boon for this community if found in working quantities."

S.J. Gazette - Jul. 22, 1895 Coal Mining in Kings. - The Sussex Record is pleased to learn that steps are being taken to get out a quantity of coal from the vein or veins at Dunsinane and that the company formed some time ago, of which mention was made in the Record at the time, propose to make a systematic search and prove if possible the existence of working and paying seams in this locality. It is understood diamond drill borer will be utilized when operations of prospecting commence. Should a working body of coal be found here, it will, owing to its near proximity to the I.C. Railway, prove beyond question a paying venture, as the coal is said to be of a first class quality. The company is composed of good men who mean business, and we trust their efforts may be crowned with success."

Gazette - Oct. 24, 1895 New Coal Mine. - The new coal mine at Dunsinane, Kings Co., is thought to be very valuable. Two carloads of the coal has arrived in the city and tested with very satisfactory results. Mr. John White and gentlemen in this city are the interested people in this new venture."

St. Croix Courier - Oct. 7, 1897 The diamond drill owned by the New Brunswick government has been leased by John White, Kilgour Shives and Robert Jardine, representing themselves and others, to bore for coal at Dunsinane, Kings County. There have been favorable out croppings of coal in this vicinity and it is now proposed to search for the seams at

Codes: B8 / IDX_Names: Dunsinane Coal;

S.J. Daily Sun - Oct. 18, 1897 A diamond drill has arrived at Dunsinane to bore in the coal mine, if the seam is thick enough to pay for working. The company will start operations soon, as the coal is of a very fine quality - Sussex Record."

Weekly Record Fri., Oct. 22, 1897 The steam diamond drill belonging to the NewBrunswick government is being used in boring for coal at Dunsinane, a few miles above Penobsquis. The company organized some years age are the operators and have the machinery in charge of Mr. Edward Harrington and an assistant. They are now engaged in sinking a hole near the I.C.R. track and will go down about 500 feet. If they strike any promising veins they will follow up their search by boring near the Stone Brook nearer Penobsquis. It is to be hoped they may succeed in finding coal, which undoubtedly abounds in that locality, as it has been mined in small quantities and successfully used as fuel for years."

N.B. Reporter - Oct. 27, 1897 More Coal. - The steam diamond drill belonging to the New Brunswick government is being used in boring for coal at Dunsinane, a few miles above Penobsquis. The company organized some years ago are the operators and have the machinery in charge of Mr. Edward Harrington and an assistant. They are now engaged in sinking a hole near the I.C.R. track and will go down about 500 feet. If they strike any promising veins they will follow up their search by boring near the Stone Brook nearer Penobsquis."

Kings County News - Sep. 30, 1897 The diamond drill owned by the New Brunswick government has been leased by Messrs. John White, Kilgour Shives and Robert Jardine, representing themselves and others to bore for coal at Dunsinane, Kings County. There have been favourable outcroppings of coal in this vicinity and it is now proposed to search for the seams at lower depths. The drill has been boring for coal near Moncton since last spring and favorable indications met in several directions. It is possible the search will be resumed after the boring in Kings County is finished. Surveyor General Dunn was in Moncton on Saturday to arrange for the transfer of the drill from Westmorland to Kings County."

N.B. Reporter - Sep. 7, 1898 At Dunsinane, Kings County, borings have been prosecuted to a depth of 1,000 feet. A seam of coal thirteen inches in depth was struck at a depth of 200 feet. It is intended to go still further down."

Weekly Record - Fri., Mar. 8, 1901 Several carloads of coal have been mined at Dunsinane this winter and are now being put on the market. The Sussex Mercantile Co. has purchased a trial lot and expect it in in a few days. The coal is said to be of good quality and has been found in a seam four feet thick, which should pay to work. (Earlier article refers to coal and wood famine in Sussex)."

Weekly Record - Fri., Dec. 5, 1902 A promising seam of coal has been reported struck near Anagance on the line of the ICR. The mine is largely owned by St. John parties and Kilgour Shives, of Campbellton is said to be largely interested."

Weekly Record - Fri., Sep. 12, 1902 A reference to the mining applications in the Royal Gazette shows considerable activity in many parts of the province, as to mining claims and recently rights covering some ten square miles have been taken up on supposed coal areas in vicinity of Anagance, Kilgour Shives, of Campbellton, and Robt. Jardine, of St. John being the applicants."

Weekly Record - Fri., Oct. 23, 1903 The fact that coal from the Dunsinane mine has been shipped into Sussex, and sold to some of our citizens this season is interesting news, and would lead those not knowing the facts to understand that fuel belts in close proximity to Sussex may be opened up on a commercial scale in the near future, which would be a very desirable occurrence."

Weekly Record Fri., Jan. 31, 1908 Coal is now being mined at Dunsinane for domestic and other purposes. The coal taken out so far has proved of excellent quality and the owners are finding a ready market for it."

Weekly Record Fri., Mar. 20, 1908 We have learned that coal is being mined and sold for the Dunsinane coal mine but in just what quantity we cannot say. It would be a great boon to Sussex and vicinity to have this coal area opened up sufficiently to furnish a regular fuel supply."

Weekly Record - Jul. 9, 1911 On Saturday last Sheriff Freeze sold the Shives property at Dunsinane to George W. Fowler. The property is a large one and has within its limits the coal deposit which has been worked from time to time. There is also considerable lumber on the plot."

Codes: B8 / J8 / E2 / A2 / L4 / X1 / GEOL / IDX_Names: Dunsinane Coal; Albert Mines; Oil and Gas - Kings Co.; Albert / Kings County Oil Shales; Westmorland County Oil Shales; Grand Lake Coal; Geology - General;

Daily Telegraph - Aug. 21, 1866 Professor Bailey on the Coal of New Brunswick -No. 2. - In our last issue, we copied Professor Bailey's remarks on the true coal of this Province - the product of the Upper and Middle Coal Formation. At present we quote the Professor's statements relative to the Lower Coal Formation. The area occupied by rocks of this formation comprises from 3000 to 4000 square miles, and includes large portions of the Counties of King's, Albert, and Westmorland, with smaller areas in St. John, York, Queen's, Sunbury, Northumberland and Victoria. The rocks of the formation are thick and coarse conglomerates, with some sandstones, usually of a bright red color, and associated with large and valuable beds of limestone and gypsum; also grey and brown flags and shales, the latter very abundant and highly bituminous, passing into an important cannel coal, and associated with large and valuable deposits of asphalt or altered bitumen, and occasionally oil springs. Manganese ore, freestone, grindstones, &c. are among the more abundant and valuable products of the series.The formation under consideration underlies the productive coal measures, and is not known to contain any workable seams of true coal, unless the ""Dunsinane"" coal included in Table A be found to appertain to this series. The character of the formation, however, is not such as to forbid its occurrence, and as workable coal beds have been found in the same formation both in America and Europe, further exploration may yet lead to its discovery in this portion of the Continent. The most interesting and important mineral of the Lower Coal Formation in New Brunswick is that above termed Asphalt or altered bitumen, and locally known as Albertite. Formerly regarded as a true coal, and later as a variety of jet, it is now generally believed to have been originally a fluid mineral oil or petroleum, subsequently changed and solidified by chemical action. It is a black, brittle, lustrous mineral, breaking with a high conchoidal fracture, and differs from coal in its mode of occurrence, (in regular veins instead of beds), in its homogeneity, (being indivisible into layers and of one quality throughout,) as well as in its chemical composition and physical characters. It occupies an irregular and nearly vertical fissure in disturbed bituminous shales, has a varying thickness of from 1 inch or less to 17 feet, and has been mined to a depth of over 900 feet. From the original locality, discovered in 1849, large quantities of Albertite have been annually removed and exported from the Province. About one hundred men are usually employed in connection with the works, and several large engines (one of 400 horse power) are in constant operation. The mine is favorably situated, not more than six miles from the Bay of Fundy, with which it has been connected by a railway. The original deposit, above alluded to, is the only one of Albertite yet thoroughly tested, though other openings have been made, with more or less success, in the immediate vicinity. The very characteristic accompanying rocks have been traced over a large extent of country, and small veins of Albertite have been observed within this district at points distant from each other as much as fifty miles. The expectation may therefore be entertained that other and equally rich deposits will be discovered. This expectation is strengthened by the supposed origin of the Albertite as an altered Petroleum, by its geological position, which is the same as that of the oil wells of the United States, and by the actual occurrence of such wells upon a limited scale in the district under consideration. Several attempts have been made to open the latter, but as yet without profitable results. The Albertite has never been employed as a simple fuel. It is far better adapted to the manufacture of oil and gas, for which purposes it is unequalled by any other minerals known. The demand for the substance is in excess of the amount raised, but the Company refuse to extend their operations beyond 18,000 and 20,000 tons per annum. As another source of oil and gas, the bituminous shales above alluded to, and very extensively developed in the County of Albert, are beginning to acquire considerable economic importance. Numerous mining claims have recently been taken out for operations in this substance, both in the above named County and in that of Westmorland. In the latter work has been begun, and I am informed that 2000 tons were removed in the year 1865, and were shipped to the United States, selling in that market for $6 per ton. The cost of quarrying is said to about $1 1/4 to $1 1/2 per ton, and the freight to Boston, $1 1/2. In consequence, however, of the low price of mineral oils in the United States, it is considered necessary that the distillation of these shales should be carried on before exportation. For this purpose a Company on the Memramcook River are about erecting one hundred retorts, with which they expect to work up 100 tons of shale per diem. As a source of oil and gas, the Albertite far 11surpasses even the richest of the bituminous shales above described. The following are some facts, derived from reliable sources, bearing on this point. The mineral in the Albert mine is said to yield 100 gallons of crude oil per ton, or 14,500 cubic feet of gas, of superior illuminating powers, while in the latter case, where employed in connection with other coals, the residuum is a valuable coke. The yield of the bituminous shales is veryvariable, that of the best bed at the Caledonia mine in Albert being 7,500 per ton of gas, or 63 gallons of crude oil. That of the Westmorland Company above alluded to will yield only from 37 to 40 gallons, while other varieties contain a still smaller proportion. Moreover, unlike the Albert coal, the residuum of these shales is bulky and worthless. For comparison it may be stated that the Grand Lake coal will yield about 8,500 cubic feet ofgas per ton, but of a very inferior quality. From the Professor's tables we learn that in 1863 the Albert Mine produced 18,168 tons of Albertite, in '64, 19,463 tons, in '65, 18,658 tons - total in the three years, 56,289 tons. Of the total, 2,298 tons went to Nova Scotia, 4,520 tons to St. John, and the remainder to the United States. 2,260 tons came to St. John last year - double the quantity in '63 and '64. The value of the Albertite sent to the States, each of the last three years, has averaged about $150,000. The only coal mining property from which the Government obtains a Royalty is the Albert Mine, which paid to the Government in '63, '64 and '65, $8,089.29 Professor Bailey remarks that ""the trade on Coal and Mineral Oils, both of Export and Import, has been subject to great fluctuations, due in part to the great development of Petroleum Springs in the United States. In consequence of these fluctuations, expensive works have been constructed in the Province and again abandoned. The distillation of Bituminous

Shales promises to add within a few years very greatly to the Export Oil Trade of the Province.""""

Daily Telegraph - Aug. 21, 1866 Professor Bailey on the Coal of New Brunswick -No. 2. - In our last issue, we copied Professor Bailey's remarks on the true coal of this Province - the product of the Upper and Middle Coal Formation. At present we quote the Professor's statements relative to the Lower Coal Formation. The area occupied by rocks of this formation comprises from 3000 to 4000 square miles, and includes large portions of the Counties of King's, Albert, and Westmorland, with smaller areas in St. John, York, Queen's, Sunbury, Northumberland and Victoria. The rocks of the formation are thick and coarse conglomerates, with some sandstones, usually of a bright red color, and associated with large and valuable beds of limestone and gypsum; also grey and brown flags and shales, the latter very abundant and highly bituminous, passing into an important cannel coal, and associated with large and valuable deposits of asphalt or altered bitumen, and occasionally oil springs. Manganese ore, freestone, grindstones, &c. are among the more abundant and valuable products of the series.The formation under consideration underlies the productive coal measures, and is not known to contain any workable seams of true coal, unless the ""Dunsinane"" coal included in Table A be found to appertain to this series. The character of the formation, however, is not such as to forbid its occurrence, and as workable coal beds have been found in the same formation both in America and Europe, further exploration may yet lead to its discovery in this portion of the Continent. The most interesting and important mineral of the Lower Coal Formation in New Brunswick is that above termed Asphalt or altered bitumen, and locally known as Albertite. Formerly regarded as a true coal, and later as a variety of jet, it is now generally believed to have been originally a fluid mineral oil or petroleum, subsequently changed and solidified by chemical action. It is a black, brittle, lustrous mineral, breaking with a high conchoidal fracture, and differs from coal in its mode of occurrence, (in regular veins instead of beds), in its homogeneity, (being indivisible into layers and of one quality throughout,) as well as in its chemical composition and physical characters. It occupies an irregular and nearly vertical fissure in disturbed bituminous shales, has a varying thickness of from 1 inch or less to 17 feet, and has been mined to a depth of over 900 feet. From the original locality, discovered in 1849, large quantities of Albertite have been annually removed and exported from the Province. About one hundred men are usually employed in connection with the works, and several large engines (one of 400 horse power) are in constant operation. S.J. Daily Telegraph - Apr. 30, 1874 Elgin. - There is every prospect of a coal mine being opened at no distant day in the vicinity of Elgin. A company with a capital of $10,000 is now being incorporated, and the operation of boring will be commenced in the early part of the ensuing summer. Success to the enterprise."

Daily Telegraph - Aug. 25, 1874 Elgin. - ... there are in the neighborhood, about a mile distant from Elgin on the Goshen road, strong indications of coal, both in a peculiar gas and flavor contained in the well water, and in specimens which have been ploughed up on the surface. The seam is the one which had been traced from the Albert Mines to Quaco, and which we have already alluded to in our account of the Prosser Brook settlement. The spot has been examined by Prof. Bailey, the government geologist, and from what we can learn his opinion was a very favorable one. in consequence of this a company has been formed at Elgin to bore for Coal under the designation of the ""Elgin Mining Company,"" the president being F.W. Steeves, Esq.; secretary, R.D. Robinson, and treasurer, W. A. Colpitts; Dirctors, R.P. Eastman, J. Horsman, D.M. Steeves, W.P. Robinson, R.H. Goggins, J.D. Steeves. The company, however, has not yet commenced operations, the reason being that they were disappointed in the use of the government boring machine, which they were to have had this summer, but the promise, for some reason or other, has not yet been fulfilled."

Moncton Daily Times - Jan. 8, 1881 Discovery of Albertite, - We are informed that Albertite has been discovered in Albert County. - back of Elgin, and about half way between that place and Alma. - Globe."

Chignecto Post - Jan. 13, 1881 Albertite has been discovered back of Elgin, between that place and Alma."

Daily Times - Dec. 14, 1883 Albert Co. - Mr. E.B. Chandler has seven men atwork on a coal or Albertite lead in the Middle lands, about two miles from Elgin Corner. The prospects so far are promising."

S.J. Globe - Dec. 14, 1883 Mr. E.B. Chandler has seven men at work prospecting on a coal or albertite lead in the Middlelands, about two miles from Elgin Corner. The prospects so far are promising."

S.J. Daily News - Dec. 28, 1883 Reports are that there are good indications of albertite on the claim the Chandlers are working in Elgin."

Moncton Daily Transcript - Apr. 23, 1885 and Moncton Daily Times - Apr. 24, 1885 and Weekly Transcript - Apr. 29, 1885 Albert Co. - E.B. Chandler is now sinking a shaft where coal has been found on the Horseman farm, Elgin. Eight men are employed and success is almost certain."

Daily Telegraph - Aug. 1, 1885 Elgin. - E.B. Chandler's men at Mapleton have gone down to a depth of 112 feet. Last Friday a small amount of coal was brought to the surface. It is rumored operations will soon be commenced elsewhere."

Moncton Daily Times - Aug. 24, 1885 Albert Co. - Elgin Notes. - Mr. Chandler is still searching for Albertite in Elgin. He is now at work on Goggins' farm, with good prospects."

Chignecto Post - Feb. 19, 1885 and Moncton Daily Times - Feb. 21, 1885 Elgin:- The long and perservering search which Mr. Chandler had been making for the lost Albertite coal seems to have been at last rewarded with success. It is now over a year since he came to Elgin to search for coal and after making several tests at different places he at last began drilling on the farm of Mr. Samuel Harshman, about a quarter of a mile from Elgin Corner. The drill, which is worked by steam power, after penetrating sixty or seventy feet of shale and earth, began to bring up detached pieces of coal and has continued to do so at intervals to a depth of about one hundred and twenty feet, now reached. The coal, a piece of which, fresh from drilling, was giving your correspondent by Mr. Lemuel Black, who managed the drill, appears to be abundant and

Moncton Daily Transcript - Feb. 26, 1885 and Weekly Transcript - Mar. 4, 1885 Albert Maple Leaf. - E.B. Chandler has reached adepth of over 130 feet, with a drill, in his search for coal near Elgin Corner. Samples of coal taken from the drill last week are said to be genuine Albertite. This drill is worked by steam power. A man from Elgin said, Tuesday, that the drill has since bored through 60 feet of Albertite."

Codes: D4 / IDX_Names: Elgin Albertite;
Daily Telegraph - Jan. 17, 1885 Albertite. - It is rumored that Mr. E.B. Chandler, who is boring for albertite in Middlelands,

Elgin, has had the good luck to strike a lead of considerable thickness."

Moncton Daily Transcript - Jan. 22, 1885 and Weekly Transcript - Jan. 28, 1885 Albert Co. News. - (Albert Maple Leaf, Jan. 22) -A correspondent says that reports from the prospecting operations now being carried on at Midland, Elgin, are very promising. A lead of Albertite, about a foot in thickness, has been cut through and they are daily expecting to strike a vein. A good strike would be a big thing for the county and we wish the enterprise the success it deserves."

Moncton Daily Times - Jun. 8, 1885 Albert Co. - Encouraging. - E.B. Chandler, Esq.,has eight men employed in sinking a shaft for coal, on the Fitzgerald property in Elgin. They have already attained a depth of 35 feet, and consider the prospects very encouraging. - Observer."

Moncton Daily Transcript - Mar. 5, 1885 and Moncton Daily Times - Mar. 6, 1885 and Weekly Transcript - Mar. 11, 1885 (Albert Maple Leaf, Mar. 5) - It is said that acoal mine has at last been found on the farm of Solomon Horseman, Elgin. E.B. Chandler's men sank a hole to a depth of 120 feet, when the drill, for some unascertained cause, would not go any further, which necessitates the drilling of a new hole. No one knows how much coal there really is or what depth the drill went through. Some say that several pockets or leads have been gone through, others say that it was all one pocket of coal. At least we believe it is generally conceded that the drill went through coal and shale the whole distance from the

Moncton Daily Transcript - Sep. 8, 1885 Dorchester - E.B. Chandler, Esq., is in town. Itis reported that he has found Albertite coal in quantity at Elgin, Albert Co. We congratulate him upon his success. He has worked for it and deserves it."

Codes: D4 / E2 / IDX_Names: Elgin Albertite; Oil and Gas - Kings Co.;
Weekly Record - Fri., Dec. 19, 1902 An Elgin, Albert Co., correspondent writes:'There are rumors that there will be some operators here looking for oil in the near future. Years ago shafts were sunk for coal but nothing found. Now it is supposed that the oil sands lie under the shale strata. The coal shafts were sunk about 100 feet but it is proposed to put the drill down about 300 feet.'"

Codes: D4 / K3 / IDX_Names: Elgin Albertite; Mapleton Albertite;
Daily Telegraph - Aug. 31, 1876 Boring for Albertite. - The diamond borer has been at work on or near Mr. Frederick Steeve's property, a short distance to the west of Elgin Corner. Mr. Ells, of the Geological Survey of Canada, having inspected thelocality found it unfavorable, and, on consultation, it was determined to bore in Mapleton, a charming valley, two miles north of Elgin Corner. It is bounded by high hills, and is of an elongated oval form. The sides of these hills are covered by hardwood of various kinds, among which maple predominates through the centre of the valley, which, at its widest point, is from a quarter to a half mile wide. There flows through it a stream of clear and sparkling water. The meadows which border it, by their intense greenness, shew the fertility of the soil. The rock underlying the valley proper is composed of oil shale, which burns readily, and which has a greasy feel when rubbed between the fingers. Some years since, after a chopping made in this valley had been fired, these shales got on fire and burnt for a period of two months. They were only extinguished by winter's storms and rains. We are informed that at either extremity of this valley the interstices of the shales are filled by albertite. It is said that the borings in this valley are to be done diagonally, thus, as the veins of albertite are nearly vertical, affording more opportunities of striking them if any such exist than there would be from perpendicular borings."

1860 - Copied from: The Story of Sussex and Vicinity, by Grace Aiton, 1967, p. 139 A group of 28 businessmen subscribed £5 each for a share in a newspaper to be called ""The Sussex Times"". It began publication in March of 1860 as a four page sheet, was reduced to half size and after 16 issues ceased to exist. ... ""The notice of a ""Farm for Sale"" along Ward's Creek Road contains the information that Dr. Gesner, in his geological survey of the province, found a vein of coal ""upon the farm of Allan Sheck in the parish of Sussex, of three feet in thickness and have no doubt that it exists in greater quantity and purer at greater depth."""

N.B. Courier - May 19, 1860 ADVERTISEMENT: Valuable Farm At Sussex Vale. For Sale by private bargain:-The subscriber offers at Private Sale that valuable Farm known as the Belling Farm situate on Ward's Creek, in the Parish of Sussex, adjoining the Farm and Residence of T.O. Arnold, Esq., and about 20 minutes walk from the railroad station at Sussex Vale or 1 3/4 miles. Said Farm contains One Hundred and Forty nine acres of as good Land as is to be found in the County of Kings, has a front of about 90 rods on the Ward's Creek road, and runs to the old Cumberland Road in the rear, has 20 acres intervale Land beautifully interspersed with fine Elm Trees of large growth, and intersected by the stream known as Ward's Creek, 30 acres high land cleared and ready for cultivation, and about 70 acres of fine growth wood Land, in which, and quite accessible is about 2 acres of Swamp, much of which is very valuable for the compost heap. Also - a small Farm house, and good barns, quite new, as well as good fences. There is also on the Farm a Vein of Coal,supposed to be a continuance of the same deposits found in Albert County which was discovered by Dr. Gesner during his Geological Survey of the Province, and reported of by him in his report to Government as follows:- ""I discovered upon the farm of Allan Sheek, in the Parish of Sussex, a vein of Cannel Coal 3 feet in thickness, and have no doubt that it exists in greater quantity and purer quality at a greater depth. The above would no doubt upon being worked become very valuable."" The subscriber having purchased a smaller Farm offers the above for sale on very easy terms of payment with possession when required. Application can be made at Sussex to T.O. Arnold, Esq., from whom every information can be obtained, or in St. John, to the subscriber, James A. Whitney, St. John, 12th May, 1860."

Morning News - Sep. 26, 1862 and S. J. Daily Globe - Sep. 26, 1862 and Morning Freeman - Sep. 27, 1862 and Carleton

County Sentinel - Oct 4, 1862 Sussex Mines. - The ""News"" has learned from the Sussex ""Mines"", that a hole has been dug some twelve feet in depth, and that a horizontal vein of beautiful coal, some nineteen inches broad, has been found, and other veins are apparent. The prospects are as encouraging as they were on the first discovery; and in short time we expect to be able to write more positively."

S.J. Daily News - Jun. 17, 1864 The editor of the GLOBE has been shown a specimen of bituminous coal, gathered in the vicinity of the dwelling of Rev. H. Charlton, Belleisle. It was found loose upon the surface."

Morning Journal - Jun. 2, 1869 Important Discovery in King's County. - We are informed by a correspondent that a kind of coal, or bituminous shale, has been found on the farm of Mr. Henry Baxter, of Norton, King's County. It has been tested, and found well adapted for the manufacture of oil. Those who have examined the spot say that there is any quantity there, and Mr. Baxter has been offered a thousand dollars for the right of mining. This offer has been refused, and is now negotiating with a Company for a lease for a term of years. The indications are that we are safe in congratulating Mr. Baxter on his good fortune. We may add that the fortunate owner of this mine is a young man still in a state of ""single

S.J. Daily News - Jun. 30, 1869 The Globe says ""another coal discovery has been made on the farm of Mr. Smith, near Bloomfield Station. It is supposed to be a continuation of the vein which has been exposed on Mr. Baxter's property, at Norton, about two miles distant from Mr. Smith's."

S.J. Daily Telegraph - Jun. 9, 1879 Sussex. - Coal. - Mr. Warden Markham et al., are energetically prosecuting their search for coal on the South Branch, with reasonable hopes of success. It is hoped that their enterprise will be rewarded."

Moncton Daily Times - Jun. 9, 1879 Kings County Coal. - Parties in Kings County are said to be energetically prosecuting their search for coal on the South Branch, and with reasonable hope of success."

S.J. Globe - May 2, 1879 Coal. - A correspondent at Goshen, K.C., informs us that a large quantity of shale has been found on the farm of Mr. James Hayward, and that there are good prospects for coal. A miner visited the place three years ago, and found a piece of shale, and he said if he could find plenty of it he could find plenty of coal. Abundance of shale has since been found. Mr. Hayward will furnish any particulars required."

S.J. Daily Sun - May 13, 1879 and Moncton Daily Times - May 14, 1879 Coal in King's County. - The coal discovered on George Teakles' farm, near the paper mills, Penobsquis, is said to be of the best quality, and similar to the Albert Mines

Codes: D7 / IDX_Names: Kings County Coal;
Moncton Daily Times - Mar. 14, 1885 Albertite at Apohaqui. - Apohaqui, March 11. -For many years it has been known that coal was to be found underlying the farm now owned and occupied by Joseph Ricker, and situated about half a mile west of the Apohaqui station. The farm fronts on the south side of the Kennebecasis, and is crossed by the I.C.R., which here runs parallel with and quite near the stream. The land rises quite abruptly from the river and necessitated a deep cutting for the railway. It was probably while excavating for the railway that the coal was first discovered. It is of the kind commonly known as Albertite. Whether it is to be found in paying quantities or not is likely soon to be tested. E.B. Chandler has been negotiating with Mr. Ricker and with A.B. Sproul, the owner of the adjoining farm and it is understood, will with others begin operations when the spring opens. It is to be hoped the venture will prove successful. A gentleman who tested a sample of the coal some years ago believes it to be of good quality. Apohaqui is naturally excited over the possibility of a boom for

Daily Telegraph - Jun. 12, 1886 Sussex. - The find of coal by Mr. F.W. Stockton, in this county, promises, it is said, to be quite extensive, and the coal of a first class quality and quite near the surface."

Gazette - Sep. 28, 1897 Coal in Kings County. - The diamond drill owned by the New Brunswick government has been leased by Messrs. John White, Kilgour Shives and Robert Jardine, representing themselves and others to bore for coal at Dunsinane, Kings County. There have been favorable outcroppings of coal in this vicinity and it is now proposed to search for the seams at lower depths. The drill has been boring for coal near Moncton since last spring and favorable indications met in several directions. It is possible the search will be resumed after the boring in King's county is finished. Surveyor General Dunn was in Moncton on Saturday to arrange for the transfer of the drill from Westmorland to Kings county."

Daily Telegraph - Aug. 6, 1898 Hard Coal in New Brunswick. - Much interest has been aroused in the county of King's by the discovery of a vein of anthracite in the parish of Norton. It comes to the surface on the side of a hill and is about two feet in thickness. There are also indications of a much larger vein beneath the one which crops out. A St. John gentleman, who has been in the locality, brought some specimens of this coal to the city the other day, which he had taken from the vein with his own hands. The coal is apparently of a high grade and resembles the best quality of Pennsylvania anthracite. It has been analyzed by an expert in the United States, and the report on it is so satisfactory that the company which owns the area proposes to sink a shaft and if a sufficient quantity is found will open a mine. The whole business is in the hands of an American company which has quietly bought up all the land in which the coal is deposited."

S.J. Globe - Aug. 6, 1898 Anthracite Coal Mining. - St. John Man Tells an Interesting Story. - A prominent merchant and capitalist this morning discussing with a Globe reporter the reported discovery of anthracite coal at or near Norton said the news might be true, but he was afraid it was too good news. Said the merchant: I once owned an anthracite coal mine at Norton and for a few hours had visions of a big fortune and would have demanded somewhere in the vicinity of half a million for my claim. Continuing the merchant said that one night some years ago, a farmer called on him and from his bulging pockets produced what seemed to be as fine anthracite coal as ever was seen. Some of it when thrown on a fire burned freely and the merchant admitted that visions of wealth floated through his brain while the farmer told how he had found this while searching for his cows, and said he was beneath the roots of an old tree that had been blown over. The capitalist secured some dynamite and a few tools and in company with the farmer started for the place. They went by night, so that nobody would know their mission, and in the grey of the morning stood around the mine and set off the blast which destroyed several bushels of the stuff. This they gathered up and the way it shone convinced them that a fortune was a sure thing for them. On the first train they returned to the city, carefully hid away the stuff and then secured a legal option on the property. This done they called in Mr. George F. Matthew, the well known geologist, and triumphantly submitted their find to him for an expert opinion. That, said Mr. Matthew, is about as fine a specimen of shale as I ever saw, and then he proceeded to tell his inquisitors that they found it at Norton and indicated within ten feet the exact spot from which it was taken. The merchant was inclined to the opinion that the new mine was at or near the same place and believed the disappointment of the finders would be as keen as was his, although he admitted it might be that coal had really been found."

Weekly Record - Fri., Oct. 12, 1900 A seam of coal together with a shale heavily freighted with petroleum oil, is reported to have been found in McCain Settlement, four and a half miles from Sussex.- SUN"

Kings County Record - Feb. 7, 1902 Editorial. - In our local column will be seen an account of a proposed company to work Anthracite coal mines at or near Norton in this county. It will be news to New Brunswickers that valuable Anthracite coal veins are in evidence, and they do not know it. It is about time some of these transparent frauds were punctured, and a stop put to victimizing outside capitalists. Recently a concern has been flooding New York city with glowing accounts of large bodies of 'Cannel Coal' in Westmorland, and Albert counties, and the dollars are being raked in on the same. The calling of ordinary shales as Albertite shales, 'Cannel Coal' and 'Anthracite' may be all very well for promoters, but it is nevertheless getting money under false pretences. The press of New Brunswick should expose these schemes thoroughly, and we further think the Government of the Province, would be justified in assisting in the work, as these misrepresentations can only in due season, have a tendency to prevent legitimate capital coming into the Province, once investors find out they are being systematically fleeced."

Codes: D7 / IDX_Names: Kings County Coal;

Weekly Record - Fri., Apr. 24, 1903 What has become of the great anthracite coal mine near Lower Norton of which we heard considerable last summer? We should like much to see it in active operation and the valuable anthracite put in the market the coming season, so as to offset having to pay such high prices for the American product."

Weekly Record - Fri., Feb. 13, 1903 Kings County Hard Coal. - Portland Press: Ex- Alderman E.E. Rounds, who has been for the last few days at Central Norton, N.B., investigating a coal outcropping there, will ship his first consignment of specimen coal Saturday. Mr. Rounds will ship about ten tons. Beyond the fact that he will make his first shipment of coal Saturday nothing is known here of the extent of his operations, but the short time he was on the ground would indicate that he found coal near the surface. The Hampton correspondent of the Sun writes: The prospecting coal company at Norton have some twelve or fourteen men mining coal from the thirty-five foot excavation, and teams hauling it here for shipment to Portland, forty tons having been ordered by capitalists as a test of its quality and value, which, if satisfactory, will result in the formation of a working company with a capital of $150,000. The coal is equal to the finest Lehigh, and the expert miners on the ground say the outlook is excellent for the existence of areas of paying quantities."

Weekly Record - Fri., Feb. 13, 1903 That Kings County Coal Mine. - On the eighth page of this week's Record will be seen a clipping from the Portland, (Me.) Argus in reference to the Norton Coal Mine. The following further reference to this mine is taken from the same paper: Edgar E. Rounds, coal miner, returned early yesterday morning from his possessions at Central Norton, N.B., with ten tons of coal in his possession and with the conviction that the coal deposits in that section are valuable and that there are enough of them to amount to something. Mr. Rounds says he is not going back at present, but he is satisfied that the coal he has found is the real thing and that there is more of it. He speaks well of the people in the section in which he has been sojourning, but does not think much of the railway management. Trains are late all the time and the rules and regulations are something peculiar. Inasmuch as Mr. Rounds has had some little experience on railroads his opinions on this point may be taken as that of an expert. Mr. Rounds had some of his coal at the police station last evening and it certainly looks well, burns well and does not smell bad, being a sort of hard cannel coal."

Kings County Record - Jun. 3, 1910 The existence of coal not a thousand miles from Sussex will be investigated at an early day and should it prove worthy of development the means to develop same will be forthcoming promptly. Kings County seems to be most prolific in surface indications of valuable minerals."

Kings County Record - Jun. 17, 1910 We understand that some parties are engaged in testing or opening up a coal area back of Anagance Station, but with what success is not at present known. It would be a great boon to have a good producing coal mine in this section of the country."

Kings County Record - Aug. 2, 1912 Active Coal Boring Operations. - Gang of Men are Busy Prospecting the Mount Middleton Deposits. - The investigation of the coal deposits at Mt. Middleton is now being actively pushed. Early this week a boring outfit was taken from Sussex to the scene of the operations and while the bad weather has prevented the prospectors from making as much progress as those interested would like to see, a start has been made and the location of the coal seams will be determined as rapidly as possible. The man in charge of the operations is W.F. Mullins, Montreal. Alexander Kent has the contract for boring and has a large gang of men on the ground. The first work is being done on a wood lot owned by Joseph Hornbrook on the Mill Brook, midway between Mt. Middleton and Berwick. A leading representative of the Montreal capitalists behind the development is expected here within a few days to look over the ground and a final decision will then be reached as to the extent of the work to be carried on. The present indications are that an exhaustive investigation of the whole area will be made. At the point where the first hole is being sunk there is a marked outcrop of shale, and fire-clay, as well as other indication of coal. During the next few weeks there will be considerable activity manifested in the vicinity of Mt. Middleton."

Kings County Record - Aug. 23, 1912 Active boring operations have been temporarily suspended at the Mt. Middleton coal fields, owing to the illness of the expert in charge. Mr. Kent has gone to Moncton for a few days to recuperate but will resume work as soon as possible."

Kings County Record - Aug. 30, 1912 The work of boring for coal at Mount Middleton is being pushed forward and operations are progressing favorably. In addition to the work being done by the boring gang, a shaft was sunk down the Mill Brook, about two miles from where the machine is operating. Water interfered with the work but at fifteen feet some good shale was struck and some specimens resembling Albertite were found. The water drove the workmen from the site, however, and they are now working on higher ground, where a second shaft will be put down. So far those interested have every reason to feel satisfied with the outlook."

S.J. Standard - Aug. 30, 1912 Coal In Kings county. - The work of boring for coal at Mount Middleton is being pushed forward and operations are progressing favorably. In addition to the work being done by the boring gang, a shaft was sunk down the Mill Brook, about two miles from where the machine is operating. Water interfered with the work, but at fifteen feet some good shale was struck and some specimens of a high grade coal, somewhat resembling Albertite, were found. The water drove the workmen from the site, however, and they are now working on higher ground, where a second shaft will

Codes: D7 / IDX_Names: Kings County Coal;

Kings County Record - Jul. 31, 1941 Coal Being Mined In Waterford Area. - According to latest reports from the scene of activity, the coal 'find' at Urney, Parish of Waterford, is developing very favorably; and it is expected that in six weeks' time the mine will be producing coal in abundance. This 'strike' of coal was made on the farm of William Law at Urney some months ago, and was thought sufficiently good to warrant further investigation; and Robert Hawkes, who has had a great deal of experience in coal mining work, has, he told The Record, obtained the coal rights on the 160 acres of land. He states that the coal is similar to that found in Nova Scotia. It runs, he continued, in a 'pitching seam' at an angle of 45 degrees. Mr. Hawkes has sent samples of this coal to technicians in Montreal; and it has been given a standing of 16,000

T.B.U. (British heat units). It is stated that there is just a little over three per cent ash. A number of miners from the Queens county districts are at work on the property. Mr. Hawkes expects to establish a yard at Sussex, which will be only eight miles from the mine. He will also take up residence in town, he says. What with manganese, and now coal, Kings county seems to be one of the rich spots of the province, as the dairying and lumbering industries have long been highly valuable assets. The 'black diamond' may now add its quota to the county prosperity!"

Kings County Record - Jul. 28, 1960 The First Newspaper. - ... The Sussex Times -July ?? 1860 ... The notice of a farm sale along Ward's Creek contains information that Dr. Gesner in his geological survey of the province had found a vein of Cannel coal 'upon the farm of Allan Sheck in the parish of Sussex, of three feet in thickness, and have no doubt that it exists in greater quantity and purer quality at greater depth.'"
The Story of Sussex and Vicinity, by Grace Aiton, 1967, p. 139 A group of 28 businessmen subscribed œ5 each for a share in a newspaper to be called 'The Sussex Times'. It began publication in March of 1860 as a four page sheet, was reduced to half size and after 16 issues ceased to exist. ... 'The notice of a 'Farm for Sale' along Ward's Creek Road contains the information that Dr. Gesner, in his geological survey of the province, found a vein of coal 'upon the farm of Allan Sheck in the parish of Sussex, of three feet in thickness and have no doubt that it exists in greater quantity andpurer

Codes: D7 / B8 / IDX_Names: Kings County Coal; Dunsinane Coal;
Kings County Record - Jul. 12, 1912 and S.J. Globe - Jul. 19, 1912 Promise Coal Development Here. - Outside Capitalists Said to Have an Eye on Kings County Coal. - Representatives of large financial interests were here this week investigating the coal deposits of the county. A number of property holders in the vicinity of Mount Middleton were approached and asked for leases of their real estate holdings, with options to purchase at the end of three years. For many years it has been known that coal deposits were to be found in Kings and at Dunsinane operations have been carried on spasmodically for some years. The activity in the Minto mines has attracted attention to the New Brunswick coal fields and it looks now as if new sources of supply would be opened up. The Record was shown some samples of coal found in the vicinity of Mount Middleton and they leave no doubt as to the existence of coal there. How large the quantities are will have to be determined by practical demonstration. If satisfactory arrangements can be made with the property holders in the neighborhood of the ground examined, it is proposed by the capitalists interested to use diamond drills, in order to ascertain more definitely the amount of fuel available. If the investigation justifies further action the areas will be acquired by those interested and permanent development will be commenced. While the coal is at present isolated, a discovery of large deposits would doubtless mean the construction of a railway through the district. Several of those interested have agreed to lease their lands and permit the work of investigation to proceed. The late E.N. Sharpe, who was one of the men who helped to develop the coal mines of Springhill, N.S., was a firm believer in Kings county coal deposits and at one time he was about to give the matter serious consideration, when he was called to Nova Scotia. The work there occupied his attention up to the time of his death. There is no doubt as to the Mount Middleton outcrop being part of the Minto range, which runs across the counties of Queens and Kings. While it is too early to say anything definite concerning the probable outcome of the movement, it is encouraging to find that outsiders are interesting themselves financially in the venture."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Weekly Observer - Jan. 7, 1851Naptha Springs, New Brunswick. - We understand that springs of Naptha have recently been found at Hillsboro' New Brunswick, in the vicinity of the asphaltum deposits in that quarter. The naptha floats on the surface of water and resembles this tar, or oil, and when lighted burns with a brilliant flame. Petroleum, of the consistence of soft wax, is also dug from the earth on the borders of the Petitcodiac River, in the county of Westmorland. The water of a well in that district contains so much naptha as to render it unfit for domestic uses, and some of the springs it is said discharge a gas, that is inflammable, and resembles in character the common illuminating gas. - Halifax Guardian."

Morning News - Apr. 7, 1856 ADVERTISEMENT: New Brunswick Oil Works Company. Public Notice. Pursuant to the powers vested in me in and by the Act of the General Assembly of the Province of New Brunswick entitled ""An Act to incorporate the New Brunswick Oil works Company,"" I do hereby call the first meeting of the said Corporation for the organization thereof, to be held on Tuesday the twenty-ninth day of April next, at the hour of ten of the clock in the forenoon of that day at the office of McGrath, Harding & Co., situate at No. 77 Prince Wm. Street, in the city of St. John. James DeW. Spurr. Dated this 27th day of March, 1856."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Morning Freeman - Aug. 10, 1858 Fatal Accidents. - On Friday evening a man named Mitchell lost his life at the New Brunswick Oil Works. It was his duty to clean out the retorts, &c., after the process of distillation had ceased, and it is supposed that in haste to get away he went in before the gas had escaped, and without taking the precautions prescribed, and that he was suffocated."

New Brunswicker - May 14, 1859 Recently a deposit of Asphaltum was discovered in Albert County, and at the last sitting of the Legislature a charter was obtained and a Company formed under the name of the ""Caledonia Mining and Manufacturing Company,"" for the purpose of working the mine, which is said to be one of great value, and we trust that it may prove so, even beyond the most sanguine hopes of those connected with the enterprise. Our country is rich in minerals, and the men who have the spirit to search for them are deserving of public gratitude. Asphaltum is one of the most valuable of minerals, and must become a great source of wealth to the Province. We learn from the Westmorland Times that at a meeting of the shareholders in the Caledonia Mining and Manufacturing Company held at King's Hotel, Moncton, on Monday, 9th inst., the following gentlemen were elected Directors of the Company:- Hon. E.B. Chandler, A.E. Botsford, W.H. Steves, O. Jones, Edward Allison, Esquires. John H. Harding, Alexander Wright, And subsequently, O.

N.B. Courier - Apr. 14, 1860 and Morning Freeman - Apr. 28, 1860 and Morning News - Jun. 4, 1860 ADVERTISEMENT: Thomas McHenry, Stock and Real Estate Broker, No. 33, Prince Wm. Street, (Office, N.B. Oil Works Company,) St. John, N.B."

Morning Freeman - Aug. 20, 1861 Advertisement: Oil Manufactory - By Auction. To be sold at Public Auction on Thursday, the 5th day of September next, at 12 o'clock in the forenoon, at Chubb's Corner, in the City of Saint John - Certain lease hold LANDS and PREMISES, situate in the Parish of Lancaster, known as the NEW BRUNSWICK OIL WORKS, held by the Subscribers as Trustees of the New Brunswick Oil Company. On said premises there is a large Three Story Brick Building, containing a Steam Engine, Retorts, Stills, Condensers, &c., and everything necessary for carrying on a large Oil Manufacturing Business. There are also on the premises a large Cooperage, together with a large quantity of new and second hand Barrels, Heavy Oil and Paraffine; Scows and Weighing Scales; also, one New Flue Boiler 22 1/2 feet long by 5 1/2 feet diameter. Terms of payment made known at sale. W.H. Scovil } Geo. E. Snider } Trustees W. Girvan } St. John,

N.B. Courier - Nov. 22, 1862 N.B. Oil Works vs. J.H. & G. Harding. - This was an action to recover the amount of an amount alleged to be due by the defendants to the Company. The defence was the oils were purchased by J.H. Harding for the purpose of introducing them into the different towns in the Gulf ports to raise funds for the Company's relief. The Company owed J.H. Harding £207 18s., by virtue of an award in his favour, and the purchase of the goods for which this action was brought was a personal transaction, and not of the firm. The Company alleged that the defendants were their debtors and not J.H. Harding, who, by a resolution passed by the Board, proposed to pay the account of the firm. The N.B. Oil Works Company had transferred all their property and effects, except their book debts to Trustees for the benefit of all their creditors, except certain preference creditors who were to be paid in full. The book debts were not assigned. The proceeds enabled the Trustees to declare a Dividend of 1s. in the pound. The Company were willing to allow J.H. Harding to offset a claim of fifty pounds incurred for Capt. Chute, who was sent by J.H. Harding to St. Stephens to the sale of the oil there, and for the remaining £157 2 he should get 3s. in the pound from the Trustees. But they claimed that the firm must pay the account in full. This was a part of the reserved book debts and did not go to Trustees. Verdict for the plaintiffs £207. Counsel for Plaintiffs, Hon. J.H. Gray, Q.C.; for Defendants, S.R. Thomson, Esq. - Communicated."
Morning Freeman - Nov. 22, 1862 N.B. Oil Works vs. H.H. & J. Harding. - This was an action to recover the amount of an account to be due by the defendants to the company. The defence was that the company owed J.H. Harding £207 by virtue of an award in his favour, and that the goods, &c., for the value of which this action was brought, were really given by the company to J.H. Harding. The company alleged that the defendants were their debtors, and not J.H. Harding, who, they said, had even himself made a proposition for settlement of this account in the name of the firm. The Oil Works Company had transferred all their property and effects, except their book debts, to Trustees for the benefit of all their creditors, who were to be paid in full. The proceeds enabled the Trustees to declare a dividend of four shillings in the pound. The company were willing to allow J.H. Harding to offset by his claim an account of £50 the company had against him, and that on the remaining £157 he should get 4s. in the pound from the Trustees; but they claimed in the interest of all the creditors that his firm must pay their account in full 20s. to the pound. Verdict for the Plaintiffs £207. Counsel for Plaintiffs, Hon. J.H. Gray, Q.C.; for Defendants, S.R. Thomson, Esq."

S.J. Morning Freeman - Jan. 7, 1864 We are glad to see indications of enterprise in opening the vast internal resources of the County of Albert. One company has commenced boring for oil on an extensive scale, and a steam engine has been forwarded from this city to aid this hopeful work. - Christian Visitor."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Morning Freeman - Jun. 4, 1868 The Oil Works - We regret much to hear that owing to the operation of the Excise on Petroleum, and its relations to the Customs' duty, the Oil Works have been obliged to suspend operations. There have been generally about 300 persons, young and old, supported by this manufacture. We trust that some way of resuscitating it may ere long be devised. - The foreign will now drive the local oil out of the market. - Journal. This is decidedly bad news. The immediate cause of this suspension the Journal admits to be the recent change in the imposition of duties, from which the Journal and its associates expected such great benefits. The Government and Parliament of the Dominion appear to be able to do nothing of any importance in this Province to please friends or foes."

Daily Telegraph - Jun. 18, 1868 Oil Contract. - We understand that the contract for supplying the Light-Houses of Ontario and Quebec with Oil has been awarded to the New Brunswick Oil Works Company of this City. In a few days, Mr. Moore, the clever manager of the Works, will leave for Montreal with 900 barrels (about 8,000 gallons), in fulfilment of the Company's engagements. The rate paid, we believe, is not excessive, but will leave a small margin for profit."

Morning Freeman - Jun. 20, 1868 Oil Contract. - We understand that the contract for supplying the Light Houses of Ontario and Quebec has been awarded to the New Brunswick Oil Works Company of this city. In a few days Mr. Moore, the clever manager of the Works, will leave for Montreal with 200 barrels (about 8,000 gallons) in fulfillment of the Company's arrangements. The rate paid, we believe, is not excessive, but will leave a small margin of profit. - Telegraph. This is a small atonement for the injury done by the imposition of the Excise duty."

Miramichi Gleaner - Oct. 4, 1873 We learn from our changes that indications of oil have been discovered at Stiles' mine, a coal property situated seven miles from Amherst, on which Messrs. I.S. Hickman, E.N. Sharp, Magee Brothers, and Hall & Fairweather, of St. John, and others, are interested."

S.J. Daily Telegraph - Oct. 30, 1874 Oil has been discovered near Hopewell Hill."

Chignecto Post - Dec. 4, 1879 Oil Prospecting.- Some thirteen years ago, an oilwell was sunk on the farm of Mr. ... Como, near the Memramcook College, but the machinery not being sufficient for the purpose, the work was abandoned. Oil, however, to the extent of about twenty gallons per year exudes from the well and is sold for lubricating purposes. A company of which Mr. R.S. Merrill is manager, commenced on Saturday, boring the old hole. They have a 25 horse power engine and apparatus to sink 2,200 feet. The indications are said by proficients to be excellent. The oil is of a very superior quality. Mr. W.D.H. Chapin, of Brandford, Pa., a leading oil man is interested in the project and is expected to visit the work this week. Success to the speculation!"

Weekly Freeman - Dec. 6, 1879 Boring for Oil at Memramcook. - The Times states that the oil company, working in the rear of the College, at Memramcook, are now drilling. They have reached the depth of between thirty and forty feet. It is believed that they will strike oil, if not where they are working, at least somewhere in the vicinity."

S.J. Daily Telegraph - Dec. 10, 1879 Striking an Oil Sandstone at Memramcook. - The Times says that the American gentlemen who are now boring in the old oil region at Memramcook, in the hope of striking petroleum in paying quantities, have gone down to a depth of between 500 and 600 feet. Last week, at a depth of 300 feet, oil sandstones, similar to the first sandstones at Oil Creek, Pennsylvania, were reached, but after passing through these for 18 feet, black shale again came to the surface and has continued since."

Moncton Daily Times - Dec. 16, 1879 The oil borers at Memramcook have gone to a depth of about 1,000 feet, and at present are bringing up a blue shale. They propose going to a depth of about 1,800 feet, and if not successful, will probably suspend operations for the season."

Chignecto Post - Dec. 25, 1879 Operations Suspended.- The cold weather which has, for some time, been making itself so severely felt, has put a stop to the oil exploration operations which have, for some time, been carried on in Memramcook. The work, however, is, it appears, only temporarily suspended as it is said that renewed attempts will be made next spring to find oil on the Yankee farm."

Daily Telegraph - Apr. 5, 1883 A flowing oil well has been discovered by Mr. John Dickey on his property, about one and a half miles from Middleton, in the County of Westmorland. The present yield is six gallons per day. Mr. Dickey intends to make some borings and expects to find an immense flow."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Moncton Daily Times - Jul. 14, 1883 Was It An Oil Vein? - Yesterday afternoon, the men working at excavations for a cellar under Mr. T.U. Getchall's property on Main Street, struck a large rock. On breaking it up, it proved to be shale and a strong smell of petroleum came from it. On examination oil was found on the broken stone. The peculiar find created considerable excitement. Some say it must have been a leakage, but as the point where the stone was dug out is about seven feet below the surface, and the oil apparently came from the centre of the stone, the leakage theory cannot hold good. Oil has been found in small quantities at various points in the vicinity of Moncton. Some eight or ten years ago, more or less, there was some excitement over a reported oil find in the town itself, but it did not amount to anything."

Moncton Daily Times - Nov. 12, 1883 St. Joseph Petroleum Company. - A meeting of the shareholders of the St. Joseph Petroleum Company is to be held at the Company's office in Dorchester on the 5th of December next, for the purpose of electing directors, changing the bye-laws, and considering or acting on offers to dispose of rights of the Company."

Moncton Daily Times - Nov. 14, 1883 ADVERTISEMENT:Office of the Saint Joseph Petroleum Co'y of New Brunswick. -- Dorchester, N.B., Nov. 11, 1883. In pursuance of a call signed by Edward E. Allison, Rufus S. Merrill, Joshua Merrill and J. Payson Bradley, stockholders in the Saint Joseph Petroleum Company of New Brunswick, I hereby call a special meeting of the Stockholders of the Company to be held at the office of the Company in Dorchester, N.B., on Wednesday, Dec. 5th, 1883 at 10 o'clock in the forenoon, for the purpose of electing Directors of the Company, amending the Bye-laws of the Company and transacting such other business as may come before the meeting; also to take into consideration or act upon the disposal of the leases and property held by the Company by Sale or otherwise. J.V.L. Rianhard, Secretary-Treasurer Of the Saint Joseph Petroleum Co. of New Brunswick."

S.J. Daily Sun - Jul. 12, 1888 and Daily Telegraph - Jul. 12, 1888 Looking for Oil. - Lewis Emory of Bradford, Penn., and Mr. Carll, a Pennsylvania geologist, who have recently been making explorations for oil in Westmorland county, were in Newcastle last week inquiring into the reported discovery of oil at the rear of the town. The prospectors made some explorations at the Mill Cove and elsewhere but were unable to discover any indications that would warrant the expense of boring. They left on Monday to inspect the well recently discovered in Gaspe, and will return in a few days to continue their search on the branches of the Miramichi. -[Advocate"

Daily Telegraph - Jul. 21, 1888 Struck Oil. - Mr. Terence Toole, the well known pump borer of Gaspe, P.Q., is now engaged boring a well for Messrs Stetson & Jordan, at Pleasant Point. He has already reached a depth of 225 feet and reports the indications for water good. It is said that there are also some slight indications of oil there."
Saint John Evening Gazette - Feb. 1, 1889 It is rumored that oil has been discovered at Noiles Lake, a few miles from Port Elgin, and that the owner of the premises has been offered $5000 for his claim."

S.J. Daily Sun - Feb. 4, 1889 It is rumored that oil has been discovered at Noiles Lake, a few miles from Port Elgin."

Evening Gazette - Oct. 17, 1891 Mining License Granted. - John Duncan, brakeman, of this City, has obtained a license to search over five square miles of land in the parish of Dover, Westmorland County. Part of the land covered in the lease is owned by Mr. Duncan, and experts have informed him that the area is rich in coal and oil. Some oil has been found, and tested very satisfactorily. Mr. Duncan has also been informed by experts that his find is a valuable one."

Chignecto Post - Oct. 29, 1891 John Duncan, brakeman, of St. John has obtained a mining license to search over five square miles of land in the parish of Dover, Westmorland County. Part of the land covered in the lease is owned by Mr. Duncan and experts have informed him that the area is rich in coal and oil."

Chignecto Post - Oct. 29, 1891 John Duncan has applied for the right to search for minerals on an area of 5 square miles described in the Royal Gazette as follows: Begin on the En. bank or shore of Shepody Bay at the S.W. angle of lot No. 69, in letter B division of 44 acre upland lots in the Sackville grant, north of Cape Meranguin; thence running by the magnet east 3/4 mile, south 2 1/4 miles, west 2 1/4 miles, and east 1 1/2 mile to beginning......"

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Moncton Transcript - Nov. 6, 1893 Natural Gas. - Discovered About Two Miles from this City. - A discovery of natural gas was made some time ago, a distance of about two miles from here by the road, but not more than a mile and a half in an air line. The discovery was made in a barren boggy district, some distance back of the Fox Creek road, so called. The ground is almost impassable in the rainy season, and is valueless for agricultural purposes. The fact that natural gas existed there has been known for some time by residents in the locality, but they do not appear to have realized the possibilities within their reach. The water, wherever it lies in the bog, for an area of 100 acres or more, shows unmistakable signs of the existence of gas, resembling an electric battery in process of being charged, and almost any place where a match is held close to the surface of the water a blaze as large as a gas jet will result. When a stick is shoved into the soft ground, if only for a distance of a foot or two, the existence of the gas is shown and at one spot where a boring has been made to a depth of 70 feet the indications are still more marked. The water when boiled down, leaves a considerable sediment of sulphurous matter. It is believed from the large area showing indications that a valuable deposit exists, and the right to make further tests has been secured by Mr. Lodge of this city."

Moncton Daily Times - Nov. 6, 1893 Natural Gas Near Moncton. - A Discovery That May Be Very Valuable. - Made About Two Miles From Town: Some Facts About Natural Gas Industry. - It has been known for some time that natural gas existed in a property about two miles from Moncton, a short distance east of the Fox Creek road. The discovery was made in a swampy piece of land on the farm of Ferdinand Govang, and the area showing surface indications of gas is over 100 acres in extent. The swamp is usually dotted with small pools of water, on which the indications of gas are the most pronounced, but a stick thrust into the soft ground almost anywhere in the locality will produce the same results. These pools of water are constantly bubbling, and resemble an electric battery in process of being charged. A representative of the Times visited the property a few days ago and say that the reports in regard to it have not been overdrawn. A match skimmed over the surface of any of the small pools, or held close to the ground where a stick was thrust in, would result in a succession of flashes of flame about the size of an ordinary gas jet. At one place a rough boring has been made to a depth of about 70 feet and there the indications are rather more pronounced than elsewhere. Mr. M. Lodge has secured the right to further prospect the property and if gas is found in commercial quantities it will without doubt become very valuable. There are indications of oil at various points in Westmorland county, and the existence of numerous pockets of the famous Albertite coal indicate the existence of unusual geological conditions over a wide area, but so far as we know this is the only discovery of surface indications of natural gas yet made in this section. The natural gas industry has for some time been attracting considerable attention in Ontario and some valuable discoveries have been made, resulting in the organization of many companies with adequate capital to prosecute the work. Successful operations have, however, been confined to Essex, Welland, and Haldimand counties, where heavy flows of gas were obtained, wells sunk at Belleville, Toronto, and Kingston, affording very small and short lived flows. In Welland county, there were, according to the geological report of Canada, issued in 1893, no less than 26 wells in operation with the enormous daily flow of 56, 045,000 feet, one well alone having a daily flow of 12 1/2 million feet. Gas is found only at enormous depths, borings having been made in one case for 2,720 feet. The average depth at which gas is struck, however, is from 608 to 1100 feet. The city of Buffalo is now largely supplied with natural gas carried across the river from wells on the Canadian side, and several Canadian towns are also supplied. The discovery so near Moncton, if it proves workable, will be of untold

Weekly Record - Fri. Nov. 17, 1893 The Moncton papers say that natural gas has been discovered near that city. It is not yet known whether it is in paying quantities or not."

S.J. Daily Sun - Sep. 28, 1893 New Brunswick Oil Property. - G.R. Sangster, of Moncton, who is in town yesterday, gives a good report of the oil property owned in Ohio by the company of which James Manchester, Hon. A.G. Blair. J.W. Lowe, Seaman Lowe and others are members. One well produces 15 barrels a day, which is taken by the Standard Oil company at a fair price. J.W. Lowe, formerly of Amherst, is manager for the company on the grounds."

Moncton Transcript - Sep. 28, 1893 New Brunswick Oil Property. - G.R. Sangster, of Moncton, who was in town yesterday, gives a good report of the oil property owned in Ohio by the company of which James Manchester, Hon. A.G. Blair, J.W. Lowe, Seaman Lowe and others are members..."

Chignecto Post - Mar. 15, 1894 New Company.- Messrs. John W.Y. Smith, John M. Beaton, Matthew Lodge, Wm. B. Chandler and Clifford W. Robinson are applying for incorporation as the Moncton Gas, Oil, Mining and Development Company. The capital stock is $25,000, in five thousand shares of $5 each."

Daily Sun - Apr. 21, 1899 New Brunswick Oil. - Premier Emmerson on Wednesday exhibited to members of the legislature at Fredericton, two samples of lubricating oil. Both were refined by the Standard Oil company at their Pennsylvania works. One was from Pennsylvania oil and the other from oil found on the Southwest Miramichi. The reports were that the New Brunswick oil is much superior to that from the great oil state. Naturally the exhibit excited great interest, and the premier was highly pleased at the results of the test."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Gazette - Aug. 14, 1899 To Bore For Oil. - For some months past several parties of geologists have been exploring different sections of the province of New Brunswick for oil. Last autumn Mr. Matthew Lodge representing a number of capitalists made certain proposals to the New Brunswick government to explore the province for oil. Mr. Lodge's propositions were accepted and he immediately made arrangement for the formation of a local company. At the last session of the Provincial Parliament an act was passed entitled An Act to Encourage the Discovery and Development of Oil and Natural Gas within the Province of New Brunswick. The Gazette alluded to this act as most important in connection with the development of the province as it was highly probable that operations would be commenced immediately and the large sum of $200,000 expended in an effort to find oil or natural gas or both. No time was lost by the promoters of the enterprise in getting to work. Experts were appointed to visit every section of the province where it was thought oil was likely to be discovered on the surface and to test its quality a small quantity was refined. It was found to be of excellent quality, and easily refined. The results of the exploration, generally speaking, have been highly satisfactory. The field parties have discovered unquestionable evidence of oil in several localities and the results have been submitted to Prof. Shaler of Harvard College, who has had charge of all the parties at work in the province. Prof. Shaler visited the different localities where the strata gave evidences of oil and was greatly pleased with all that he saw and convinced that there is not only oil under the surface but large quantities of it. This fact he reported to the Boston capitalists who are interested with the New Brunswick company. A few days ago accompanied by Premier Emmerson, Mr. Lodge went to Boston and had a conference with the men who have agreed to furnish the money if the report of Prof. Shaler was satisfactory. That the report was all that could be desired is proven by the fact that the Boston parties have agreed to expend $200,000 boring for oil under the provisions of the act above mentioned. The borings will be made in four different parts of the province extending from the county of Gloucester to Albert county. This will be good news to the people of the province. Not only will the discovery of oil in New Brunswick add to the revenue of the province as five per cent of the product goes into the provincial treasury but it will add greatly to the prosperity of the whole country. The boring will be commenced immediately and before the snow flies the people of the Province ought to know whether oil exists in paying quantities in New

Gazette - Aug. 14, 1899 Hon. H.R. Emmerson and W. Lodge, who returned last week from Boston, completed arrangements with Boston capitalists for commencing boring for oil in various sections of New Brunswick. It is expected that the operations will be begun within three weeks and test holes will be sunk in Westmorland and Albert and North Shore

Gazette - Aug. 18, 1899 To Bore For Oil. - Incorporation Sought For New Company and Purposes. - The New Brunswick Petroleum Company (Limited) is seeking incorporation. The objects for which it is asked are: To bore for oil and gas, and to refine and manufacture and buy and sell the same, and generally to carry on a business of oil and gas; to purchase and acquire, hold, use and occupy any lands, buildings, mines, minerals, mining and other rights, interests, options, concessions, grants, easements, authorities and privileges, and any interest therein; to acquire any exclusive rights in letters patent, franchise, or patent rights or privileges, or in lands in connection with the business of the company; to acquire the good will of any business within the objects of the Company, and any lands, privileges, rights and contracts appertaining to the same, and in connection with any such purchase to undertake the liabilities of any company, association, partnership or person; to sell or otherwise dispose of the whole or any branch or part of the business or property of the Company to any Company carrying on, or formed for the purpose of carrying on, any objects similar to those of this Company; to acquire by original subscriptions or otherwise, and to hold, sell, mortgage, or otherwise dispose of shares, stocks, whether common or preferred, debentures, debenture stocks, bonds and other obligations, of any company carrying on, or formed for the purpose of carrying on, any trade or business within the objects of this Company; to apply from time to time any part of the funds, stock, whether common or preferred, bonds, debentures and other obligations of the Company for any purpose of the Company to construct, manufacture, maintain, open, work, control and superintend any plant, building, dwellings, stores, depots, supply houses, warehouses, factories, mills, works, gas works, electric, steam, water of hydraulic works, also ores, minerals, metals, mines, with mills, machinery and works thereof, also reservoirs, shafts, wells, aquaducts, water courses, tanks, pipe lines, drains and conduits, and wharves, docks and ships and vessels of all kinds, also tramways, roads, ways, bridges, telegraphs and telephones, and all other machinery, works, or power, which may seem directly or indirectly conducive to, or expedient and useful for any of the purposes of the Company, and to contribute to, and subsidize, and otherwise aid or take part in any such operations; to purchase, acquire and deal in, personal property of all kinds, machinery, patents and trade marks, timber and timber rights, ores, metals, minerals, and mining rights and easements of every description, and all rights of way and of common carriage in connection with the business of the company; and to improve, manage, develop, lease, mortgage, sell, dispose of, and otherwise deal with all or any of the property, or the rights, franchise or privileges of the Company, with power subject to the provisions of the aforesaid Act, to accept as a consideration therefor, any shares, stock, debentures or securities of any other Company; and, generally, with power and authority to do any matter or thing necessary to carry out any of the above objects, or incidental or conducive to the carrying out of the same, subject however to the laws of the Province of New Brunswick. The Office or principal place of business of the said company is to be at the City of Moncton, in the county of Westmorland. The amount of the Capital stock of the Company is to be one million dollars, divided into one hundred thousand shares of Ten dollars each, of which all the shares have been actually subscribed. The applicants are: Allan Ritchie of Newcastle; Ernest Hutchinson of Douglastown; R.A. Lawlor of Chatham; Jas. T. Ryan, E.C. Cole, A. Cavour Chapman, J.T. Hawke, F.W. Sumner, Harvey Atkinson, Matthew Lodge of Moncton; Jeremiah B. McManus, Jas. P. Sherry of Memramcook; A.P. Barnhill, W.C.R. Allan of St. John; Henry Duncan of Campbellton; Willard Kitchen of Fredericton; Henry C. Read, Wm. F. George of Sackville; W. Frank Taylor of Hillsborough; E.P. Eastman of Petitcodiac; Pascal Poirier of Shediac; G.G. King of Chipman, S.H. White of Sussex and A.D. Richard of Dorchester Of these Hon. G.G. King, Hon. A.D. Richard, H.C. Read, Matthew Lodge, Ernest Hutchinson, Willard Kitchen and W. Frank Taylor are to

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;

N.B. Reporter - Aug. 23, 1899 New Oil Company. - Allan Ritchie, Newcastle; Ernest Hutchinson, Douglastown; Richard A. Lawlor, Chatham; James T. Ryan, Moncton; Edward C. Cole, Moncton; Jeremiah B. McManus, Memramcook; James P. Sherry, Memramcook; Alexander P. Barnhill, St. John; Henry Lunam, Campbellton; Willard Kitchen, Fredericton; Henry C. Read, Sackville; A. Cavour Chapman, Moncton; W. Frank Taylor, Moncton; Fred W. Summer, Moncton; Edward P. Eastman, Petitcodiac; Wm. F. George, Sackville; Pascal Poirer, Shediac; Harvey Atkinson, Moncton; George G. King, Chipman; Simeon H. Waite, Sussex; Matthew Lodge, Moncton; and Ambrose D. Richard, Dorchester, of whom George G. King, Hon. Ambrose D. Richard, Henry C. Read, Matthew Lodge, Ernest Hutchinson, Willard Kitchen and W. Frank Taylor are the first or provisional directors, are seeking incorporation as the New Brunswick Petroleum Company, Ltd., with powers to bore for oil and gas, and to carry on a general oil refining business. Moncton is to be the chief place of business, and the capital stock is placed at $1,000,000, divided into 100,000 shares of $10 each."

Semi-Weekly Telegraph - May 13, 1899 and Richibucto Review - May 18, 1899 New Brunswick Oil and Gas Company Seeking Incorporation. - The Headquarters to Be at Moncton and the Capital Stock to Be a Million Dollars. - Fredericton, May 11. - Notice is given in this week's Royal Gazette, that application will be made to the lieutenant governor in council, for a grant of letters patent to incorporate the New Brunswick Oil and Gas Company, Limited. The chief object for which the incorporation is sought is to bore for oil and gas, and to refine and manufacture and buy and sell the same, and generally carry on the business of oil and gas. The office and principal place of business of the company shall be in Moncton, and the amount of capital stock shall be one million shares of one dollar each, of which all the shares have been actually subscribed. The list of applicants is made up as follows:- Allan Ritchie, of Newcastle, lumber merchant; Ernest Hutchinson, of Douglastown, lumber merchant; Richard A. Lawlor, of Chatham, barrister-at-law; James T. Ryan, of Moncton, merchant; Edward C. Cole, of Moncton, merchant; Jeremiah B. McManus, of Memramcook, merchant; James P. Sherry, of Memramcook, merchant; Alexander P. Barnhill, of St. John, barrister-at-law; W.C. Rudman Allan, of the city of St. John, druggist; Henry Lunam, of Campbellton, physician; William Kitchen, of Fredericton, merchant; Henry C. Read, of Sackville, manufacturer; A. Cavour Chapman, Moncton, manufacturer; W. Frank Taylor, of Hillsborough, accountant; John T. Hawke, of Moncton, publisher; Fred W. Summer, of Moncton, merchant; Edward Eastman, of Petitcodiac, lumberman; William F. George, of Sackville, farmer; Pascal Poirier, of Shediac, barrister- at-law; Harvey Atkinson, of Moncton, barrister-at-law; Geo. G. King, of Chipman, merchant; Simeon H. White, of Sussex, merchant; Gilbert R. Elliot, of Moncton, engineer; Matthew Lodge, of Moncton, accountant; and Ambrose D. Richard, of Dorchester, barrister-at-law. Of whom the said honorable George G. King, of Chipman, Hon. Ambrose D. Richard, of Dorchester, Henry C. Read, of Sackville, Matthew Lodge, of Moncton, Ernest Hutchinson, of Douglastown, Willard Kitchen, of Fredericton and W. Frank Taylor, of Hillsboro, are to be the first or provisional directors of the company."

Weekly Record - Fri., May 19, 1899 Among the promoters of the $1,000,000 company organized for the purpose of searching for oil and gas in New Brunswick, are Messrs S.H. White and C.T. White, of this town."

Moncton Daily Times - Nov. 21, 1899 New Contract Let. - The work of boring for oil at Dover has been suspended for a few days, and it is announced that the machinery which has been utilized proved inefficient and has been returned to Boston. The work, it seems, was not being proceeded with as rapidly as was desired, and a contract has been let to J.R. Feeley, of Philadelphia, who is erecting new machinery with a view to prosecuting the boring more vigorously. Up to the present time a depth of 310 feet has been reached."

Daily Times - Oct. 31, 1899 Oil Boring Operations. - An Adjourned meeting of the New Brunswick Petroleum Co. was held at Dorchester yesterday to complete organization. Prof. Shaler, who paid a short visit to Moncton in the interests of the American capitalists, to ascertain how the oil boring operations were progressing, returned home yesterday. He expressed himself well pleased with the outlook and finds the strata and soil much the same as he anticipated. The indications are so favorable that he proposes proceeding with the boring in other localities as soon as the machinery can be got ready."

Moncton Daily Times - Sep. 18, 1899 To Bore at Dover. - The first operations in connection with the boring enterprise are to be commenced at Dover on the farm of Mr. Ralph Steeves, at the head of the Dover Road, about six miles below Moncton. Boring machinery was taken down on Saturday, and Mr. E.A. Clark, who has the contract in connection with the operations to be carried on in this section, will have the machinery set up at once and expects to commence boring in a

Semi-Weekly Telegraph - Sep. 20, 1899 To Bore For Oil. - The Machinery Has Been Sent To Dover and Will Be Set Up and Started At Once. - Moncton, Sept. 17. - Saturday the boring machinery was taken to Dover, about six miles below Moncton, where the first hole in connection with the oil boring enterprize is to be sunk. The machinery will be set up at once, and E.A. Clark of Boston, the contractor for the boring operations, expects to be at work in a day or two."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Daily Sun - Apr. 12, 1900 Coal and Oil. - Meeting of the Baltimore Railway and Coal Company Yesterday. - Prospects for Albert County Shale - the Gaspe Oil Fields - Interview With Henry Higgins of London. - A meeting of the Baltimore Railway and Coal Co. was held in this city yesterday. H.H. McLean is solicitor for the company, and among those present were Col. John C. Calhoun, Captain James Calhoun and Charles S. Daley, of the legal firm of Logan, Harby & Dunsend, all of New York, and Henry Higgins of London, England, who is a director of the company, and who is also chairman of the Petroleum Oil Trust, Ltd., of London. The company discussed matters connected with their proposed operations in Albert county, and it is understood will shortly begin operations on the branch lines of railway for which charters are now being asked in the dominion parliament. Last evening Lt. Col. McLean entertained Col. Calhoun and Mr. Higgins at luncheon in the Union Club, and gathered together a number of leading citizens to meet them around the festive board. Capt. Calhoun, Mr. Daley and one of the company's engineers went to Moncton last evening. Mr. Higgins, as just stated, is chairman of the London company which owns the Gaspe oil properties. Interviewed by the Sun, at the Royal last evening, he said that his company had expended a large amount of money in sinking oil wells in Gaspe, where they own 50 square miles of territory and hold mining rights on 40,000 acres more. They have sunk 40 wells, and have constructed 75 miles of roadway. Experts declare that there is a great lake of oil under Gaspe, and as a matter of fact the company have found oil in every well bored, and in one notable case the oil spouted and threw out the boring plant, and the stream of oil rose seventy feet in the air. They have docks, vessels and stores at Gaspe Basin, with excellent quarters for their men, of whom some 200 are constantly employed. The company have expended a large amount of money and are confident that the lake of oil will be tapped in due time and prove a perfect bonanza for that part of Canada. The engineers tell them that there is room to sink 12,000 wells on their property. Mr. Higgins is convinced that the experts are right and that a great oil industry will be developed. Speaking of the Baltimore shale in Albert county, Mr. Higgins says he went over the property last autumn, and took samples of the shale back to London, where experts informed him that it contained a large percentage of oil. Engineers have now gone up to sink tunnels and take out more of the shale, which will be taken to London and Paris, and practically tested in the leading gas works in Europe. While speaking of the Baltimore property, Mr. Higgins said he believed there may be a great amalgamation of coal and oil properties in Canada, involving a capital of $50,000,000. There is in England, he says, a great patriotic feeling now, which favors the production of oil by British capital on British soil, and to be carried in British ships. And in this connection Mr. Higgins grew enthusiastic. He was in Quebec when the first contingent sailed for South Africa, and he has been in England since. Canada's action in respect to the war, and the splendid bravery of her sons in the field, have given this country a wonderfully increased prestige in the mother land, and patriotism runs high. Speaking again of the proposed amalgamation of oil and coal interests, Mr. Higgins said that if

consummated it would be entirely independent of the Standard Oil Co., and having no connection with it whatever. Experts agree that the Pennsylvania oil wells will before many years be practically exhausted. Canada, Mr. Higgins thinks, will be a great oil country in the future. His company in Gaspe have secured power from the Quebec legislature to lay pipe lines and build tramways. The Standard Oil Co. made them a handsome offer for their property, but they declined to sell. They propose to go on with the work of development. Sir William Bailey, an ex-mayor of Manchester, and a member of the company, is coming out to Gaspe, probably next month. The company is one of large capital. Mr. Higgins leaves this

Moncton Daily Times - Jun. 12, 1900 Struck Oil. - At a depth of about 365 feet the prospectors for oil at Memramcook struck the desired article under the heading of what they call a pumping well. It was decided not to torpedo the first sands but to continue boring to the second sands in the hope of finding the oil in a greater quantity. The boring at Memramcook has been on the college grounds."

S.J. Daily Sun - Jun. 18, 1900 Oil Development. - A conference was held at Moncton Saturday, which was attended by Premier Emmerson, B.F. Pearson of Halifax, Mr. Lodge of Moncton and Mr. Benton of Toronto, with respect to the oil development business in Westmorland county. It is understood that those interested in the oil industry up there have every confidence in its success, and that, too, at an early day. It is stated that in addition to the other wealthy United States capitalists who have put in their money for the development of the industry, H.M. Whitney of Boston, who is well known in connection with so many enterprises, has secured an interest in the Westmorland oil development business."

Moncton Daily Times - May 3, 1900 Oil Boring Operations. - The oil boring operations being carried on at Dover have been suspended at the old site and the machinery moved to a new locality. A depth of about 1350 feet was reached with favorable indications but with little or no trace of the commodity in which the company is in search of."

Moncton Daily Times - May 19, 1900 The Oil Boring. - The oil boring machinery has been removed from Dover to Memramcook and a well will be sunk near St. Joseph's college. The well sunk at Dover proved to be dry at 1200 or 1300 feet, but the promoters have greater confidence in the prospects at Memramcook."

St. Croix Courier - Aug. 1, 1901 The latest reports from the Memramcook oil wells go to show that the capacity of the well from which the oil is flowing has increased to 10 bbls. per day. This is certainly satisfactory and will undoubtedly lead to a still greater development of the explorations in the province. Samples of the oil submitted to the best analytical tests indicate it to be one of the finest grades of petroleum in the United States or Canada."

Moncton Daily Times - Aug. 9, 1901 and S.J. Daily Sun - Aug. 10, 1901 St. Joseph Oil Wells. - Dr. James Hannay, former editor of the St. John Telegraph, who is making a tour of New Brunswick in the interests of the historical and geographical works he is preparing for use in the schools, is in the city, and in company with R. Clark, of the Bank of Montreal, M. McDade, St. John, and M. Lodge, visited the oil wells at St. Joseph's yesterday."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
St. Andrews Beacon - Aug. 29, 1901 Oil at Memramcook. - Promoters of the oil bearing operations at St. Joseph's, Memramcook, are greatly elated over the prospects of shortly striking oil in much greater quantity than in the first well. At a depth of about 100 feet in the second well, oil sands were struck and a great flow of gas followed. This regarded as a very favorable indication, and the borers feel confident of striking an overflow well before going much deeper. The recent boring is being carried on very near the first well and the management of the work naturally feel very enthusiastic over the prospects of soon striking oil in a quantity that will demonstrate beyond doubt its existence in abundance in that region."

Daily Sun - Aug. 31, 1901 St. Joseph's Oil Wells. - Oil Struck in No. 2 Thursday morning. - Oil was struck in well No. 2 at St. Joseph's College Thursday morning at the same depth as the first well. Mr. Lodge, who was notified of the strike, went to St. Joseph's, and was very much pleased with the way the boring is panning out. The second well is more promising than the first. More machinery is on the road, and it is expected to have three or four wells started within a week. The second well is situated about 450 feet from well No. 1, and as oil and gas were struck at about the same depth as in the old well, the promoters of the enterprise are satisfied that the oil sands are continuous."

Daily Sun - Aug. 31, 1901 Interview With Mr. Lodge. - Mr. Lodge of Moncton was at the Royal yesterday. A Sun reporter made some enquiries of Mr. Lodge relative to the oil discoveries at St. Joseph's, Westmorland County. Mr. Lodge assured the Sun man that it had now gone beyond the prospect stage. It was evident that there was oil in New Brunswick, and that it could be produced in paying quantities. Mr. Lodge said he was at St. Joseph's when oil was struck at the second well. They had gone down 180 feet when oil was discovered. This is about the same depth where the oil was found at No. 1 well. This well is now producing eight barrels per day. At no. 2 the blow out of gas and the discovery of the oil happened while he was on the ground. The sand was being penetrated when he left, and pumps were to have been put on at once. The second well presents better indications than the first. Three additional rigs are being put in, and two large ones will be introduced for boring large holes at two other points. A depth of 1,500 feet will be made in these two cases. The work of developing the oil discoveries is being pushed forward as rapidly as possible."

Weekly Record - Fri., Dec. 13, 1901 The Oil Wells at Memramcook are still attracting considerable attention. A meeting for the consideration of the general business affairs of the Company will be held at Moncton on the 30th of December. A well is now being put down in Albert county, near Hillsboro, and favorable results are looked for. When shall we have some tests made at or near Sussex? It is said the geological conditions are favorable in this vicinity."

Daily Times - Jul. 4, 1901 The Oil Outlook. - The St. John Globe says: Active development of the new oil fields in Westmorland county has been determined upon, and with this object the members of the company have been given the first call on an allotment of 10,000 shares of the company's stock, par value $10 per share. In this way it is expected to raise about $10,000, which will be used in developing work. The company can get money from Ontario capitalists, but the desire is to keep the stock in the hands of those now holding it, and not to put it on the market as a speculation, so the members themselves will advance the money, taking $10,000 of the treasury stock. The well is yielding two and three barrels a day by pumping, and it is anticipated that this will be greatly increased when torpedoes have been used. The man who has the contract for the boring is taking a large share of the stock. The chief movers in the enterprise are Hon. G.E. King, Hon. H.R. Emmerson and Mr. B.F. Pearson, of Halifax. Local millmen who have examined the barrel of oil from the Westmorland well, now on exhibition in the A.B. McLean Co.'s store. pronounce it the best ever seen in St. John for milling

Moncton Daily Times - Jul. 5, 1901 To Inspect Oil Well. - Prof. L.W. Bailey, of Fredericton, is at the Brunswick enroute to St. Joseph's to inspect the oil borings being made there."

Moncton Daily Times - Jul. 9, 1901 St. Joseph's Oil Well. - About eight barrels of oil a day are being pumped from the oil well at St. Joseph's. Boring was suspended at a depth of about 400 feet and it is the intention to remove the boring apparatus at once to a point 400 or 500 feet distant from the present site. It is proposed to procure more machinery and bore at a number of different points at the same time. Mr. Lodge, secretary of the company, is superintending the pumping operations at the well and feels sanguine that their expectations are now to be realized."

Richibucto Review - Jul. 11, 1901 The oil well at St. Joseph is said to be yielding oil at the rate of eight barrels a day, from a 2 1/2 inch pump attached on Tuesday. The oil sands have proved to be of gratifying thickness, 28 feet. The well has not yet been torpedoed as the flow was thought to be sufficient to warrant pumping without it. Other wells will, it is said, be sunk in the vicinity. - Moncton Times."

S.J. Star - Jul. 16, 1901 and Daily Times - Jul. 18, 1901The Oil Well. - The company opening the oil well at Memramcook have sent to New York for a regular oil pump, and have acquired an engine and boiler with which to operate the same. The whole 10,000 shares of stock which was offered to shareholders to be devoted to development purposes has been taken up, and it is said twice the amount would have been taken at the nominal figures at which it was offered, but the directors held to their original idea although it is understood that a few outsiders secured some of the stock, through the original
Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;

Daily Times - Jul. 18, 1901 Halifax Herald: H.S. Poole, writing to a friend in this city, says he lately visited Memramcook and the borehole where oil has been got in some quantity. He was present when pumping was going on and witnessed the ..?.. flow of oil and gas. During the time he was present about a barrel of oil was obtained, mixed with some water. Since then the water-bearing shales above the oil sands have been shut off and the extension of the hole below the oil producing sandstone has been filled up. In the oil bed itself a heavy charge of dynamite has been exploded to enlarge the well at that point, and an increased flow of oil is looked for when the pump is replaced. Naturally the people of Moncton and the neighborhood are elated and speculate on the establishment of an oil industry. This has been their hope for many long years, and much money has been spent in well boring in the so-called Albert shales of that district."

S.J. Star - Jul. 26, 1901 It is stated that the oil well at Memramcook is now producing twelve barrels of oil per day and there is a good flow of gas. The oil has been analysed and tested in New York with highly satisfactory results. New machinery will be put in and the work of development steadily carried on."

Moncton Daily Times - Jul. 29, 1901 The Oil Wells. - Premier Tweedie, Attorney General Pugsley, Joseph Allison and other St. John men visited the oil wells at St. Joseph's College on Saturday."

S.J. Daily Sun - Jun. 14, 1901 The New Brunswick Petroleum Company seem to have struck a rich find at Memramcook. One half barrel of oil taken from their property Tuesday was sent to St. John, and oil men here pronounce it a very superior quality of crude oil."

Daily Sun - Jun. 14, 1901 Big Oil Strike. - At St. Joseph's, Dorchester Parish, Westmorland County, Made Yesterday. - Prospectors Are Greatly Elated and Will Sink Other Wells at Once. - A Great Future for That District. - (Special to the Sun). - Moncton, N.B., June 13. - Oil is reported to have been struck yesterday in paying quantities at St. Joseph's, Dorchester parish, where borings have been in progress since last year. The present output from the boring is between two and three barrels per day, and Mr. Feeley, the expert in charge, estimates that when torpedoed the wells will yield about ten barrels per day each, while the yield of three barrels a day would be considered a paying quantity. The oil is dark green in color, resembling what is known as No. 1 cylinder stock oil. It is placed in the same standard as the black sands of Pennsylvania. Prospectors are greatly elated, and it is the intention of the company to sink other wells at once. The directors of the company meet at St. Joseph's tomorrow to consider the future plans. It is confidently predicted, as a result of yesterday's strike, that New Brunswick will become one of the greatest oil producers in the world, as the oil fields are estimated to cover an area of eighteen thousand square miles, the sub- carboniferous series of rocks extending from the Bay of Fundy to Bay Chaleur."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;

S.J. Star - Jun. 14, 1901 Have Struck Oil. - A Good Quality of Crude Petroleum at St. Joseph's. - A Flow of Over Two Barrels Per Day Will Probably Yield Ten Barrels When Torpedoed. - (Thursday's Moncton Transcript). - As the result of the reports the company determined to commence actual borings and started in November, 1899. The first well was sunk on R.A. Steeves farm at Dover about seven miles from Moncton. It was sunk 1400 feet and while oil bearing sands were found, it proved to be at that depth a dry well; but it is the company's intention to continue this boring to the lower oil sands at a later date. These lower sands are supposed to be at a depth of from 2500 to 3000 feet. Dry wells are common, even in the richest oil districts and the average is six dry wells to one producer. Note proof of this in the new oil field at Beaumont, Texas, where over twenty dry wells were bored before one producer was sounded. That very district so seemingly unpromising is now producing nearly as much oil as whole groups of other oil fields in the United States combined. The company moved to another part of the prospective oil field on the same range and drilled a well in a little valley south of St. Joseph's, on the college farm. This well was sunk 1,100 feet, but the first oil sands were struck at 365 feet. This was last fall. By a misunderstanding with the driller the first oil sands were not torpedoed, although at the time they yielded considerable oil, which is still flowing between the casings of this well. The company, recognising that a mistake was made in not torpedoing the first oil sands, decided to test this strata at another point. They selected a site westward one mile and sunk a well and supposed the first sands could be reached by a six inch bore. Unfortunately before reaching the oil sands a quicksand was met, which demanded either abandonment or heavy outlay for casing. It was decided as the bore was only a small one, it would be cheaper to abandon and commence anew. On May 14, 1901, the boring plant was moved eastward to the present location. From May 14th until June 11th the borings were continued. An eight inch hole was sunk, and yesterday by a happy coincidence when Senator King, president of the company, Hon. H.R. Emmerson and Mr. Lodge, secretary, were present for business consultation connected with the explorations, the best results were obtained from this well. Today a Transcript representative hearing of the fortunate strike visited the scene and found that the oil output had doubled since yesterday. The present output from the boring is between two and three barrels per day, without torpedoing the well. A three barrel a day pumping well would be considered a good paying well. Mr. Feeley, who has been in charge of the borings and who all through has had great confidence in the results, says that the sands will yield about ten barrels per day from each well. The site which is now yielding oil, it may be remarked, is not in Prof. Shaler's opinion, the district from which the largest producing wells will be found, and further it has never been expected to find large wells in the first sands. All opinion has advised that the lower strata will be the most generous producers and this fact is borne out in all known fields. The best wells in the United States range from 1,200 to 2,500 feet. To bore such wells means a large outlay of capital, and the company has now demonstrated that the oil exists in paying quantities. It is the company's intention to immediately sink other wells in this district and continue to a greater depth the well abandoned last fall. A sample of the oil taken today out of the well was obtained and can be seen at The Transcript Office. It smells genuine enough to satisfy anybody, and even in its crude state can be used for lubricating purposes. In fact it is now being used on the oil well machinery and a barrel is being sent to Senator King to be used in his mill. It is dark green in color and resembles what is known as No. 1 cylinder stock oil. Tests that have been made of this oil place it in the same standard as the black sands of Pennsylvania, and it runs very high in the paraffine products. For this reason, while ordinary crude oil sells in the United States for from 80 cents to $7.00 per barrel at the well's mouth. This grade of petroleum is being obtained in decreasing quantities every year, and the price is naturally rising as the supply cannot equal the increasing demand, on account of the many bye- products obtained from this grade of petroleum. The New Brunswick field promises to be one of the greatest producers of this grade of oil in the known world. While many fields produce oils, with an asphalt basis, few fields produce oils as in New Brunswick, with a paraffine basis. The directors of the company in New Brunswick will meet tomorrow at the works at St. Joseph's to consider the situation precipitated by the present satisfactory results and determine upon extended operations. A few days will probably enable the telling of even better

Daily Sun - Jun. 17, 1901Oil Discoveries. - First Shipment Made from Memramcook to St. John. - The Product Appears to be of a Most Superior Character and Richer Than the American Article. - (Saturday's Moncton Transcript). - The output from the oil well at St. Joseph's continues fully equal to the account given in Thursday's issue of the Transcript. Today two barrels of the crude oil were shipped to St. John, this being the first shipment. The oil obtained from the well at present yielding is of a dark brownish green color, with a pronounced fluorescence and characteristic of crude petroleum. It is free from empyreumatic odor and the specific gravity at 60 Fahr., as determined from a sample taken from the well yesterday, was 0.860 (water 1.00). The gravity of the American crude oils varies between 0.79 and 0.88, and even higher, while the gravity of the crude oil obtained from the distillation of Scotch shale ranges from 0.862 to 0.895. The company have not as yet had the oil analyzed, but from its appearance and specific gravity it would probably yield at least 30 per cent of burning oil, 15 per cent of lubricating oil, and 10 per cent of solid paraffine. The actual tests may be a good deal better than this, as American oils of the same nature average as high as 50 per cent of burning oil. The company are now having the oil analyzed in New York, and will soon know the actual results. The quantity of the output from the present well will largely depend on the results of the torpedoing. At a meeting of the directors of the company, held yesterday at Memramcook, it was decided to push operations. The present well will first be driven to a depth of 400 feet, when it will be torpedoed to give an opportunity for freer output. It was also decided to sink a number of other wells in the same district. After that has been done, the company proposes to have Professor Shaler of Harvard visit the oil fields and locate another territory in the oil belt for further operations. Altogether, the prospect of oil production on a large scale, with a first class product in this district, is certainly very bright. If this expectation be confirmed, that portion of New Brunswick will receive a development more rapid than the most optimistic has ever dreamed."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Star - Jun. 21, 1901 That Oil Strike. - Prospects are Brighter. - Sent a Barrel to St. John. - Larger Flow. - St. Joseph's, Memramcook, June 20.- The oil boring still continues briskly. On Monday a night shift was put on, and the yielding well is now bored to 285 feet. The flow of oil has materially increased since last week, and the daily incidental yield without any pump is about five barrels. The estimated yield before was three barrels. The quantity also continues unimpaired, with an apparent improvement in quality. The oil is now lighter and finer in quality than that first yielded. It is well known experience in oil boring that when oil sands proper begin to flow that the quality of the oil improves. The first shipment of oil was as stated to Senator King, and now a barrel has been sent to A.P. Barnhill of St. John, to be exhibited to the board of trade there. Enquiries are being received from all parts of the country referring to the discoveries. Harold B. Goodrich, the geological surveyor, under whose survey the present operations are being conducted, has written from Boston expressing pleasure that his predictions and theories respecting the oil are being fulfilled in actual experience."

St. John Star - May 15, 1901 While boring for an artesian well at Sussex yesterday a vein was struck which threw a stream about fourteen feet in the air and gradually settled down until it was about four or five feet from the top of the pipe. A lighted match held over the top of the pipe ignited the gas which was also escaping."

St. John Star - Nov. 2, 1901 Oil has been struck in another well at St. Joseph. Four wells are now yielding and the prospects are brighter than ever. A meeting of the company will be held at Moncton next Tuesday."

Daily Sun - Nov. 2, 1901 Struck Oil. - Another Well at St. Joseph is Now Yielding Abundantly. - (Special to the Sun). - Moncton, Nov. 1, - Oil was struck today at St. Joseph, the yield being equal to any yet struck. Work progressing on well number six is not yet down far enough for oil. Four wells are now yielding and the prospects are brighter than ever. The promoters believe that their most sanguine expectations will be realized. -- When shown the above despatch last night, a gentleman interested in the New Brunswick Petroleum Co., said this bit of news was in keeping with the confident expectations of the management. Seven wells had been sunk since the Americans abandoned the enterprise and in three of these oil had been struck, while the work of oil seeking was being continued in the others. Asked if many St. John people were interested, the gentleman replied that the stock was held by New Brunswickers, that no more would be put on the public market, and that there was no likelihood of the management passing out of the present hands. A meeting of the

Daily Sun - Nov. 6, 1901 New Brunswick Oil. - Adjourned Annual Meeting of the Petroleum Co. at Moncton. - Will Push Along Work on a Liberal Scale - Reports Presented - Election of Directors and Board. - (Special to the Sun) - Moncton, Nov. 5. - The adjourned annual meeting of the New Brunswick Petroleum Company this afternoon was attended by H.R. Emmerson, A.D. Richard, E.C. Cole, J.B. McManus, W.F. Taylor, N.McDade, H.F. Pearson, J.T. Ryan, J.P. Sherry, W.H.T. Sumner, E.P. Eastman, Henry Blackwell (London, England), John McGoldrick, Senator Poirier and M. Lodge. The directors report, which dealt fully with the affairs of the company, said oil had been struck in paying quantities in June last. Out of seven wells they had three good producers. Well number six is not yet finished, and number seven has been bored beyond the oil sands. This the directors considered a high average. These wells were now plugged, but in the near future the directors hoped to have them torpedoed and a central pumping station built. The report continued: We have now demonstrated we have an oil district of great promise, producing very high grade oil, and the best facilities for working of any oil field in America. The grade of oil is not a drug on the market, but will command the highest price of any in America. Therefore we feel justified in advising to proceed rapidly with the development of the property. More capital will be needed, and the directors recommend the sale of 40,000 shares of treasury stock at not less than $2 per share. In conclusion the report says the company is opening up property that will benefit the public at large as well as the individual shareholders, and 'as the eyes of the world are upon us it behooves us to be very particular as to every step taken.' Geologist H.R. Gooderich submitted a report with maps illustrating the extent of New Brunswick oil bearing territory. Three thousand feet, he says, is taken as the practicable limit of depth, and the most probable area covers the Petitcodiac river valley and most of Albert county, while the region of secondary probability extends all down the Kennebecasis valley in Kings county. He mentions of localities where oil sands have been observed outcropping: the Albert mines, Albert county, Upper Kennebecasis, Kings county, and the vicinity of Norton. These are only a few occurrences, he says, although it is known an oil bearing formation underlies all the southeastern part of the province. Maps submitted by Mr, Gooderich show the field of operations of the company up to date, beginning with well number one, at Dover in the northwest, in six wells near St. Joseph's College, in the eastern portion. Two new localities recently made on the Albert county side of the Petitcodiac river, above Hillsboro, are added. This map represents an area of 70 miles square. In a general way there are probably three oil sands in different parts of the province. At St. Joseph the first sands have been located in two wells at 176 feet from the surface. In conclusion the report says: We have now learned a great many facts about underground water and other difficulties in the way of boring. Every well tells something new, and by getting to a point where we can increase the percentage of successful localities. That our success has been greater than in almost all other fields makes the outlook for the future very encouraging. The following directors were appointed: H.R. Emmerson, Dorchester; A.P. Barnhill, St. John, A.D. Richard, Dorchester, Jos. Allison, St. John, Ernest Hutchinson, Douglastown, H. Atkinson and M. Lodge, Moncton. Mr. Emmerson is president and manager, Mr. Richard vice-president, Mr. Hutchinson second vice, and Mr. Lodge, secretary treasurer. It was decided to carry on operations on a more extensive scale than at present and for the company to purchase its own machinery instead of letting contracts for boring. Another boring rig has arrived and will be taken to Albert county tomorrow to be operated on the McLatchy farm, three miles this side of Hillsboro."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Star - Nov. 6, 1901 The Oil Wells. - Outlook Promising and Work Will Be Vigorously Carried On. - At the adjourned meeting of the New Brunswick Petroleum Co., at Moncton, yesterday, the following directors were elected:- H.R. Emmerson, Dorchester; A.P. Barnhill. St. John; A.D. Richard, Dorchester; Jos. Allison, St. John; Ernest Hutchinson, Douglastown; H. Atkinson and M. Lodge, Moncton. Mr. Emmerson is president and manager, Mr. Richard vice president, Mr. Hutchinson second vice, and Mr. Lodge secretary treasurer. It was decided to carry on operations on a more extensive scale than at present and the company to purchase its own machinery instead of letting contracts for boring. Another boring rig has arrived and will be taken to Albert county to be operated on the McLatchy farm, three miles from Hillsboro. Out of seven wells the company have three good producers, and the oil is of a quality to command the highest price. More capital is needed and 40,000 shares of treasury stock will be issued at not less than $2 per share. It is hoped soon to have several wells torpedoed and a central pumping station built. The report of the company's geologist, H.B. Godderich, shows that oil sands cover a wide area in the province."

Richibucto Review - Nov. 7, 1901 Moncton, N.B., Nov. 1. - The New Brunswick Oil & Petroleum Company prosecuting boring operations for oil at St. Joseph's College, struck another flow of oil today, in well No. 7. The oil was found in about the same quantity as in the other wells, and the promoters are greatly encouraged. Oil has been struck in four of the seven wells sunk. All wells are in close proximity to each other and in each oil has been struck at about the same depth. The boring will be continued during the fall and winter."

Richibucto Review - Oct. 17, 1901 New Brunswick Oil Product. - The St. John Gazette says: Hon. H.R. Emmerson writing from Bradford, Pa., to a friend in this city under date of October 6th says: - 'Let me say to you that after a careful inspection of the oil wells here and of the production, I am more than ever convinced as to the value of our New Brunswick proposition. The average production of these wells and in surrounding districts is but one half barrel per day, and they pay well with oil, selling at only $1.30 per barrel. Our New Brunswick oil is much superior to this and equal to the quality of an oil from a country near here which sells at $4.50 to $6.50 per barrel. A well that will produce - pump - one barrel per day is considered a gem here. They have no gushers in these days. A five and ten barrel a day well is looked upon as a fortune getter. In this city, containing about 18,000 to 20,000 inhabitants, the oil well derricks are to be counted by the score; yes, hundreds in people's back yards, and in several instances which I noticed, even in their front lawns. Fancy an oil well where our flag staff is at home in Dorchester and yet I have seen similar conditions here. I am simply amazed at the extent of the business. Everybody here has money. It is a very rich city and all the result of oil. I am preparing to go home determined to put down wells as soon as possible. We are too slow, we must move on, and in a hurry. I have visited the refineries and they are within our means and reach.'"

Daily Sun - Oct. 31, 1901 The Oil Fields. - Hon. H.R. Emmerson Predicts a Great Boom in This Province. - (Moncton Transcript). - Hon. H.R. Emmerson has just returned from a seven weeks' tour through the principal oil districts of the United States and gathering information as to the mode of developing the oil districts here. As a result of his enquiries, Mr. Emmerson is more than ever convinced as to the value of the oil prospects here and that the only requisite is the drilling of additional wells. So strong is that conviction he is determined to give it his undivided attention vigorously and enthusiastically, unobstructed or unbridled by political or other considerations. He says he is fully satisfied that great good can be accomplished by this course, and as a result of the oil development the industrial and business interests of the province entirely revolutionized. There was one fact beyond question and that is the superior quality of the Westmorland county oil. It is incomparably superior to any other oil on the continent. He has the judgement of oil experts to this effect and also as to the conditions which prevail here. Out proximity to navigation and also to rail transportation gives us access to both the English and continental markets on this side of the ocean, Our position on the seaboard especially places the English market in our hands, if we have the supply, as he believes. The oil people in the United States are making desperate efforts to grasp the English market. It is looked upon as a very profitable one. There is no reason why we should not outstrip the Americans entirely in meeting the English market demand for oil. Then there is also the question of home consumption. There must be at least $150,000 worth of lubricating oil used in the maritime provinces, not to mention the immense consumption of bituminous oil. Mr. Emmerson thinks it has been unfortunate that the development of this local industry has not been faster. It has been entirely too slow. His great aim personally will be to aid in remedying this condition. The question of refineries has been looked into by him and he feels satisfied that the company will shortly have one under way. It will be a necessity and the cost is within the company's reach and means. It will, he adds, be shortly an accomplished fact. Pipe lines must be immediately laid. He had found a great desire among American capitalists to join interests and engage in this venture here, and if the want of capital were a bar to future development that difficulty can now be readily avoided. A great deal is heard about the Texas oil fields, but they are looked upon by experienced oil men as virtually valueless and to the knowing ones the Texas oil stocks are viewed as bubbles. California oil prospects are somewhat productive, but possibly it is a case of distance lending enchantment to the view. Oil of the quality found in this country is in great demand, and there is no doubt that in the American market it will find a ready sale at profitable terms. Mr. Emmerson says he knows whereof he speaks in saying that there are competing companies now desirous of getting a large proportion of this output to use in their mixture of lubricants. Mr. Emmerson is well satisfied with the results of the borings at Memramcook, which have been going on in his absence, and adds that the great and one want now is additional drilling plant which he believes will soon be supplied."

Richibucto Review - Sep. 5, 1901 Oil was struck in well No. 2 at St. Joseph's College Thursday morning at the same depth as the first well. Mr. Lodge, who was notified of the strike, went to St. Joseph's and was very much pleased with the way the boring is panning out. The second well is more promising than the first. More machinery is on the road, and it is expected to have three or four wells started within a week. The second well is situated about 450 feet from well No. 1 and as oil and gas were struck at about the same depth as in the old well, the promoters of the enterprise are satisfied that the

Emmerson, Sackville; are seeking incorporation as the Bay of Fundy Oil Company, Limited; proposed capital $500,000,divided into shares of $1 each. The company asks authority to bore for oil and gas in New Brunswick. The head office is to be in Moncton."

Richibucto Review - Feb. 27, 1902 Benjamin F. Pearson, George Pearson, Halifax; F.W. Emmerson, Sackville, are seeking incorporation as the Bay of Fundy Oil Company, Limited, proposed capital $500,000, divided into shares of one dollar each. The company asks authority to bore for oil and gas in New Brunswick. The head office is to be at Moncton."

Weekly Record - Fri., Jan. 24, 1902 The secretary of the New Brunswick Petroleum Co. Ltd. informs the Times of Moncton that a depth of 440 in one and 320 feet in another, has been reached in two oil wells being sunk at Hillsboro. No oil has yet been struck. The boring still continues at St. Josephs."

Weekly Record - Fri., Jul. 11, 1902 The shooting of the second oil well at Memramcook, near St. Joseph's College, took place last week, and was as before highly successful and no doubt now exists as to the oil being in commercial quantity both at this point and in Albert Co. Tanks are being erected for the storing of the oil, and the intention is to shoot the wells in Albert County, at an early date when it is confidently expected larger results will be met with than at Memramcook."
S.J. Star - Jul. 23, 1902 M. Lodge, of Moncton, says he thinks the oilwells in Westmorland and Albert counties will prove a good thing. They are getting ready to put up refining."

Richibucto Review - Jun. 26, 1902 New Brunswick Oil. - Well at Memramcook Will Give Good Yield. - Moncton, June 21. - The first oil well at Memramcook was shot on Friday afternoon. The oil in the well this morning was 150 feet deep, and will yield from 20 to 50 barrels per day."

N.B. Reporter - May 14, 1902 M. Lodge of the New Brunswick Petroleum Company, has succeeded in underwriting stock in Toronto and Ingersoll at a substantial advance over prices previously obtained. The amount raised is sufficient to prosecute the work of boring with vigor."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Star - Nov. 5, 1902 Belt of Oil Wells. - Recent Borings Give Interesting Results. - New Pumping Plant. - Moncton, N.B., Nov. 4. - The New Brunswick Petroleum Company have recently been boring wells for oil at Pre d'en Haut. This is on the Westmorland side of the Petitcodiac and on a line with the wells in Albert county and St. Joseph's. The wells are distant about four miles from St. Joseph's and three miles from Albert county wells. The drillers at Pre d'en Haut Friday struck the oil sand at well No. 16. The drillers are still boring and the sands in the yield promise to equal any well yet bored. This proves that the oil territory now extends from St. Joseph's through Pre d'en Haut to Albert county in one belt, the width of which is undetermined by actual borings. The company have just received and are now erecting at St. Joseph's the new pumping plant ordered from Petrolia, Ont. This plant has capacity for 100 wells. A small pumping plant is also being

N.B. Reporter - Nov. 26, 1902 Oil on the Miramichi. - Mr. Samuel Freeze, of Doaktown, who has had experience as a miner in California and the Klondyke, recently found traces of oil near the mouth of Cain's River, and believes that oil strata underly the Miramichi valley. The evidence of oil was so clear that Mr. Freeze proceeded at once to make preliminary arrangements for a practical test. He is getting the owners of the land, for three miles along the river, to sign an agreement that will permit oil seekers to enter upon and use their land for a rental of $10 an acre, and when all have signed, Mr. Freeze will try to induce capitalists to make the necessary borings. It may cost two or three thousand dollars to make the necessary borings. Mr. Freeze thinks the prospects are much better at the scene of his find than they were in the place where oil has been found in paying quantities in Westmorland. - Chatham World."

St. John Star - Oct. 10, 1902 Another Good Oil Well. - Moncton, N.B., Oct. 9. - The New Brunswick Petroleum Company this morning at St. Joseph's shot a well No. 13. Within a few minutes afterwards sixty-eight feet of oil had flowed in and pressure of gas was working. A pipe was put in and a twenty foot flame tonight illuminated the valley. The well is certainly the best struck yet and promises to be a flowing one."

St. John Star - Oct. 11, 1902 Moncton and Oil. - The Moncton Transcript says that town is probably on the eve of a great development. It anticipates that an oil refinery will be built there and that oil for fuel and for power purposes will be available; and that Memramcook oil may even be used as fuel for I.C.R. locomotives."

St. John Star - Oct. 15, 1902 N.B. Petroleum Co. - Moncton, Oct. 14. - The annual meeting of the New Brunswick Petroleum Co. took place here today, President H.R. Emmerson in the chair. After the report of the directors and officers had been received a report was read from L.J. Hert, mining engineer, submitting estimates for a refinery and giving the result of his observation in Pennsylvania, California and New Brunswick fields. Mr. Hert was of the opinion that the New Brunswick fields were more promising than any, except perhaps some in Pennsylvania, and much superior to California. The directors were given power to call a meeting of stockholders for the purpose of borrowing money on the bonds of the company in lieu of issuing more treasury stock, for the erection of a refinery. It was left with the directors to deal with applications for sub leases of territory, several of which have been received, covering areas in St. John and Kings counties as well as Westmorland. The old directors were re-elected as follows: H.R. Emmerson, E. Hutchinson, A.P. Barnhill, Jos. Allison, A.D. Richard, H. Atkinson and M. Lodge. At a subsequent meeting of the directors Mr. Emmerson was elected president and Manager Richard vice-president, Mr. Lodge secretary-treasurer, L.G.B. Lawson and C.G. Scammel auditors."

Weekly Record - Fri., Oct. 17, 1902 The annual meeting of the New Brunswick Petroleum Co., was held at Moncton the first of the week. The directorate presented a very encouraging report. Six applicants from other companies to bore in other sections of the province were considered, and the matter of subletting left in hands of the directors. Sections where it is desired to operate include Kings and St. John, Shemogue and near St. Joseph's."

St. John Star - Oct. 22, 1902 Want Oil Wells. - H.A. Edwards, Miles Whittier, of Caribou, Me., and M.H. Whittier, of Los Angeles, were in Moncton yesterday on a visit to the St. Joseph oil wells. The two former contemplate forming a company to operate for oil in this section, providing they find territory to suit them. M.H. Whittier belongs to the Associated Oil Company of Los Angeles, and was very favorably impressed with the New Brunswick Company's oil field."

Weekly Record - Fri., Oct. 24, 1902 In submitting his report of the prospects of the N.B. Petroleum Co., at Moncton on the 14th to the shareholders at the annual meeting Engineer Hirst expressed the opinion - 'that the quantity of oil on the local fields is unlimited while the quality is superior to California and it is possibly only surpassed by some Pennsylvania oil."

Weekly Record - Fri., Oct. 24, 1902 New Brunswick Petroleum stock is now selling above par. The par value is $10 per share; several shares have recently changed hands at $12.50."

Kings County Record - Sep. 5, 1902 A New Enterprise in Oil Development. - For some years past the evidences of oil deposits in Hants County ... After mature deliberation and feeling greatly encouraged by the discovery of oil in good quantity by the N.B. Petroleum Company at Memramcook, Westmorland County, these gentlemen decided to put the matter in shape... The Nova Scotia Oil and Gas Company Limited has been duly incorporated ... [directors include] Wm. J. Weldon, Moncton, George W. Fowler, M.P., Sussex, Dr. Geo. A. Hetherington, St. John, N.B. E.A. Charters of this place was made General Business Manager. ..."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Star - Sep. 11, 1902 N.B. Oil Industry. - Plans for a Refinery of 400 Barrels Capacity Now Being Prepared. - (Moncton Times.) - The New Brunswick Petroleum Company, Ltd., whose work in the development of the oil fields of this province has aroused so much interest, is preparing to operate on a large scale in the immediate future. M. Lodge, the energetic secretary, informs the Times that fourteen wells have already been put down, of which nine are producers. Of these wells ten are in Westmorland county, at St. Joseph's, in the vicinity of the well known R.C. College of that name, and four are in Albert county, near Hillsboro, the distance being about seven miles across the country in a north-westerly direction. The majority of these wells have only been sunk to the first oil sands, a distance of 400 to 450 feet, but two were sunk to the second and third sands, about 1,450 feet down. Only two of the wells have been torpedoed so far, but the balance will be shot just as soon as the company is in a position to take care of the product. Two of the wells on the Westmorland county side of the river have been pumped, giving a yield of four to five barrels a day, and pumps will also be applied to the wells on the Albert county side, where the prospects are even better than in Westmorland, to see what they will do without being shot. The pumps are already on the ground waiting for the pipe. The indications are such on the Albert county side of the river Mr. Lodge believes that after being shot the wells there will yield 50 to 100 barrels a day. The company is preparing to erect a refinery, the exact location of which has not been decided upon, and Louis J. Hirt, of Boston, a well known expert in the business, is preparing the plans for the same. The refinery will have a capacity of 400 barrels a day. According to present plans, the company will only go so far as taking off the lighter oils, naptha and benzine, and making burning and lubricating oils. The residuum, the refining of which would be a very expensive operation, beyond the means of the company at the present time, will ne otherwise disposed of until the company sees its way clear to go into this branch of the business."

Weekly Record - Fri., Sep. 12, 1902 New Brunswick Oil Industry. - Plans for the Building of a Large Oil Refinery. - The New Brunswick Petroleum Company, Ltd., whose work in the development of the oil fields of this province has aroused so much interest, is preparing to operate on a large scale in the immediate future. Mr. Lodge, the energetic secretary, informs the Times that fourteen wells have already been put down, of which nine are producers. Of these wells ten are in Westmorland county, at St. Joseph's, in the vicinity of the well known R.C. college of that name, and four are in Albert county, near Hillsboro, the distance between the two locations being about seven miles across the country in a northwesterly direction. The majority of these wells have only been sunk to the first oil sands, a distance of 400 to 450 feet but two were sunk to the second and third sands, about 1500 feet down. Only two of the wells have been torpedoed so far, but the balance will be shot just as soon as the company is in a position to take care of the product. Two of the wells on the Westmorland county side of the river have been pumped, giving a yield of four to five barrels a day, and pumps will also be applied to the wells on the Albert county side, where the prospects are even better than in Westmorland, to see what they will do without being shot. The pumps are already on the ground waiting for pipe. The indications are such on the Albert county side of the river Mr. Lodge believes that after being shot the wells there will yield 50 to 100 barrels a day. The company is preparing to erect a refinery, the exact location of which has not been decided upon, and J. Hirt, of Boston, a well known expert in the business, is preparing the plans for the same. The refinery will have a capacity of 400 barrels a day. According to the present plans, the company will only go so far as taking off the lighter oils, naptha and benzine, and making burning and lubricating oils. The residuum, the refining of which would be a very expensive operation beyond the means of the company at the present time, will be otherwise disposed of until the company sees its way clear to go into this branch of the business. The charter of the New Brunswick Petroleum Company gives it extensive powers and control of all the oil bearing districts of the province, which, it is believed, extends to other counties than Westmorland and Albert, in return for which the company has undertaken to expend not less than $100,000 in development work in the first five years of the life of its charter. In order to facilitate the development of the property over such a large area, it has been proposed to organize subsidiary companies on mutually advantageous terms. - Moncton Times."

S.J. Star - Sep. 24, 1902 The New Brunswick Petroleum Co. will have six complete drilling plants at work at Memramcook and Albert in a few days, and the work of development is proceeding with great vigor."

Weekly Record - Fri., Apr. 24, 1903 A personal visit by a Record correspondent to the oil wells at St. Joseph's last week was very pleasing for on every hand could be seen the strong evidence of oil. Wells are being daily bored, other locations for new ones to be bored being made. A neat and commodious pumping station and pumping rods connect five wells and from these oil is being daily pumped but will soon have to cease as the tanks and all the barrel capacity are now filled or nearly so. The oil is a dark bluish or gray shade resembling thick molasses and the less you get of it on your hands or clothes the better. Mr. Shaw the manager in charge states that out of some 28 or 30 holes in St. Joseph's and in Albert Co., only two may be called dry wells and one of these is showing marked symptoms of coming in. It is the intention to build a refinery near College Bridge this season unless plans are changed and altogether the outlook is highly favorable. The oil as it comes from the wells now is a first class lubricator and surprises all oil experts who examine it."

Weekly Record - Fri., Dec. 4, 1903 Reports from the oil fields in Westmorland County, are very gratifying. During the months of October and November, six wells were struck, four at St. Joseph's and two at Dover. The latest one, struck a short time ago, at St. Joseph's at a depth of 320 feet is reported as a good yielder."

Weekly Record - Fri., Feb. 20, 1903 The Oil Wells at St. Joseph's and Albert Co. are being vigorously developed and one set of the wells at St. Joseph's have been connected with pumping machinery and pumping going on giving good results all through. The owners and chief promoters, are well satisfied with the prospects generally, and next season will see some very prominent development. The company have now 23 wells bored."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Weekly Record - Fri., Jan. 9, 1903 Geo. W. Fowler, M.P., left for Halifax, on Wednesday's midnight train to attend a meeting of the directors of the Nova Scotia Oil and Gas Co. on Thursday."

Richibucto Review - Jul. 16, 1903 They Struck Oil. - Moncton, July 8. - The New Brunswick Petroleum Co. had a great stroke of luck today. On the lower Dover road on Chas. Powell's farm at a place called Colpitt's, they struck oil at 346 feet and in a few minutes twelve feet of oil flowed into a ten inch hole. This is the richest and fastest yield yet."

Weekly Record - Fri., Jul. 17, 1903 M. Lodge, secretary of the N.B. Petroleum Company is jubilant over the big oil strike in well No. 27 at Dover last week. At a depth of 300 ft oil was struck and inside of an hour flowed into a ten inch hole to a depth of twelve feet. The manager of the boring says that nothing like it has been seen yet. Mr. Lodge believes that this will be a flowing well. The indications are that it will at least be a great producer. The well is the first bored at the Dover new district and it is located on a hill on Chas. Powell's farm."

Weekly Record - Fri., Mar. 27, 1903 The New Brunswick Petroleum Co., have struck oil again on Thursday 19th and have added another to the rich yielding wells of Westmorland County. This new well promises to be the richest yielding well yet discovered."

Weekly Record - Fri., May 15, 1903 Attracting Attention. - New Brunswick Oil Areas Interest American Capitalists. - Oil discoveries in this province of late have interested American capitalists. According to the St. John Telegraph Col. Theo. Toensmeier, general manager of the Minnehaha Oil Company, of Southern California, was in that city Wednesday. With him was John J. McCormack, of Boston, real estate man and promoter. Both gentlemen were at the Royal Hotel for a few hours and left by C.P.R. in the evening for Boston. They spent the past two weeks in New Brunswick quietly looking about with an eye to the possibilities of this province as a large oil producing country. What their object is or what is the result of their visit they do not say, beyond that they find there is oil in the province and of good grade. As to the general outlook in New Brunswick they think the country has a good future below it while as for Canada its resources have been but tapped. Col. Toensmeier is a Kentucky man, a mineral engineer of note and an oil expert. He has interests in Chicago and he is general manager of the Minnehaha Oil Company, a mighty youngster which since the first of this year has been growing in Southern California and which, it is intended, a short time shall see, if it is not already, a formidable competitor of the Standard Oil. The colonel talks oil as one who knows all about it and he talks of the Minnehaha with great hope. 'We're reaching out into the Orient,' he said, 'and hope to control a great trade there. We also are pushing eastwards. Our works are extensive and will be greater and in southern California we have a great oil field.' He talked gushers and oil sands and refining but did not state just what the object of his visit here is, but said he and Mr. McCormack would be down this way again soon. Col. Toensmeier and his companion visited up river districts, the North Shore and the oil wells at Memramcook. Of these latter the visitors did not care to give their views. The colonel is a busy man, for his odd minutes at the Royal yesterday were taken up in attending to a voluminous correspondence. Mr. McCormack is not a stranger to St. John and when here met a number of acquaintances. He has been here quite a number of times in the past 30 years and takes an interest in the place. On one of his visits several years ago he wrote an article published in the Telegraph giving a glance into the future of this place and making some suggestions and in several pints the prophecies and hints he then gave have come to be. He accompanied Col. Toensmeier on this trip as one knowing this country. He says their work here has been quietly done and on the next visit there may be more to say."

Weekly Record - Fri., May 22, 1903 Major Geo. W. Trask, of Warren, Pa., a member of the Standard Oil exploration staff arrived at Fredericton on Monday and will drive through to look over the Albert and Westmorland oil fields."

Weekly Record - Fri., May 29, 1903 New Brunswick Oil. - Matthew Lodge, secretary of the New Brunswick Petroleum Company, who is at the Royal, told a Telegraph reporter last evening that another oil well had been successfully shot on the company's oil fields in Albert county. The company are extending their operations into Albert county and will shortly erect works there. The field extends about two miles into Albert county at present. Five boring rigs are now working night and day, and the company are connecting their producing wells with pumps and the oil is being stored in tanks. These tanks at the wells will be connected by a pipe line with central tanks, and plans are now being prepared for the erection of a small refinery, with a capacity of about 150 barrels daily. The company expect in a short time to have twenty boring rigs working, three of which will be engaged in Northumberland, Kent and Kings counties for exploration purposes; the others will be confined to the field that has been producing in order to sink as many wells as possible this summer. The company's best producing well which has been connected with the pumps is turning out twelve barrels a day. The last issue of the stock of the company has been almost all taken up at $10 per share. This was the original par value of the stock which sold when first put on the market for $1 per share, and sold at $3 a year ago. The par value has since been raised to $100, and the prospects appear good for the stock reaching that figure in the near future. Indications of oil have been found at Blackville in Northumberland County, on the Cocaigne river, in Kent county, and at Tracadie and Point Moisella in Gloucester county. Kings county is simply an extension of the present oil fields and the company expects to be successful in their explorations there. - St. John Telegraph."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Weekly Record - Fri., May 29, 1903 A special meeting of the shareholders of the New Brunswick Petroleum Company was held at the office of the company in Moncton Friday last for the purpose of ratifying the resolution of the directors to offer for sale to the shareholders a block of 5,000 shares of the capital stock of the company. The action of the directors was endorsed. The reports of the operators of the company were very satisfactory to the shareholders. The report of the management proved, that there was no truth in the statement recently published that some Americans, lately in the city, had acquired a large portion of the block of shares now being offered, as these shares are available only, pro rata, according to present holdings. It was intimated at the meeting that Professor Shaler, upon whose advice the boring for oil in this province was first undertaken, will soon visit the oil fields again."

Weekly Record - Fri., Nov. 6, 1903 The decision of the New Brunswick Petroleum Co., to build an oil refinery on their property near Memramcook takes their venture out of the realms of speculation and makes it an industrial enterprise worthy of recognition. Work will be begun at once on a plant capable of refining 300 bbls. per day, sufficient oil being now obtained to warrant a plant of this size. The stock in this company which, when first put on market was practically given away, can hardly now be purchased, holders of the same having great faith in its value."

Weekly Record - Fri., Oct. 9, 1903 The striking of oil is becoming a weekly occurrence in this county, says Friday's Moncton Transcript. The New Brunswick Petroleum Company has already struck oil in two additional wells in the St. Joseph district. One of the wells is the very best yet developed. The outlook is most encouraging."

Weekly Record - Fri., Sep. 11, 1903 At a recent meeting of the directors of the New Brunswick Petroleum Co., held in Moncton, the issue of stock to a New Brunswick and Nova Scotia Syndicate, which recently took a large block of same, was authorized and nine thousand shares at $9 per share were sold to the syndicate."

Richibucto Review - Nov. 17, 1904 The New Brunswick Petroleum Co. has suspended boring operations for the winter but the pumps on the present wells will probably be kept going all winter. The Kent Oil Co. has had bad luck with its machinery since striking oil, and little or nothing has been done since. It is expected, however, to shoot a well shortly and keep up the boring operations as long as possible this fall."

Richibucto Review - Nov. 3, 1904 The Beersville Works. - Dr. Hugo Von Hagen, Dr. F. Keith, of Harcourt, and Isaac Purdy, of Purdy's N.Y., were at the Victoria yesterday having just returned from New York. Dr. Von Hagen is president of the Beersville Railway Co., and Dr. Keith occupied a similar position with the Kent Oil Co. These gentlemen informed the Sun that they had struck oil at Beersville, and the indications are that it will be of some consequence. It is about seventy five miles from the Memramcook wells. Dr. Keith has been in New York for some days for the purpose of securing additional capital to make the further development of these various properties possible. The money was forthcoming and boring at several points near where their latest strike has been made, will be at once commenced. Dr. Keith, Dr. Von Hagen and Mr. Purdy left last night for Harcourt. - St. John Star."

Evening Times - Oct. 3, 1904 In Kent Co. - ... Mr. Wilson of the Kent Oil Company are staying at the Eureka."

Evening Times - Oct. 8, 1904 Rich Oil Flow at Beersville. - Strike at 450 feet and Output Good. - Moncton, Oct. 8. - (Special). - Word was received here this morning that oil had been struck at Beersville, where the Kent Oil Co., has been boring for a month. Oil was struck at a depth of 450 feet and there is reported to be a greater flow than at the N.B. Petroleum Co. wells. Gas was much in evidence and the company is elated over the proposed field."

Richibucto Review - Oct. 13, 1904 Oil Struck in Kent Co. - Mr. H.R. Townsend, manager of the Kent Oil Co., received word this morning that oil had been struck at Adamsviile at 450 feet. The gas pressure was so strong as to blow all the water and oil out of the well. The Company had not cased off the water, expecting to have to drill 1000 feet before reaching the oil sands. They will now have to ream and case off the water to save the well. This is a phenomenal condition, to strike oil in a 10 foot well in a new district. It is to be noted this new company is established on lines laid down by the deductions made by the experts of the New Brunswick Petroleum Co., and that experts brought by the Kent Oil Co., concurred in this opinion, without previously knowing the opinions of Prof. Shaler and H.B. Gooderich. It has been conclusively proven that oil exists in this district. The drill has now established the correctness of both theories. No particulars as yet as in quantities of oil have been received. This well is from 60 to 70 miles north of the fields at Memramcook and Dover. -

Richibucto Review - Sep. 8, 1904 The New Brunswick Petroleum Co. has sublet the right to the Kent Oil Co. to bore for oil at Beersville, Kent Co. The company interested in the undertaking includes Dr. M.F. Keith, Harcourt, Mr. W.M. Townsend, Dr. Von Hagen, and other New York parties. A rig has been erected at Beersville and boring is expected to be commenced at once. Dr. Keith is president of the company."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Richibucto Review - Sep. 13, 1904 Kent Oil Co. - A meeting of the Kent Oil Company was held at the Eureka Hotel, Harcourt, on Wednesday for the purpose of organization. The following officers were elected: Dr. M.F. Keith, Harcourt, President. Isaac Purdy, New York, Vice President. W.R. Townsend, Secy.-Treasurer The directors are the officers and Messrs. Geo. Sykes and Dr. Hugo Von Hagen. The company has secured the right from the New Brunswick Petroleum Co. to bore in Albert and Kent. One drill is now operating at Beersville."

Semi-Weekly Sun - Apr. 28, 1906 N.B. Petroleum Co. Sold Oil Cheaply. - Intercolonial Got It Five Cents Less Than Was Formerly Paid to the Imperial Oil Co. - Ottawa, April 25. - Matthew Lodge, secretary of the Eastern Railway Supply Company and of the New Brunswick Petroleum Company, was before the public accounts committee today. His evidence showed that oil which had been furnished the Intercolonial by the Eastern Supply Co. had been furnished on tender at two cents less a gallon than had been paid the Standard Oil Company the two previous years. In the case of the New Brunswick Petroleum Company it was shown that it has been and is now furnishing the Intercolonial with oil at five cents a gallon below what had been previously paid the Imperial Oil Company. The Imperial Company had been paid 9 3/4 cents a wine gallon in bond at Montreal. This meant 15 cents an imperial gallon freight and duty paid at Moncton. The New Brunswick Petroleum Company delivers oil to the Intercolonial at Memramcook at ten cents an Imperial gallon."

North Shore Leader - Nov. 16, 1906 N.B. Petroleum Co. - During the coming winter it is expected that the newly formed English company known as the New Brunswick Petroleum Company will assemble its apparatus so as to commence drilling oil wells in Kent and Northumberland counties early next spring. The new company will have a working capital of œ75,000 and will conduct operations upon an increased scale. An engineer representing the company has already looked over the territory and all the preliminaries are now completed with the exception of incorporating the company. It will be incorporated in England. The old company has been granted permission by the Government to assign its licences to the new company."

North Shore Leader - Aug. 23, 1907 N.B. Oil Co. Will Get Extensive Lease in Province. - The provincial government held a session at Fredericton Friday morning, Premier Robinson presiding. Mr. James Friel, of Dorchester, appeared for the New Brunswick Petroleum Co. which has lately secured considerable English capital. Under the act the company had to spend $20,000 per year for a period of five years in order to get the lease desired. Since the privilege was given them to commence prospecting by the government. Mr. Friel applied to have the company granted a prospecting lease of 10,000 square miles of the Province subject to restrictions which include that the lease will be forfeited in the event of the company not continuing to spend $20,000 per annum. Premier Robinson said after the meeting of the government that he thought the restrictions protected the Province, and that the lease would be issued. The company's work to date had been principally superficial explorations, but that during the past three or four weeks they had practical men at work and that the matter was expected to develop rapidly."

North Shore Leader - Mar. 15, 1907 N.B. Petroleum Co. - Fred W. Summer intends leaving shortly for England in connection with the negotiations for the sale of the New Brunswick Petroleum Co.'s oil field at Memramcook and Dover to an English syndicate. Mr. Summer is president of the old company. M. Lodge, the secretary of the company, has been in England for the past two months in connection with the matter and reports prospects good for a sale. - Moncton Times."

S.J. Star - May 17, 1909 Oil Wells In Operation. - Moncton, May 16. - The English parties who have taken over the working of the oil wells at Memramcook, have commenced vigorous operations. They are running at Legere's Corner, five miles from here; at McGulley's Corner near Memramcook, and are starting at Gouldville. Mr. Boggs, the superintendent, an oil expert from Pennsylvania, says the surface indications point to enormous bodies of oil in this part of the province. The company has been pumping at Dover and is shipping oil from Memramcook."

Kings County Record - Sep. 10, 1909 Among the visitors to Sussex this week were O.P. Boggs, who is interested in oils of this province; Dr. Henderson, one of the leading geologists of the British Empire and a man of wide experience, and Dr. Ells, of the Geological Survey, Ottawa. The party is investigating the deposits of the Albert shales, about Albert and Kings Counties, with a view to their development and are very favorably impressed with what they have seen. Mr. Boggs is interested in natural gas and has every confidence that a large supply is obtainable in Albert and Kings Counties. At present he is sinking wells in Albert and has great encouragement. Borings will probably be made here before many

Campbellton Graphic - Sep. 21, 1909 Natural Gas in N.B. - 'The greatest strike of natural gas ever made in Eastern Canada was made on the property of the New Brunswick Petroleum Company in Albert County last week,' says the St. John Sun. 'From one well alone a volume of gas more than sufficient to light and heat the city of Moncton is flowing and preparations are being rapidly made for sinking other wells in the confident expectation of increasing the quantity tenfold. The discovery in itself has even greater importance as a sure indication of large oil deposits in the vicinity. Arrangements for reaching these are going rapidly."

Moncton Daily Times - Apr. 13, 1910 Natural Gas May Be Installed In Moncton This Fall. - Maritime Oilfields Company Asking For Tenders for Forty-five Miles of Piping. - Terms Agreed Upon Between City and Street Railway Company For Leasing Lighting Works: Company Guarantees Cheaper Light For The City And Small Consumers, and Agree to Pay a Minimum Royalty on Earnings of Not Less Than $10,000 a Year. - ... [agreement with city] ..."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;

S.J. Standard - Apr. 13, 1910 Natural Gas For Moncton Likely Now. - Good News for Railway City In Announcement Made To City Council Last Night. - New Well Discovered. - Special to the Standard. - Moncton, April 12. - That tenders are to be invited for 45 miles of pipe that another promising gas well has been located in the field in Albert county and that an expert has been engaged to come and give an estimate of the cost of installing a natural gas plant in Moncton, is the cheering information given by Mr. Braggs, of the Maritime Oil Fields, Limited, at a meeting with a committee of the city council this evening. Dr. Henderson, the English capitalist, who is at the head of the company, said it expected to be in a position to have natural gas in any quantity this fall and in addition to supplying Moncton they hoped to be in a position to extend their service to Hillsboro, Dorchester and other towns. Another Proposition. - Dr. Henderson who is also at the head of the company that has acquired the charter of the Moncton Street Railway Company has made a proposition for the leasing of the city electric light and gas plant with a view of their joint operation and the basis of an agreement has been arrived at which will shortly be completed for submission to the electors. Under this agreement the company is to pay the city three per cent of its gross earnings on electricity and gas natural or manufactured, for the first five years, four per cent for a further period of five years, then five per cent for five years, and thereafter six per cent for the balance of the period of forty years, which is the term of the proposed lease or the guaranteed minimum amount to be so paid the city being $10,000 a year. The price fixed for electricity for lighting is 11 cents per kilowatt with discount of five per cent for payment and natural gas not more than 50 cents for heating and lighting and for manufacturing purposes not more than 40 cents, revision to be made in ten years subject to the provisions of the Public Utilities Act. City arc lights of 1200 candle power are to be supplied at $65 each and incandescent street lamps of fifty candle power at $17 each. The agreement is regarded as very favorable for the city."

Moncton Daily Times - Apr. 19, 1910 Big Strike Of Oil And Gas In New Albert co. Well. - Maritime Oilfields Company greatly Encouraged in Recent Development Work: New Well Has strong Pressure of Gas and Great Flow of Oil of a Very Superior Quality. - A big strike of oil and gas has been made by the Maritime Oilfields Company in their latest well, completed Saturday night last near Hillsboro, Albert county. The new well is number seven and is 2000 feet deep. At a depth of 1.050 feet a good flow of gas was struck and when 1,750 feet was reached the drill went through fifty feet of oil sands. Saturday night the well was completed and from that time until Monday morning it was found that, 100 feet of oil had poured into the eight inch hole. This means that the natural flow, without shooting the well, amounted to about eight barrels in thirty-six hours. Mr. O.P. Boggs, speaking to a Times reporter yesterday, said this was one of the most encouraging strikes the company had yet made. He expects to shoot well number seven the latter part of this week, as soon as a new supply of nitroglycerine arrives, and the well is then expected to produce 40 or 50 barrels of oil. Not only is the well a great oil producer, but there is also a very strong flow of gas, which has been bottled up. The oil in the new well is found to be of a very high grade. 32 gravity is considered first quality of oil, but the test of the product of the new well showed as high as 37, which is extra quality. oil as high as 38 gravity has been taken from some of the other wells and all the tests show the oil to be above high class. Out of four wells completed on the Albert county side by the Maritime Oilfields Company, three of them are producers of oil and gas. Well number seven is located on the top of a hill and the quantity of gas found in it is equal to the other wells. We,, number eight is now being drilled and two others will be started this week."

Granite Town Greetings - Apr. 20, 1910 The Maritime Oil Fields Company have made another big strike of oil in a well just completed near Hillsboro. At 1,000 feet a large flow of gas was struck and at 1,700 feet oil sands were struck. Saturday night last a well was completed at a depth of 2,000 feet. This morning it was found that the natural flow of oil had risen 100 feet in each inch hole, which is probably the best oil results so far obtained. It is expected when the well is shot the latter part of the week the well will yield at once at least forty or fifty barrels of oil. The oil has been tested and found to be extra good quality. Thirty-two is first quality but this oil goes as high as thirty-seven. The company now has their oil and gas producing wells on the Albert side and are greatly encouraged at the latest strike. Work will be pushed rapidly on the new wells which are expected to turn out equally good as the other."

S.J. Standard - Apr. 27, 1910 Another Gas Well Tapped. - Moncton, April 21. - A report from Albert county late this afternoon is to the effect that still another natural gas well has been struck at a depth of 1050 feet, with a capacity of 800,000 feet daily. This is the second well struck during this season's operations and with three reported last fall give the company a supply of between two and three million feet every 24 hours or enough to supply a city a good deal larger than

S.J. Standard - Aug. 24, 1910 Prominent Men Visit Oil Wells. - Gas Struck At 950 Feet Yields 100,000 Feet a Day. - ...Moncton, Aug. 23. - ... Mr. W.H. Thorne, St. John; Senator Wood, Sackville, and about 15 citizens of Moncton drove in autos to the oil wells in Albert county today. Mr. Henderson, the president of the company, went down with the party. In one of the wells now being bored gas was struck at 950 feet, the flow being about 100,000 feet a day."

St. Croix Courier - Dec. 1, 1910 Hon. James Domville and Hon. W.C.H. Grimmer, who have been on a mission to England with relation to the great oil shale industry in Albert county returned this morning, having accomplished the object of their visit. They were accompanied by J.C.D. MacKenzie, C.E., who will make an inspection of the property for the benefit of British investors. Senator Domville and Dr. MacKenzie will go to Albert on Monday. - Globe."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Standard - Jul. 25, 1910 Explosion of Natural Gas. - Frank Casey Lit Match With Dire Results. - Burning Gas Set Fire To Building Containing Nitro-Glycerine And Only Left Hole In The Ground. - Special to the Standard. - Moncton, July 24. - Frank Casey, a young man employed at the gas wells in Albert County, who was injured in the explosion Saturday, and was brought to the Moncton hospital for treatment, is reported not in danger, as the burns were superficial. Casey had been sent to shut off the water supply at the vat that was being filled by gas pressure when the desire for a quiet smoke overtook him. He lit a match but got no further as the gas ignited. He was fortunately able to give the alarm so that other employees got out of danger. The burning gas set fire to the building that covered about ten quarts of nitroglycerine and this exploded making a deep hole in the ground and extinguishing the fire. Not much damage was done. The explosion was

Evening Times & Star - Jun. 3, 1910 M.P.'s Pay Visit To Oil Wells Of Albert. - Moncton, June 2 - The members of the local opposition met this morning for the consideration of some matters of further interest to the party. They had with them Hon. C.H. LaBillois, who arrived by the morning train, as well as C.M. Legere, M.P.P., who returned from his home. After the session the party, upon the invitation of Hon. C.W. Robinson, visited the oil wells in Albert county, making the trip in the automobiles of Messrs. Robinson and Hon. Mr. Sweeney and F.W. Sumner, who has been much interested from the outset in the development of this wonderful natural resource. The manager, Mr. Boggs, gave them a hearty reception and after dinner showed the party what had been done to bring this wonderful wealth of oil and gas from the depths of the earth. All of those present were amazed at the possibilities shown them, and thoroughly convinced that there had been no exaggeration in the reports concerning the production of oil and gas."

S.J. Standard - Jun. 9, 1910 Look For Gas Wells This Side of Moncton. - W.B. Dickson Thinks Eventually They Will Light St. John. - Making Rapid Strides With Work In Albert. - W.B. Dickson, M.P.P. of Albert county, arrived in the city last evening and is a guest at the Royal. Speaking of the recent discoveries of natural gas made in Albert county, he said the company now operating the wells has nine producing wells between Moncton and Hillsboro. It is believed the gas is also to be found in quantities this side of Moncton and he thinks it will eventually prove of vast benefit to St. John. The company will take over the Moncton Gas Company shortly and will operate street cars and electrical lights in the railway city. The agreement is that gas for general purposes shall be supplied to Moncton for 50c. per 1000 and for manufacturing purposes at 40c. It is expected that the gas will be piped into Hillsboro this fall for fuel purposes. As the supply is considered to be very large there is little fear that it will become exhausted. New wells are being bored as rapidly as possible and every one

Evening Times-Star - Jun. 15, 1910 Premier Hazen said yesterday he would not be surprised to see Moncton become a city of 50,000 people in the next decade or so. This was after he had seen the Albert oil wells and called for three cheers for Mr. Fred W. Sumner. Albert county gas is potent fluid."

S.J. Standard - Jun. 15, 1910 Premier Impressed With The Gas Wells. - Members of Local Government Spent Yesterday at the Maritime Oil Fields Company's Property. - Hon. J.D. Hazen, Hon. Robert Maxwell, and J.E. Wilson, M.P.P., who, in company with other members of the government, and a distinguished party of citizens, paid a visit of inspection of the properties of the Maritime Oilfields Company, Ltd., returned to the city last evening. Interviewed by the Standard, Mr. Hazen said the party had spent a very pleasant day, and had been much impressed by the possibilities of development at the oil fields. 'The operations of the company,' he continued, 'have passed the experimental stage. The gas wells have now a capacity of 7,000,000 cubic feet a day, and experts are of the opinion that the supply is practically unlimited. The company uses the natural gas to run its power plant, and the gas is also being utilized by householders for cooking and lighting purposes. 'Oil too, seems to be fairly plentiful. Ne well yields 14 barrels a day, and the other wells yield a lesser amount. As the company develops its properties, Moncton and other towns in the neighborhood, will be able to secure increasingly large supplies of natural gas and oil, and utilize either for power purposes. As the cost of power and light from these sources, will be very much lower than when produced by coal, a great stimulus will be given to manufacturing industries in the vicinity. :If the wells prove as productive the experts believe they will be, it is not unreasonable to expect that Moncton, with its railway connections, may become in a few years one of the most important manufacturing centres in the Maritime Provinces. Certainly, after what I saw today, I would not be surprised if Moncton became a city with a population of 50,000 in the next decade or so.' Hon. Robert Maxwell. - Hon. Robert Maxwell, when interviewed, was enthusiastic over the industrial possibilities being opened up by the development of the oil fields. 'Albert County,' he said, 'has one of the most important natural assets of the province in its oil and gas wells. All the borings so far have tapped either oil or gas, and we were told that some wells produced both. Some of the gas wells are gushers of a high order; one of them showed a pressure on the gauge of 225 pounds. 'Some of the borings go down to a depth of 2,050 feet, others range between 1250 feet and 1750 feet. The gas pockets are usually located below the oil pockets. 'When the company lays a pipe line to Moncton, that city will have a great advantage over other cities in the Maritime Provinces and other parts of Canada in that it will be able to get power and lighting for manufacturing purposes at very low rates. Capitalists looking about for a site for new industries will be attracted by the advantages Albert County is able to offer, and Moncton is likely to become the centre of a great manufacturing district. 'Every manufacturer knows the advantage of oil or gas over coal for power producing purposes. It makes him independent of fluctuations in the coal market, and eliminates the possibility of being compelled to close down through strikes or lockouts, as well as the expense of handling coal and removing the ashes - quite important items in the cost of producing power. 'Is the natural gas from these wells suitable for the operation of gas engines?' Mr. Maxwell was asked. 'As to that I don't know,' he replied, 'but it is used for fuel to operate the steam engines or the company's property which pump out the oil. If the company is as successful as the experts claim it will be, it may not be long before gas and oil pipes are laid to St. John. What that will mean to the manufacturing industries of this

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Standard - Jun. 15, 1910 The Albert Gas Wells. - Mr. Sumner, with his Westmorland and Albert associates, had something worth while to show to the provincial ministers and other visitors yesterday. Some kinds of mineral resources keep themselves concealed and have always to be taken on trust by the outsider. But the produce of the Albert county gas wells is much in evidence. Every one who goes to the spot is deeply impressed with the value and the possibilities of these resources. Moncton city expects to make great industrial progress through this discovery. Hillsboro, which is nearer the spot, puts in the claim through its newspaper that the industries dependent on the oil and gas deposits belong to Albert and to Hillsboro parish. All will agree that while Moncton is to be illuminated with gas from the neighborhood of Hillsboro, that town should not be left to light itself with oil lamps. But the enthusiastic visitors are convinced that the oil fields are equal to much greater service than Moncton and Hillsboro and several other centres of population require at the present time. Many disappointments have been suffered in operations in the oil district of Albert and Westmorland. But always some persistent explorers believed that some form of illuminant was there in large quantities. This faith seems to have at last obtained its reward. There may be much more to come in native oil and oil shales. But in the meantime the gas is present in obviously large quantities."

Kings County Record - Jun. 24, 1910 New Brunswick is experiencing a mining boom and all over the province an eagerness is being evidenced to exploit. Iron, copper, shales, gypsum and other minerals.Unfortunately the blind policy that looked up whether rightly or wrongly 10,000 square miles of old gas area in New Brunswick in the hands of one concern thus creating a monopoly and preventing the expenditure of capital is to be regretted. Meantime we look to see, our copper, iron, baryta, antimony, lead, zinc, assume good practical shape in the near future."

S.J. Standard - Jun. 30, 1910 Moncton, June 29. - Well number nine in Albert county was successfully shot this afternoon and showed a production of five or six barrels of oil per day and also considerable gas pressure. Manager Boggs expressed himself as well pleased with the results."

Evening Times & Star - Jun. 30, 1910 Shoot Another Oil Well. - Moncton, N.B., June 29 - The Maritime Oil Fields Company this afternoon shot well No. 9 at McLatchey's, and the management are delighted with result. The well contained about fifty barrels of oil and the shot was most successful in every particular. In addition to being a good oil producing well of probably six or seven barrels daily, there was also a strong pressure of gas and it is expected the well will produce about 300,000 cubic feet daily."

Moncton Daily Times - Mar. 29, 1910 Oil Company Meeting Adjourned. - A meeting of the N.B. Petroleum Company was called in the Board Trade rooms yesterday afternoon, but was adjourned without transacting any business. Mr. F.W. Sumner, president, owing to his being unwell, was unable to be present."

S. J. Standard - May 13, 1910 Natural Gas in Abundance. - Rev. Dr. Heinie returned yesterday from Albert County, where he has been on a lecturing tour for the Bible Society. In conversation with a Standard reporter Dr. Heinie stated that while in Stonybrook he saw the natural gas well and kerosene wells. A new natural gas well has just been discovered, with a diameter of six inches. The gas is rising from it very rapidly and with great force. When the gas was first struck it lifted a steel drill weighing three tons clear out of the hole, more than twenty feet. He also visited the kerosene wells, which are now being operated at the rate of fifty barrels a day. A strong company with a capital of $100,000 is in control and are planning to take the gas to Moncton."

S. J. Standard - May 16, 1910 Moncton. - A party of 25 citizens visited the oiland gas wells on Saturday, and were more than surprised at what they saw. Nine wells are now producing gas. At one of these the pressure was found to be 265 pounds when the well was opened and fairly shook the ground and buildings. These wells are oil as well as gas producers. Number 9 well was pumped for oil on Saturday in the presence of the visitors, and nearly filled a 250 gallon tank at the rate of 20 gallons an hour. As the supply of storage tanks is limited, these wells are capped and only pumped occasionally."

Daily Telegraph - Oct. 7, 1910 Another Gas Gusher Struck. - Oil Fields Co. Report New Well With 5,000,000 Feet Capacity a Day. - ... Probably the biggest gas well of the lot was capped by the Maritime Oilfields Co. at McLatchey's tonight. This well, No. 16, is nearer Moncton than the other wells. Gas was struck Tuesday at a depth of 1,440 feet and at a low estimate is capable of supplying 5,000,000 feet per day."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Daily Telegraph - Oct. 14, 1910 Will Exempt Oil Fields Company. - Special Meeting of Albert Municipal Council Grants Petition. - Gas For Moncton. - manager Boggs Says Pipe Lines Will Be Laid To There, Hillsboro and Other Towns if Encouragement is Given. - (Special to the Telegraph) - Hopewell Cape, N.B., Oct. 13 - The Albert Municipal Council, at a special session held here today, authorized the Moncton Street Railway Company to exercise the powers given by the government to lay pipes, etc., in Albert county, with the provision that the company before engaging in any operations should consult with the highway boards. In response to the applications of the companies, exemption from taxation on all plant, buildings, etc., for a period of twelve years was granted to the Moncton street railway, the N.B. Petroleum Company, and the Maritime Oilfields, Ltd. The members of the council at the special meeting were present, as follows: Warden Carnwath presided. Hopewell Couns. Carnwath and Pye; Hillsboro Couns. Jordan Steeves and F.M. Thompson; Harvey, W.H. Martin and Theodore Stevens; Alma, J.A. Cleveland; Elgin, F.W. Godard, Linton Hopper; Coverdale, S.S. Ryan and Lane Colpitts. The only absentee was Councillor Rommel, of Alma, whose residence has been quarantined on account of the smallpox scare. ... Mr. Chandler, in the interests of the allied companies asking for concessions, addressed the council briefly, and was followed by F.W. Sumner, who gave some of the history of the N.B. Petroleum Company, which had begun operations on the Westmorland side of the river some years ago. He thought the company and the Maritime Oilfields Ltd., which was now undertaking the exploitation of the areas on the county, should have inducements. English capital, he said, had been put up and he strongly urged encouragement being given. The result, he believed, would be one of great profit to the county. The Company's Plans. - Mr. Robinson and Mr. Osman also spoke along the same lines. Mr. Boggs, who also spoke briefly, said that the first thing the company proposed to do, providing sufficient encouragement was given, was to lay pipes from the wells to Moncton and to Hillsboro for the transmission of the natural gas, and also to erect a refinery which was likely to be established at Hillsboro. They would also pipe the gas to the different villages throughout the county as it was demanded."

Daily Telegraph - Oct. 21, 1910 Another Gas Strike in Albert Fields. - Well Bored at McLatchey's Shows Output of 2,000,000 Feet Daily. - Special to The Telegraph. - Moncton, N.B., Oct. 20 - Another good gas well has been struck at McLatchey's, Albert county. This morning well No. 14, which has been showing signs of gas for some days, came in at a depth of 1,400 feet, with a flow of about 2,000,000 feet of gas per day. The new well is about 1,000 feet southwest of well No. 15, which came in a few days ago with 5,000,000 cubic feet capacity. O.P. Boggs, F.W. Sumner, M. Lodge and Fred K. Andrews, of St. Stephen, visited the wells this afternoon and confirmed the report of the latest gas strike. It is believed the new ell will show a greater capacity and it will be drilled deeper. Work has been started drilling well No. 16, which has

St. Andrews Beacon - Sep. 1, 1910 Oil Wells of Albert. - Oil and Gas Obtained in Promising Quantities. - There is no doubt about the bonanza that has been opened up to the people of eastern New Brunswick by the discovery of oil and natural gas in Albert county. On Thursday last, a representative of the Beacon drove 12 miles from Moncton to get a glimpse of the oil region. He saw several wells on the hill side overlooking the Petitcodiac river turning out promising quantities of oil; he saw several immense tanks filled to the brim with the black fluid; he saw natural gas with a pressure of 300 lbs. being used to generate steam to drive the big pump; he saw the gas used in generating steam to operate a huge drilling machine; he saw the gas heating to a white heat an eight inch solid steel drill point; he might have seen (had time permitted) the gas being used in the Company's boarding house hard by for general household purposes. Of course everything is in a crude state about the works, but this crudeness will pass off when the Company gets all its schemes in operation. The manager, Nr. Henderson, has recently returned from England, and it is expected that before long something will be doing. Moncton people are greatly interested in the success of this undertaking as they have entered into a contract with the Company to supply them with a street car service and a whole lot of things. The crude oil is being used for lubricating purposes on the I.C.R. at present. It is capable, however, of being manufactured into a large variety of commercial products."

Daily Telegraph - Sep. 1, 1910 Albert Oil Fields. - New Brunswick's oil industry is receiving some advertising at the hands of Consul M.J. Hendrick of Moncton, and the Vice Consul Clarence Carrigan, of St. John. Mr. Carrigan informs Washington that the natural gas found near Moncton is to be piped to St. John, where $1.75 per 1000 cubic feet is now charged for artificial gas. Boston pays only eighty cents per thousand."

Daily Telegraph - Sep. 14, 1910 Natural Gas For Moncton Soon. - Scottish Director of Oilfields Company Promises Supply in the Spring. - A Bright Outlook. - Mr. McGeoch, of Glasgow, Looks Over Ground in Company With Pennsylvania Expert and is Well Satisfied With Conditions - (Special to the Telegraph) - Moncton, N.B., Sept. 13. - Lauchlan A. McGeoch of Glasgow, Scotland, director of the Maritime Oilfield Company, is here for the purpose of inspecting the field of operations in the oil and natural gas district. In company with C.P. Boggs, manager, and others he visited the oil and gas wells in Albert county today and returned delighted with the outlook. He states he already had a good idea of the territory and development work from reports made by Dr. Henderson, but after a personal inspection he found the country and general conditions much more favorable than he anticipated. He had seen photos of natural gas illumination, but he never heard the roar of escaping gas which sounded like many Niagaras. Mr McGeoch says he is very pleased with the development progress being made and he sees a bright outlook for Moncton, and this portion of the province. He found a number of producing gas wells with good pressure, and the oil development was also most encouraging. Early next year, Mr. McGeoch says Moncton will have a gas supply to which it has been looking forward so eagerly. As a director of the company he is thoroughly satisfied with the progress being made. Mr. Law, a gas expert, has been brought here from Pennsylvania in connection with the natural gas installation in Moncton. He also visited the wells today for the first time and will look over the whole proposition before leaving. Dr. Henderson is still absent in Newfoundland."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Standard - Sep. 14, 1910 Scotch Magnate visits Oil Wells. - Moncton, Sept. 13. - Lauchlan A. McGeoch of Glasgow, Scotland, a director of the Maritime Oil Fields, Limited, is here and accompanied by Mr. Law, a natural gas expert from Pennsylvania and others visited the oil and gas fields in Albert Co. today. Mr. McGeoch came here expressly to look into this business and expresses himself as very favorably impressed with what he has seen. He was indeed surprised by the extent of the development already made and particularly by the flow of natural gas. Mr McGeoch thought the development of this industry would have a great effect for good in this section. He thought natural gas would be brought into Moncton early next year. Mr. McGeoch has extensive commercial and manufacturing interests in Glasgow and Birmingham. Dr. Henderson, president of the Maritime Oil Fields, is now in Newfoundland."

Daily Telegraph - Sep. 26, 1910 Maritime Oilfields Co. Wants Exemption From Taxation. - Special Meeting of Albert County Council Oct. 13 to Consider Request and Similar One from Allied Companies. - Hopewell Hill, Sept. 24. - Warden Carnwath has called a special session of the Albert county council for Thursday, October 13. The object of the meeting is to take into consideration ... the application of the N.B. Petroleum Co., the Maritime Oilfields, Ltd. ... for exemption from taxation for twenty years, on plant, machinery, buildings, etc., which may be used in connection with the developing or operating of mines or minerals in the county."

S.J. Standard - Sep. 27, 1910 Pipe Line Here For Natural Gas. - Officers of Company Controlling Albert Co. Gas Looking Forward to Bringing Product to St. John. - J.A.S. Henderson and O.P. Boggs of the Maritime Oil Fields Company, Ltd., were in the city yesterday. They were accompanied by L.A. McGeoch, of Glasgow, Scotland, one of the directors of the company who has been inspecting the property near Moncton. Speaking to a reporter Mr. Henderson said, the development work was proceeding satisfactorily. Recently one of the borings opened a gas pocket which gave a pressure of 530 pounds to the square inch, or more than double the steam pressure in the average boiler. 'We are making plans,' he added, 'to supply the city of Moncton with gas, and we hope in time to construct a pipe line to St. John and supply that city and the intermediate towns. 'As yet we have not made any effort to market the oil, though we have a thousand barrels or so in storage. At present we are chiefly interested in conducting boring operations with a view to determine as far as possible the extent of our gas and oil resources. So far we have had every encouragement to proceed. 'We are not looking for new capital. We have all the backing needed, and will proceed with the work of developing our property as fast as circumstances warrant. The oil is of an excellent quality.'"

Albert Journal - Wednesday, April 19, 1911 Another Great Gusher Was Struck - Good Friday Saw Still Another Great Gas Deposit Tapped - Will Yield 6,000,000 Feet Daily - Another well yielding 6,000,000 cubic feet of natural gas daily was struck early on Good Friday evening at McLatchy's. The drillers resumed work this week after work being closed down during the severe weather, and on Friday they struck natural gas in well No. 19 at a depth of 1,260 feet. The drillers decided to continue boring and early in the evening struck an increased flow at 1,285 feet. The yield is estimated at about 6,000,000 cubic feet per day, which places the well in the first rank for this county and of course above all other known yields of single wells in the settled portions of the Dominion. Although the pressure is tremendous and the difficulties intensified thereby, the drillers were instructed by Manager Boggs to endeavour to continue the drilling. This well is located 2,000 feet west of well No. 16 and is the furthest westerly of the series and the nearest to Moncton. The discovery of this well added to the already enormous possible daily output continues to show that the district here has no rival as a natural gas field in the known natural gas field area in any part of the Dominion. What is wanted now is that the gas shall be brought to some market and that market is waiting at its doors nine miles away. Manager Boggs is naturally elated at the new discovery, within a few days after the resumption of drilling operations this season."

St. Croix Courier - Apr. 27, 1911 A well of natural gas yielding six million cubic feet daily was recently tapped in Albert county, being one of several opened in Albert and Westmorland."

Weekly Record - Jul. 9, 1911 The discovery of gas on the Domville areas at old Albert mines has caused active new ideas to arise in connection with the name. The question to the manufacture of cement is being fully considered, and a syndicate has been formed for the purpose of going into several matters therewith at an early day. We trust the matter will result in something definite being done in the near future."

Albert Journal - Wednesday, May 10, 1911 More Gas Was Struck - Gas has again been struck in large quantities at McLatchey's. At a depth of 1570 feet, in Well No. 20, it was struck and from present indications the well is expected to prove an excellent producer. This is a new well, but 150 feet of it being bored last fall. Operations were commenced on it again about the first of April with the present results. It is on the Hillsboro side of the company's holdings. It is not known definitely yet, what the capacity of the well will be."

St. Andrews Beacon - Aug. 22, 1912 Natural Gas. - Beacon: - 'Two hundred families in Moncton, N.B., are using natural gas for household purposes.'"

S.J. Globe - Aug. 30, 1912 Oil has been discovered on the farm of Mr. Joseph Hornbrook, three miles from Apohaqui Station, and 41 miles from this city. Mr. Hornbrook had leased his property to a Montreal syndicate which was boring for coal. The experts in charge of the boring are sure natural gas will be struck at a greater depth. The oil sand was only 60 feet from the surface."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
S.J. Globe - Feb. 20, 1912 Oil Magnate on Visit to Moncton. - He May Arrange to Run a Pipe Line to St. John. - Moncton, N.B., Feb. 20. - T.M. Barnstall, Pittsburg, one of the most prominent oil and gas men in America is looking over the field, with a view to taking over the distribution of gas. Negotiations are being carried on between the American magnate and the Maritime Oilfields, Limited. It is said that in the event of Mr. Barnstall securing control of the New Brunswick oil and gas field he will pipe gas to St. John, Amherst and other places."

S.J. Globe - Jul. 12, 1912 Gas in Kings Co? - Record. - The rumor that the gas interests of Albert county are coming to Sussex to locate wells here is again revived. It is understood that the management of the company will try and get gas at Sussex for local consumption and for piping to St. John and intermediate points. It is not a remote possibility that work will be undertaken this summer."

Kings County Record - Jul. 12, 1912 The rumor that the gas interests of Albert County are coming to Sussex to locate wells here is again revived. It is understood that the management of the company will try and get gas at Sussex for local consumption and for piping to St. John and intermediate points. It is not a remote possibility that work will be undertaken this summer. If gas is secured here, it should make Sussex one of the most desirable manufacturing centres in the

Kings County Record - Jul. 26, 1912 Gas for Sussex. Will Locate Wells Between Apohaqui and Sussex. Work Starts Soon. - Several weeks ago the Record announced that it had been definitely decided by the Maritime Oilfields Limited to start work on the sinking of gas wells in the vicinity of Sussex. Matthew Lodge, of Moncton, who has been largely interested in the oil and gas development of New Brunswick now announces that boring operations will be started in the near future between Sussex and Apohaqui. From the wells located here, Sussex will receive its supply of fuel and pipes will be laid between here and St. John to supply the city and intermediate points. The coming of natural gas is bound to have a decided effect on the growth of Sussex. The news is good. It means power and cheap fuel for the town and the removal of a lot of nuisances which attend the consumption of coal and wood."

S.J. Globe - Jun. 17, 1912 Natural Gas For City Of St. John. - New Areas Will Soon Be Opened Up By Company. - A visitor to St. John on Saturday was Dr. Henderson, the English capitalist, who is head of the company now engaged in developing the Albert County gas and oil wells. Dr. Henderson's visit to St. John was preliminary to steps that are to be taken to bring natural gas to St. John. Talking with the Globe, Dr. Henderson said the area now under development will be kept for Moncton, and the towns in that vicinity. A new district, somewhat nearer St. John, would be opened up and Dr. Henderson is convinced it will prove as satisfactory. From the new area, which will also be in Albert County, it is proposed to run a pipe line direct to St. John and so give this city new illuminant and fuel. Dr. Henderson is confident that no difficulty will be experienced in securing an abundant gas supply and in bringing it to this city."

S.J. Globe - Mar. 22, 1912 Natural Gas Will Be Used Saturday. - Moncton, N.B., March 22. - Natural gas, which was expected to be turned on at Abrams shop today, will not be turned on until tomorrow morning. A.S. Farmer, who will superintend the gas work, arrived in the city yesterday from Brantford, Pennsylvania."

S.J. Globe - Mar. 23, 1912 Albert Gas Fields and Cumberland's Coal. - British Engineer Makes Favorable Report. - Montreal, March 23. - A great future for the gas fields of New Brunswick and the coal deposits of Cumberland county, N.S., was predicted by Ernest Lichtenberg, English mining engineer, who returned from the east yesterday. He came to Canada at the invitation of Mr. Hanee Logan, ex- M.P. for Cumberland, N.S., for the purpose of an extensive investigation of the varies resources, mineral and other, west of Cumberland, and other sections of the provinces. He declared that the coming ten years would see public notice, now so firmly rivetted on the western provinces, transferred to the eastern part of the Dominion. His estimate of the coal deposits of Cumberland was very favorable, and he will report accordingly on the other side of the Atlantic. Mr. Lichtenberg was surprised at the gas wells of Albert county, N.B., and said that he followed the pipe line, now laid three feet under ground, from Moncton a distance of ten miles, declaring that the industry will be of greatest importance to that part of the country, as the gas will be taken to St. John and all the towns on the

S.J. Globe - Oct. 29, 1912 The Maritime Oilfields Company, which has been drilling for oil and gas at Taylor's Village, will suspend operations there and will start boring at Canaan in a few days."

Kings County Record - Sep. 13, 1912 A well known Sussex resident was told by one of the leading officials of the Maritime Oilfields Limited, in a recent conversation, that the company would at once turn its attention to Sussex and the section of country between here and Albert. If satisfactory indications of gas are located here, it is probable that wells will be sunk at this point. If not, then the gas will be piped from the wells here, and sold to consumers en route. The company propose taking initial steps this fall and if this is done, Sussex should have natural gas before 1914. The news is good. Natural gas cannot reach here too soon. If Sussex is selected for boring purposes, there should be no trouble in piping to St. John at reasonable cost. This would give the city pretty cheap and clean fuel."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - Sep. 19, 1912 and S.J. Standard - Sep. 11, 1912 The Maritime Oilfields Limited have made no definite plans as yet as to the extension of their workings in the direction of Sussex, although they are gradually getting closer to Sussex but the past season proved a bad one for operating. The continuous wet weather made it almost impossible to sink wells anywhere. The company, has Sussex well in mind and it need not surprise residents of the town to see operations started at any time between now and spring."

Campbellton Graphic - Jan. 3, 1913 Natural Gas in I.C.R. Workshops. - Furnished Heat, Light and Power at Big Plant of Government Railway. - Moncton, N.B., Dec. 27 - The workshops of the Intercolonial Railway are now piped with natural gas which is being used extensively for the generating of power. Experiments conducted for sometime have demonstrated that the natural gas could be used more economically and to better purposes than the gas from the railway plant and this to be closed down and held in emergency reserve. ..."

St. Croix Courier - Mar. 6, 1913 Oil and Gas. - The Maritime Oil Fields Limited took 101,430 gallons of crude oil from their wells in Albert County last year. This company has spent almost a quarter of a million dollars in development work. It is expected that natural gas will be piped this year from the gas wells to Dorchester, Sackville and perhaps Amherst. It is already in use in Moncton and Hillsboro with most satisfactory results."

Kings County Record - Nov. 7, 1913 Gas Boring Suspended for the Winter. - Work Will be Resumed in the Spring When Two New Holes to the North and South of the Present Operations Will be Sunk. - The drilling operations for natural gas at Sussex which has been carried on for some time by the Maritime Oilfields, Limited, has been discontinued for the winter, and work will not be carried on any further until next spring, when two additional holes will be sunk to the north and south of the present operations. The well at Sussex which was started just about a mile out of the town showed good indications at first and it was thought that a flow of gas would be struck about fifteen hundred feet down, but as they were boring deeper, the indications were not so good. Everything seemed to be against the company in drilling this well, first it was a lost drill, when the hole swerved and coupled with this was the weather which made it practically impossible for the drillers to make good progress. The drilling was also very hard the soil formation not being the same as that of Stoney Creek, A. Co. When only a short distance down a small flow of gas was discovered which raised the expectations of everybody to a fever pitch, but nothing further in this line was struck. After reaching a point twelve hundred feet down, the company have decided to suspend operations for this year but they will commence again in the spring and finish the present hole also start one at another point as it is believed that there is gas in this vicinity and if the right place is struck, a good flow will be secured. Besides this the drillers and other employees of the company who have been working at Sussex are needed at Stoney Creek where some extensive operations are being carried on at present. The company stated when they started that if the first hole should prove to be a 'duster' that the good people of Sussex must not get discouraged. The whole of the country west of the present productive wells in Albert county down to Sussex is well within the oil and gas belt. It would be folly to forsake any part of a field because the first hole proved dry. The New Brunswick Petroleum Company drilled many holes both in Westmorland and Albert Counties, before they made any discoveries of value. The theory in regard to gas and oil bearing strata near Sussex is nothing new and a thorough investigation will be made. In the spring, operations will start again and the Maritime Oilfields Limited will push to completion the work they have started."

Kings County Record - Nov. 14, 1913 C. P. Boggs Resigns From Maritime Oilfields Company. - Mr. O.P. Boggs, field manager of the Maritime Oilfields Company, has severed his connection with the company on account, it is understood, of some differences of opinion with head officials of the company respecting the matter of drilling operations. It is stated that the drilling operations at Sussex had been suspended recently before Mr. Boggs heard of the matter. Mr. Boggs being ...?... as to the cause of the his resignation had nothing to say, and he also refused to give information regarding the matter. That Mr. Boggs had been successful in his development work in the N.B. field, no one in Moncton will deny, and his resignation will be heard of with deep regret. - Times."

Kings County Record - Nov. 21, 1913 Says No Danger of Gas Giving Out. - N.B. Petroleum Co. to Hire Expert to Look After Their Interests. - 'There is nothing in the stories being circulated about the streets of Moncton to the effect that the natural gas fields are giving out,' said Mr. Matthew Lodge, of the N.B. Petroleum Company when seen by a Transcript reporter. One or two of the wells are filling up with debris and will need to be cleaned, and that is the sole foundation for the story.' Continuing, Mr. Lodge said that the reports to the effect that the I.C.R. was replacing gas with coal as fuel for some of its boilers at the new shops, was based upon the placing of a couple of old locomotive boilers for steaming purposes, at the rear of the new shops. Speaking of the meeting of the Petroleum Company last evening, Mr. Lodge said that the Company had decided to secure the services of an expert to look after its interests and that an offer would probably be made to Mr. O.P. Boggs to accept the position."

Kings County Record - Nov. 21, 1913 New Field Superintendent Maritime Oilfields in Charge. - Mr. William H. King, who has had large experience in the oil and gas business arrived in Moncton on Friday and assumed his new duties as field superintendent for the Maritime Oilfields Company on Saturday, to fill the vacancy caused by the resignation of Mr. O.P.

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - Sep. 21, 1917 New Gas Well Capable of Supplying Two and a Half Million Feet of Gas per Day in Albert County. - A new gas well capable of supplying two and a half million cubic feet of gas per day has just been brought in by the New Brunswick Gas and Oilfields Company. The new well is no. 45 and gas was struck on Friday at a depth of 1892 feet. This is one of several wells upon which the company has been working of late and naturally officials of the company are very much pleased at this further evidence of the extensive gas deposit in the Albert County territory. Well No. 45 is situated to the west of the other producing wells and gives evidence of being a very fine producer. Since striking the gas on Friday men have been engaged ever since closing it up, and only succeeded in accomplishing this Sunday afternoon. Gas consumers in Moncton will learn of the new strike of gas with great satisfaction, especially in view of the impression that had got abroad of a possible shortage this winter. The new well with the possibility of one or two being opened up very soon should certainly relieve the public mind as to the supply of natural gas in the Albert County field
Kings County Record - Dec. 5, 1919 In deepening Well no. 10, situated in the Stony Creek field, on land belonging to Elliot McLatchey, a little over 2,000 feet from the main road, Hillsboro- Moncton, the N.B. Gas and Oil Fields, at the depth of 2,285 feet, struck a gas flow Thursday night, giving an initial open flow of one and a quarter million cubic feet in twenty-

Moncton Daily Transcript, Page 3 - Friday, June 20, 1919 Albert County Happenings - Two gas lights have been erected on the lake drive, Hillsboro."

Kings County Record - Oct. 10, 1919 Deposits of Oil Shales in New Brunswick. - That the Government should authorize the free importation of machinery for the distillation of oil from Canadian oil shales was urged in the Senate, Wednesday, by Senator Domville, in speaking to a motion for a return of imports of petroleum. Senator Domville gave statistics indicating the development of the consumption of petroleum by the world during recent years. He stated that although the growth had been great, it still continued, and continually new sources of petroleum were being sought by companies and by nations, among them Great Britain. In Canada there were great bodies of oil sands and shales from which oil could be commercially extracted. Senator George Fowler supported the request. He stated that although Great Britain was one of the great oil consumers of the world, not four per cent of the oil she consumed was of British production. The development of the New Brunswick deposits would be as easy of accomplishment as had been the distillation of oil from the Scotch shales and would give Canada added capital and labor. Senator Roche, of Halifax, said that there were large deposits of oil shales in Nova Scotia and suggested that the Government should have tests made of their values and the methods of extraction by the Imperial Oil Company which had a large establishment at Halifax. The motion for the return was adopted."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
St. Croix Courier - Apr. 5, 1923 ADVERTISEMENT: Our Maritime Oil Industry. - A Purely Canadian Enterprise. - The sole

Hartman rights for the manufacturing sale of the Hartman Retorts here are vested in and are owned by Newcombe & Winchester. We are interested as citizens in having this industry conducted upon sound business principles as a purely Canadian enterprise. The machinery will be manufactured here and all profits arising from the manufacture and sale of this machinery will be kept here as the property of the Canadian Company. The legal details regarding the organization of this Company are in the hands of our Solicitors, Messrs. Powell and Mersereau, Royal Bank Bldg., St. John. This Company will operate as a subsidiary to the Parent Hartman Process Company. The oil produced will pay a royalty upon every barrel of oil produced. A portion of this royalty will be paid to the Parent Hartman Process Company and a portion of it will be retained by the Canadian Company. We are offering an unequalled opportunity to the Canadian investor so that he may participate not only in the earnings of the Parent Hartman Process Company which will be drawn from all parts of the world where the industry is established, but also directly to participate in the earnings of the Canadian Company. High Quality New Brunswick Shale Oil. - The oil produced from oil shale contains virtually every component of well petroleum and is refined by the same process. A barrel (42 gallons) of shale oil produced from one ton of New Brunswick oil shale will by a proper cracking process produce 28 gallons of gasoline. Great fertilizer values are locked up in our shales. The substantial amount of ammonium-sulphate recovered means great assistance to agriculture. Gas. - Hartman Process machinery operating upon New Brunswick oil shale will produce 5,000 feet gas per ton. The heat necessary to operate the Hartman Retort is produced through the burning of the hydrocarbon coke in the spent shale which is immediately taken to the fire-box by conveyers. With this a portion of the gas is also utilized as fuel. There is left approximately 3,000 feet of gas per ton of shale, which will be released to the market for the usual light and power purposes. The B.T.U. of N.B. shale gas is over 1200, whereas manufactured water gas is approximately 600. The Hartman Process Company is bringing business and capital to the Maritime Provinces. As already announced in the press, prominent shale oil Companies in United States which have ordered Hartman machinery are making their plans to come to New Brunswick on account of the superiority of the New Brunswick oil shale deposits both in regard to the quantity and quality of the oil. They are changing their name to be known as the Canadian- United States Shale Oil Co. Shale Oil Vs. Well Oil. - First:- No dry holes. According to the statement in the St. John press this week, $150,000,000 was expended in Texas the last five years in drilling nonproducing oil wells and the whole charge last year in regard to nonproducing oil properties in United States totalled nearly one billion dollars. Second:- Uniformity of production. Shale oil property is very readily surveyed, the quantity of oil bearing shale is estimated and the assays give the quantity of oil per ton, thus, all the hazards and gambling incident to the drilling of wells is eliminated. The cost of production of shale oil by Hartman machinery upon the New Brunswick and Nova Scotia deposits has been estimated very carefully by able engineers. We shall be very glad to supply all detailed information upon request. Tha Hartman Process Company. - The policy of this Company is that of manufacturing and selling Retorts and the forming of subsidiary Companies in United States, Canada and foreign countries that have oil bearing shale. The Hartman Process Company is the Parent Company controlling the world's rights to all the Hartman patents appertaining to the extraction of oil from shale. From all subsidiary Companies formed this Company retains a royalty of ten cents (10 c.) per barrel for each and every barrel of oil extracted by the use of the Hartman Retorts. With the fast declining oil fields in the United States and the increasing demand for the use of petroleum products there is a tremendous field for the Hartman Retorts. The Hartman Process demonstration plant has been in operation at St. John for a number of months. It has been examined and tested by competent engineers, including Government experts. It has been a fine asset in providing the shale oil owners in Eastern Canada an opportunity to have their oil shales tested in a commercial manner. – To The People of The Maritime Provinces. - Do you realize that we are at the dawn of a new industry. Whilst this great industrial movement is world wide, yet we have right in our midst here in the Maritime Provinces the beginning of the establishment of a great oil industry upon a sound commercial basis. Right at our door we have large oil shale deposits rich in oil. The known quantity of oil actually existing in these deposits situated in the Maritime Provinces runs into millions of barrels. The Hartman Process Company is here with its programme and its machinery which will unlock this wealth and which will mean industrial progress and prosperity to the Maritime Provinces. For a number of months we have been carrying out an educational policy in order to let the people know the value of the shale oil deposits of Eastern Canada and to show how other countries are progressing in these matters and that Canada should not lag behind with such opportunities right at our hand. We have conducted our campaign upon conservative lines, placing before the people different Government reports as to the value of our shale oil deposits and as to the history of this industry. We have placed literature of all kinds and description in Public Libraries and other distributing centres regarding this industry and shall at all times endeavour to give you the fullest information. -- Extraordinary Offer. - We offer a limited amount of the stock of the Hartman Process Company in units. One unit consists of: One share 8 p.c. Preferred Stock, par value $10.00, and one share Common Stock, par value $10.00. Price per Unit $10.00. We are issuing Stock Right's Certificates to purchasers entitling them to shares in the Canadian Company to the value of one-half the money paid for shares in the Parent Company. Cut out the application form, fill in and sign your name and mail, with your check, payable to Newcombe & Winchester. Why Not Sooner? The first question you will ask is 'Why not have these tremendous deposits of shale been commercialized before?' There are two answers. First, that until recently oil wells were able to supply all the petroleum needed. The second and chief reason is that until the invention of the Hartman Process no Retort has proven commercially practicable in handling any and all character of shales. Oil Shortage. - Governments as well as private enterprise are realizing and are frankly stating today that we must now turn to the oil shales to maintain our oil supplies. Gasoline and oil are the most vital necessities of civilization today, but the production is not keeping up with the demand. In the past few years the world has seen the advances of the internal combustion motor which has developed the stupendous increase of automobiles, trucks, tractors, boats and aeroplanes and their use is constantly growing. Gasoline fuel oil and lubricants are today the very life blood of industrial existence. Some of the chief features about the Hartman Retort are: 1. Simplicity of design and construction, no mechanical details to cause trouble or to get out of gear. 2. Continuous in operation, running day and night and manufacturing its own fuel. 3. Large through-put. There are eight Hartman Retorts varying in capacity from 50 to 1000 tons daily through-put. 4. It extracts all the oil and the whole machinery is constructed to produce a superior quality of oil. 5. Low per ton cost of operation. According to the figures complied by the Texas-Louisiana division of the Mid-Continent Oil and Gas Association it is costing $1.36 to produce a barrel of well oil. Hartman machinery operating upon New Brunswick oil shale will produce a high grade oil at a cost at least one-half this figure. 6. Low cost of maintenance. The Hartman Retort when once started in operation requires very little attention, thus saving much in wages, repairs, etc. -- The Company has all the orders that they will be able to fulfill this year in the United States. The Hartman Process Company is fortunate in having as its officers, men of highest personal standing who are experts in their several departments of work. These comprise the following: President and Manager, Mr. E.W. Hartman. Vice-president, Mr. Alfred C. Aitken. Director of Engineering and Construction, and Vice president, Mr. Arthur Driver. Director and Treasurer, Mr. T.K. Edding. Canadian Office, St. John, N.B.; Eastern Office, Boston, Mass.; Western Office, San Francisco, Calif. – ... 192... I hereby subscribe for .... shares of 8 per cent Cumulative Preferred Stock (par value $10.00). And am to receive as bonus .... shares of the Common Stock (par value $10.00) of the Hartman Process Co. I remit herewith Cash, Draft, Check, Money Order for $ ... in ... payment thereof. Carleton Sentinel - Mar. 9, 1923 ADVERTISEMENT: New Brunswick's Coming Industry. Dominion Government Report of 1922: With reference to one Oil Shale property in New Brunswick alone: 'On this basis the average yield for the whole body of shale is estimated to be in the vicinity of forty gallons of oil and fifty-seven pounds of ammonium sulphate per ton. If these conclusions be correct there is here sufficient oil shale to supply a large oil shale industry for upwards of one hundred years.' Oil shale is one of a long list of natural deposits which results from the deposition of organic matter from plants or animals of a former geological era. Shale oil is the product from oil shale which is procured by distillation. Shale oil can be refined to make all the products that come from Well petroleum. New Brunswickshale oil has a very high gasoline content. Shale Oil vs Well Oil: 1. No dry holes. 2. Elimination of hazards incident to drilling wells. The cost of maintaining the present output of oil last year in the United States was $1,000,000,000. This includes drilling expenses and loss from non- productive properties. 3. Uniformity of production. An oil shale deposit is surveyed very easily. As a result of a survey the known quantity of material is ascertained as well as the percentage of oil in each ton. Guess work is eliminated. 4. Oil wells cannot meet present day requirements. Let us forward you reports of the Dominion Government and also of the Government of the United States and State of Colorado which indicate an absolute necessity of immediately turning to oil shale for our oil supplies. 5. Oil shale has been discovered near Woodstock. Samples are being tested by our plant in St. John. Hartman Plant at St. John: The Demonstration Plant here has been operating for about two months. It has created great interest and received much praise. It has been placed at the disposal of any one owning oil shale in Canada in order that their oil shale be tested. This machinery has been watched and tested by independent engineers. The Dominion Government sent their oil expert from Ottawa last week and we presume that the Government will allow his report to be issued to the public. We find that there is a great need of knowledge concerning oil shale. We are carrying out a policy of education upon these matters and are placing Government reports and other literature in Public Libraries and as fast as we can obtain such literature we are distributing the same among the people. The chief points about the Hartman Retort are simplicity of design, continuous in operation, low cost in maintenance, high quality of oil produced, large through-put, low per ton cost of operation. Mr. Gilbert, the engineer in charge of the plant here has furnished us with statements of the cost of production of New Brunswick shale oil by Hartman Process. These statements have been certified by Mr. Hartman personally. They show that New Brunswick shale oil can be produced at a cost as low as $.42 per barrel. The Hartman process is the most efficient machinery for the commercial extraction of oil from all kinds of oil shale. Experienced Personnel: We have a copy of a sworn statement of the present business of Hartman Process Company. This statement was made as a return made by law to a Government. It shows orders for Retorts of over $2,000,000. These orders had been given by some of the leading oil shale proprietors of the United States. The officers of this Company are experienced, successful, conservative business men who will insure the success of this great enterprise. They are: E.W. Hartman, Executive Dept. Arthur Driver, Director of Engineering and Construction. T.K. Eddins, Treasurer Dept. W.N. Tuller, Law Dept. George B. Clifford, Refining Dept. L.A. Rockwell, Sales Dept. H.W. Hartman, Construction Dept. Major W.A. Pettigrew, Engineering Dept. Clarence S. Walker, Patent Attorney. Donald Johnson, Chemistry Dept. We naturally are not able to print all the detailed information concerning the operation of this Company or the oil shale industry, but we welcome inquiries. Our agents are supplied with all necessary information in writing and we shall be glad to assist you in obtaining information upon any points you may bring up. There should be no safer nor more profitable business that the extraction of oil from shale. The time is opportune; the constantly growing demand in oil products insures a permanent and ever increasing market. A New Brunswick Industry: The Dominion Government report already quoted says: 'It is hoped that operation will start shortly, and that the experience and confidence gained from a Successful industry in the Maritime Provinces will lead to the establishment of similar industries in other parts of Canada'. New Brunswick should not lag behind in these matters. The shale oil industry here would mean increased prosperity for the people of the Maritime Provinces. It would mean an increased revenue for the Province in royalties paid into the Provincial Treasury. We believe that the Hartman Process has already received the confidence of some of the leading oil shale owners of this province and from negotiations in progress there will be Hartman Retorts in operation on New Brunswick oil shale deposits in a short time. The Hartman Process Company is the Parent Company controlling the World's Manufacturing Rights of the Hartman Retorts. The Retorts that are sold throughout the world will return a substantial profit with a royalty of $ .12 1/2 per barrel. The Hartman Process Company is a Massachusetts Trust. Its trustee directors are Mr. E.W. Hartman, Mr. Arthur Driver and Mr. T.K. Eddins. The Boston Office of the Company is at No. 440 Tremont Building. Authorized Capital $15,000,000. 8 P.C. Cumulative Preferred Stock $2,5000,000. Par Value $10.00. Common Stock $12,500.00. Par Value $10.00 All shares fully paid and non-assessable. No bond issue. This stock is offered for sale in various parts of the United States and under our contract we are able to offer a portion in Canada. This stock is sold in units consisting of one share preferred stock and two shares common stock, price $10.00. per unit. We invite the public to visit our plant at Chipman Hill, St. John. The engineer in charge there will give you full explanations. Newcombe & Winchester, stock and bond brokers, Royal Bank Building, St. John, N.B., owning exclusively the stock rights for Canada. The above statements are based on information which we believe to be reliable. Buy Hartman Stock Now. Grover C. Richardson, Woodstock, N.B. Exclusive agent for Woodstock and vicinity Phone, Write or Call for Full Particulars." Telegraph Journal - Sep. 27, 1923 Says Albert Gas Will Soon Run Out. - Moncton, N.B., Sept. 26. - H.B. Gooderich, of Oklahoma, who was engaged by the City Council to inspect the Albert County gas field and report as to the supply at present and available for the future, presented his report at a special meeting of the Council tonight. The report in brief states that, at the present rate of consumption, the supply of gas from the Albert County field may be expected to last about two and a half or three years. If the peak load is taken out, which means gas used for manufacturing purposes and in furnaces, the gas expert stated that the supply of natural gas might last for seven years."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - May 14, 1926 Dr. J.L. Henderson, of London, England, president of the New Brunswick Gas and Oil Fields Co., Ltd., arrived in Moncton last Monday from the Old Country to inspect the work being done in Albert County gas and oil fields in Lower Coverdale. He expects to remain for at least two months. Work on the gas fields has been proceeding for some time and the latest reports indicated that one well was down about 2800 feet, and another about 1700 feet. They do not expect to strike gas in any large quantity until the drillers have gone down about 3000 feet."

Kings County Record - Jan. 27, 1928 Anthroxolite Near Fredericton. - Drilling for Oil and Gas Following a Report from an Expert Mineralogist. - Following definite word from an expert mineralogist that a black mineral found at the farm of George Legassie, New Maryland, about eight miles from the Parliament Buildings in New Brunswick's capital, was anthroxolite, a syndicate has been formed and is now carrying on drilling for oil and gas, which experts believe to be present where anthroxolite has been discovered. For carrying on the drilling and development operations, a syndicate has been formed locally and includes in its personnel Mr. Legassie, the owner of the property. In the names of members of the original group associated with Mr. Legassie and the syndicate which has been formed licenses to search covering 6,800 acres in the New Maryland District of York County have been taken out. Under the provisions of New Brunswick's new Mining Act ten squares of one quarter of a mile each may be licensed to each person. It is stated that the mineralogist to whom samples of the mineral were submitted has advised that anthroxolite commands a price of $50 per ton, as an ore, and who is further stated to have advised the syndicate that when it is proven oil and gas exists, there should be no difficulty in having an operating company take over operation of the property on a 50-50 basis. Drilling operations have reached a depth of 128 feet, according to the latest reports; it is said that up to the time the drilling reached a depth of more than 40 feet perfectly good drinking water emerged about the drill. As the drilling operations proceeded further, the water became unfit to drink and lately an oily deposit similar to vaseline has formed on the pipe. Experienced drillers on oil operations say they believe this oily deposit is an indication that the dome of the cap has been reached and that oil and gas will soon be struck."

Kings County Record - May 27, 1937 Gas And Oil Company Open Operations For Survey of Penobsquis Area Ground. - Investigation of Possibilities Continue as Company Stakes Off Large Block. - Should Cause Boom. - Official Indicates That Well Drilling Will Be Started In Near Future. - Reports have been coming in from the region of Penobsquis during the past few days, that indicate that drilling for oil will shortly be started. It is understood that experts for the New Brunswick Gas And Oil Fields, Ltd., have been making an extensive survey of the Sussex-Penobsquis area with a view to developing the oil and gas that has long been believed to be beneath the earth's surface in this locality. Just where this investigation is being centered has not been as yet disclosed, and it would appear that the experts are hesitant about disclosing the whereabouts of their possible drilling operations in case the survey should prove not quite as successful as had been anticipated. Second Survey. - This news recalls the fact that shortly before the Great War drilling began in the area near Sussex, but was abandoned. This, too, was carried on by the same company that is renewing investigations of the situation. Both natural gas and oil seems to be the objective of the experts' survey, and there seems little doubt, but that the investigators consider the effort worth while. Reports of these investigations have been confirmed in Saint John by Mr. Alex. Crichton, an official of the New Brunswick Gas & Oil Fields Co. Ltd., which organization holds mining rights over a large portion of this province. He would say little regarding the immediate plans of his company, but indicated that the actual drilling would get under way in the near future. Learning Title. - Apparently the present plans involve the business of finding out who owns the land on which the investigations are being conducted, and finding out the holdings, and titles, etc., of areas where geological experiments would in all probability be carried out. It is understood that other spots in New Brunswick are also being tested for the present of gas and oil in sufficient quantities to make working practicable. The official approached in Saint John pointed out that the presence of gas and oil could not be immediately determined. Sometimes it requires a year of drilling to make any exact estimate of the volume. The city officials are interested in the project to the extent that a supply of natural gas might be available. Staking Lines. - Information from Penobsquis, gleaned by the Record this week, shows that a claim line is being surveyed. A. Munro, a surveyor from Moncton, is doing the work, assisted by two local men, A.B. Robinson and Bert Weldon. This district is being surveyed as far as Cardwell and Picadilly and most of the investigated ground lies between Penobsquis and Sussex. With the granting of the land to the early pioneers, the mining rights went with them to the settler, but the new grants do not embody this point. It is expected that the drilling will be done somewhere near to the village of Penobsquis."

Kings County Record - Oct. 23, 1947 The geological make-up of New Brunswick was described to members of the Kiwanis Club of Sussex at their weekly dinner meeting last Thursday evening in St. Paul's Church Hall when Robert Brown, Ottawa, who is engaged on a survey for an oil company, spoke on 'Local Geology.'"

Kings County Record - Aug. 12, 1948 Shell Drill Works Below 3,000 Feet. - An inspection of the test well being sunk at Urney by Shell Exploration New Brunswick Limited was made last week by T.R. Grieve, Toronto, vice president, operations, of the Shell Oil Company of Canada Limited. Mr. Greive was in Sussex Friday and Saturday. He also visited the Apohaqui site where Shell's next test will be drilled Also in Sussex was Dr. W.C. Gussow, Ottawa, chief geologist of the Shell firm in Canada. Geological parties are continuing their operations in this area. A.D. Kingsford, manager of Shell Exploration New Brunswick Limited, revealed the test well at Urney already has been drilled tp a depth of more than 3,000 feet. No oil in commercial quantities has been encountered. Mr. Kingsford pointed out drilling still is in the Albert formation, and if oil is located, it probably will be in such a formation, he added. A tentative schedule for drilling at Apohaqui to start early next month when the Urney well is completed, but Mr. Kingsford continued that it is impossible to make more than tentative plans until the work at Urney is finished."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - Dec. 9, 1948 Quarter Mile Deep. - Drilling of a test well by Shell Exploration New Brunswick Limited on the Apohaqui property of Robert Anderson has progressed beyond a depth of a quarter of a mile, it is stated by A.D. Kingsford, manager. By Monday morning the drill had penetrated to a depth of 1,568 feet. Mr. Kingsford said drilling had been difficult at the Apohaqui site since the equipment was moved there from Urney several weeks ago. So far there has been no indication of oil on a production basis, he added."

Kings County Record - Jul. 1, 1948 Drillers At Urney Down 1,000 Feet. - The thousand-foot mark was passed during the weekend by the Shell Exploration New Brunswick Limited in drilling its test oil well on the property of Blair Colpitts, Urney, it is announced by A.D. Kingsford, manager. Drilling on the property started just a month ago as the Shell company began a program which calls for at least one more test well to be sunk in the general vicinity of Sussex this summer. The Urney well may be sunk to a depth of 4,000 or 5,000 feet. Mr. Kingsford said the drillers had encountered a large amount of hard sandstone which made operations difficult. In several places there were indications there had been oil in the past, but this either had dried up or moved to new reservoirs, he added. Work at one or two additional sites of necessity will be delayed until the present drilling operations are completed because the company has only one drill in this area, Mr. Kingsford said."

Kings County Record - Jul. 8, 1948 Will Sink Test Oil Well Near Apohaqui. - Officials of Shell Oil Exploration, New Brunswick Limited, announced today the location of their next well in the Sussex area. This well, The Record is informed, is to be drilled on Robert Anderson's farm near the village of Apohaqui; and the actual site for the shaft is situated about two miles from the railway station at Apohaqui. Construction of a road to the site will start on Tuesday next. It was pointed out by the officials in charge of the work that the sinking of the new well will not be started until completion of the well mow

Kings County Record - Jul. 22, 1948 Shell Encouraged By Drill Results. - Indications from the Shell Exploration New Brunswick Limited drilling at Urney have been 'somewhat encouraged', it was stated yesterday by A.D. Kingsford, company manager, although he added 'no accurate forecast can be made for success or failure' at present. Mr. Kingsford said drilling had progressed to a depth of 1836 feet Monday in the test well being sunk on the property of Blair Colpitts at Urney. Production tests so far proved negative, he continued. What may be found in the future is 'a matter of waiting to see what the drill will disclose', he said. A road has been constructed to the location for the second test well to be sunk in the Sussex area, on the farm of Robert Anderson, Apohaqui, and the site has been levelled to receive the drilling equipment on completion of the well at Urney. P.M. Fowlie, Toronto, president of Shell Oil Company of Canada, Limited, was in Sussex Tuesday and visited the sites at Urney and Apohaqui."

Kings County Record - Jun. 3, 1948 Actual Drilling Starts At Urney. - Veteran drillers from the oilfields of Texas late Monday for oil on the property of Blair Colpitts at Urney, a few hours in advance of the June 1 date set for actual work to begin by the Shell Exploration New Brunswick Limited, Shell Oil Company of Canada subsidiary. Heavy drilling equipment was moved from Sussex to Urney, 10 miles eastward, last week in preparation forthe first of two or three test wells which will be started this year in the vicinity of Sussex. No difficulty was experienced in the move. A roadway had been built from the Urney road to the site of the drilling before the equipment was moved. The drills bit 45 feet into the ground before the first day's abbreviated operations ended."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - May 20, 1948 Shell Oil To Drill in Kings County. - Preparatory Work Begun This Week in Urney Section. - Results of Test Wells Expected to Be Known By September. - Shell Exploration New Brunswick Limited, a subsidiary of Shell Oil Company of Canada, will start drilling a test well near Urney next month. The Shell company decided to proceed with test drilling as a result of preliminary geological work carried out by company personnel last year. The first test well will be drilled on the farm of Blair Colpitts, near Urney, and present plans envisage the drilling of at least one, possible two, more test wells in other areas in the vicinity of Sussex. A.D. Kingsford, general manager, of Shell Exploration New Brunswick Limited, is in charge of the operations. He is making his headquarters in Sussex. A peg marking the exact position of the well near Urney, 10 miles east of Sussex, was driven yesterday morning. To Build Road. - Construction of a road to the site will commence immediately. The contract for this work has been let to the Stewart Construction Company, Sussex. Some drillers already have arrived, with the first reaching Sussex Tuesday. A camp has been set up for the, at Camp Sussex, where the offices also are located. Racks are being constructed to accommodate the supplies of casing and pipe, which are arriving daily. Drilling equipment, being shipped from Texas, is on its way and is expected some time within the next week. Company Statement. - In a prepared statement released to the press for publication last Saturday, the company said: 'Following upon the preliminary geological work carried out by Shell Exploration New Brunswick Limited in the summer of last year, this company now has completed plans to drill its first test well about 10 miles east of Sussex. 'In addition to this well the company's present plans envisage the drilling of at least one, and possibly two, more exploratory test wells in other areas. It is hoped that these may be commenced this year. 'The first well is intended to test the Albert formation and it may be necessary to drill to a depth of 4,000 to 5,000 feet to accomplish this. It is hoped to commence drilling early in June, and final results should be forthcoming by September, depending on the depth of the well. 'It is interesting to note the Albert formation yields gas in the Stony Creek field which supplies the City of Moncton. 'One of the latest types of mobile rotary drilling outfits is to be used on the well. The equipment is now in transit from Texas, U.S.A., and should arrive in Sussex during the coming week. The major components are all mounted on one large six-wheel drive truck, including two 125 h.p. Cummins diesel engines which form the main power unit. To Train Crews. - 'Three American drillers will be on hand for the first few weeks to train Canadian crews in the operation of the equipment. 'Three large huts in the army camp at Sussex have been converted into living quarters and mess for the drilling and seismic crews. Officers and warehouses are also established there. The total staff that will be employed in New Brunswick this summer will be in the neighborhood of 50 men, including drilling and seismic crews, geological parties, office staff and engineers. More Surveys. - 'Shell is also arranging to continue its geological work during the summer months of 1948 with three field parties as well as other supervisory geologists. It has been fortunate in obtaining the services of several graduates and undergraduates from University of New Brunswick and postgraduates have been drawn from Queen's University, McGill and Toronto. 'Shell is planning some extensive experimental seismic work which, if successful, will be expanded to form an important part in the company's exploration program. 'Seismic work involves the drilling of shallow 'shot' holes in which small charges of dynamite are exploded. 'A contract for drilling the 'shot' holes has already been entered into with Ellis Perry, Sharles Beer and Joe Price, well drilling contractors of Petitcodiac, New Brunswick. The Heiland Exploration Company of Shreveport, Louisiana, will do the seismic work and key personnel and equipment for this purpose are being despatched from as far away as Denver, Colorado, and Edmonton, Alberta. Geological and seismic work, as in 1947, will be under the direction of Dr. W.C. Gussow, the Shell Oil Company of Canada's chief geologist for

Kings County Record - May 20, 1948 Welcome to Shell Oil. - The announcement that Shell Exploration New Brunswick Limited, an offshoot of the great Shell Oil Company, is to commence drilling in Kings County this summer brings great satisfaction to this part of the country. It is too early yet to start considering Kings County as an oil centre. Results of this summer's work will not be known for several months yet. Oil in commercial quantities may be found, or it may not. If it is, Kings County is due for its greatest boom for many a year; if it isn't, nothing has been lost. Shell decided upon a drilling program for this section of New Brunswick last year after making a geological survey. What was found then was of sufficient importance to cause the company this year to bring in drilling equipment and crews from Texas, and experts from other parts of Canada and the United States. In all, about 50 men will be employed in the general vicinity of Sussex this summer to learn about the oil content of Kings County land. The people of Kings County wish Shell Exploration New

Kings County Record - May 27, 1948 Drilling Starts Next Week As Urney Property Prepared For Operations By Shell Oil. -

Equipment and Drillers Reach Sussex As Road Completed to Well Site. - Camp Set Up.- Offices and Living Quarters Occupy Former Army Buildings Here. - Drilling for oil at Urney will be started next week, it was stated yesterday by A.D. Kingsford, general manager of Shell Exploration New Brunswick Limited, a subsidiary of Shell Oil Company of Canada. Drilling equipment has arrived from Texas and is being unloaded at Camp Sussex, where the company is making its headquarters. One shed formerly used for ordnance stores has been taken over as a warehouse. Four expert drillers have reached Sussex from the Texas oil fields. A road into the drilling site, on the farm of Blair Colpitts, was completed this week, and the first equipment was moved at once. The company's road is about 600 yards long. A huge truck and large engine which provide power for drilling, and the derrick are the heaviest items of equipment which are to be moved to Urney, 10 miles east of Sussex. Pipe Arrives. - Thousands of feet of pipe, of varying sizes, have arrived in Sussex. A company statement announcing the drilling plans said it may be necessary to go down 4,000 or 5,000 feet in the operations. A self-contained camp has been set up in the ordnance lines at Camp Sussex, where three buildings, other than the warehouse, are being used. One building is taken up with office space; another is used for living, eating and recreation quarters for the field and office staffs; and the third contains office and living quarters for the geological staff, which will continue its search for additional likely drilling places in this vicinity."

Kings County Record - Nov. 4, 1948 The test well being drilled by Shell Exploration New Brunswick Limited, on the property of Robert Anderson, Apohaqui, had reached a depth of 328 feet by yesterday morning, it was learned at the company's offices in Sussex. Drilling at Apohaqui started about two weeks ago after a test well more than a mile deep had been sunk

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - Oct. 28, 1948 Drilling Started At Apohaqui As Shell Exploration Closes Test Well On Urney Farm. - Work Stopped After Boring More Than Mile In Albert Formation. - Hunt Continues. - Seismic Crews Scour Kings County For Other Possible Drilling Sites. - Shell Exploration New Brunswick Limited began sinking its second test well in the Sussex area last Friday at Apohaqui after abandoning one which has been pushed more than one mile into the ground at Urney. The second well is being sunk on the property of Robert Anderson, on the back road between Apohaqui and Norton at a point about two miles from Apohaqui station. Drilling at Urney on a farm owned by Blair Colpitts, had been started about June 1 and was carried on until a depth of 5,343 feet had been reached. Progress had been slow during the closing weeks because the light equipment was working far below its normal depth. It had been hoped to ascertain the depth of the Albert formation at Urney, as a guide for drilling at other points, but when the operation there was suspended the drill still was going through that type of ground. Officials hope the Apohaqui drilling may provide the answer to the thickness of the Albert formation. Four-Day Move. - Four days were required to move the drilling equipment from Urney and set it up at the new site. To ensure that none of the valuable drilling equipment would be damaged on the move, the provincial department of highways reinforced several bridges along the route to carry the heavy loads safely, Shell officials stated. Slow progress was made through very difficult rock formation when drilling started at Apohaqui, and by Monday morning the drill had pushed down only 192 feet. Seismic work is being continued in the Sussex vicinity as the Shell company seeks possible future drilling sites. This consists of drilling shallow wells, usually about 100 feet deep, setting off dynamite charges in the holes and recording the resultant vibration. The Heiland Exploration Company Limited is making the seismic tests for Shell."

Kings County Record - Sep. 30, 1948Shell Drill Works Below 5,000 Feet. - Shell Exploration New Brunswick Limited has passed the 5,000 foot mark in its test well at Urney, and Tuesday was going strong at a depth of 5,083 feet. A.D. Kingsford, manager, said the well probably will go down several hundred feet more before drilling there is discontinued. When the work at Urney is finished, the equipment will be moved to another site near Apohaqui where a second test well will be drilled. Shell began drilling operations at Urney about June 1."

Kings County Record - Apr. 28, 1949 Shell Exploration To Move Offices, Keep Stores Here. - New Headquarters For New Brunswick To Be Established in Moncton. - Shell Exploration New Brunswick Limited will move its offices from Sussex to Moncton next week, it was announced yesterday by A.D. Kingsford, manager. Pending clarification of the company's program in New Brunswick, drilling equipment, casing, piping and spare parts will be left in Sussex, where the company has made its headquarters for the past year. It is probable the spare parts will be kept here while operations are centralized in southern New Brunswick. Mr. Kingsford said that in moving the company's offices to Moncton, where geologic and seismic groups have been located for several months, the policy of keeping the office staff centralized is being followed. The drillers and field men are not likely to leave Sussex until more definite information on future drilling is available. In Three Counties. - The seismic and geological work in recent months has been done in Kent, Gloucester and Westmorland counties. Shell Exploration sank two test wells in the Sussex area last year. One, at Urney, was pushed down more than a mile without breaking through the Albert formation. A second, near Apohaqui, penetrated the Albert formation at a little more then 2,000 feet. Drilling at Urney lasted for several months; at Apohaqui only a few weeks."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - Jan. 6, 1949 Shell Steps Up Oil Search Through Seismograph Work As Drilling Stops For Time. - Sussex Remains Headquarters of Widespread Hunt in Southern N.B. - Finish At Apohaqui. - Bottom of Albert Formation There Reached at Depth of 2,472 Feet. - Shell Exploration New Brunswick Limited will concentrate on geological and

seismograph work for the next few months in its search for oil in southern New Brunswick, it has been announced by the company headquarters in Sussex. Drilling has been discontinued at Apohaqui, where the second test well to be sunk in Kings county was completed at a depth of 2,472 feet after the drill had penetrated to the bottom of the Albert formation there. An earlier well, at Urney, had been drilled to a depth of more than 5,300 feet without getting to the bottom of the Albert formation. It was pointed out the company is intensifying its search for oil despite discontinuance of drilling, which will be resumed at a later date. The change in policy has made it necessary to lay off the drilling crews which were engaged locally and trained when the company operations started here last spring, but trained drillers who were brought here from other Shell Oil Company of Canada Limited undertakings are remaining in Sussex, from where the subsidiary company will continue to operate. It is expected the local drilling crews will be re-engaged when drilling is started again. President Here. - The following press release was issued following a visit to Sussex and other New Brunswick centres by W.M.V. Ash, president of Shell Oil Company of Canada, Limited: Shell Exploration New Brunswick Limited has just completed its second well in the Sussex district. This well, Apohaqui No. 1, was drilled to 2,472 feet. No oil was discovered but valuable information was obtained which will be used in Shell's plans for a still further intensified search for oil in New Brunswick. The Shell Oil Company of Canada, Limited, through its subsidiary Shell Exploration New Brunswick Limited carried on active exploration in New Brunswick throughout 1948. Shell is seeking oil production in the Mississippian sediments which are exposed in southern New Brunswick and underlie strata in the eastern and central areas. During the past summer one geological party completed detailed mapping of the Mississippian area and two field parties mapped the eastern and central areas. One seismograph party of Heiland Exploration Company has been operating in the Mississippian area since May 1948. Start in June. - Drilling commenced June 1 on Shell's first wildcat, Urney No. 1, located eight miles east of the town of Sussex and 36 miles southwest of the Stony Creek gas and oil field, which supplies the City of Moncton with natural gas. Production of gas and oil in the Stony Creek field is obtained from the Albert formation. Urney No. 1 is spudded in the Albert formation and on the axis of a closed anticlinal structure. The well was completed and abandoned in the basal part of the Albert formation at 5,343 feet. It is probable that Shell will not be undertaking further drilling until late in the spring or early summer of 1949. Meanwhile the company will concentrate on further geophysical work, particularly seismograph operations, and will include refraction work in addition to reflection work of the type previously carried out. Shell is also contemplating using a gravimetric survey party in the field. These plans for geophysical exploration go hand in hand with future drilling plans. In fact it is hoped that the increased geophysical work will enable Shell's drilling operations to proceed more rapidly than hitherto."

Kings County Record - Jan. 20, 1949 Shell Oil Hunt Shifts To Kent; Offices Remain. - Seismic Work to be Concentrated on New Area of Province. - Shell Exploration New Brunswick will make its next major offensive in the fight to locate oil in New Brunswick in the central part of Kent County, it was announced yesterday by A.D. Kingsford, manager, from the company's offices in Sussex. Seismic work in Kent county will be carried on by the Heiland Exploration Company, which has been operating from Sussex since last summer, covering a wide area of southern New Brunswick. Meanwhile, experts of the Shell Oil Company of Canada, parent body of the New Brunswick company, are studying the seismic reports already made to determine where the next test well will be drilled. Drilling was suspended at Apohaqui, second test well sunk in the Sussex area, three or four weeks ago when the Albert formation had been penetrated without trace of oil in commercial quantities. Further drilling, it is expected, will be undertaken later this year. Temporary Moves. - Because of the temporary cessation of drilling several changes have been made in the company's personnel here, and some of the staff have left, or are leaving at the beginning of next week, for work elsewhere. Most of them are expected to return to Sussex when new drilling is undertaken. Rex Hague, who had been office manager in Sussex, has been transferred to Toronto and has been replaced by M.L. Gregg. A.L. Oliphant left Tuesday for Toronto, accompanied by Mrs. Oliphant. Fred Kidd, resident geologist and co-ordinator has been moved to Moncton where he will be close to the Kent County seismic work. Mr. Kingsford and Eddie Chaput, assistant to the drilling superintendent, are leaving the first of next week for Houston, Texas, where they will join Angus McNeill, drilling superintendent, and A.F. Halcrow, exploration engineer. The four will be acquiring experience on types of drilling which might be encountered in New Brunswick. It is expected they will return here in about two months. Ivan S. Thomas, a member of the office staff, has been posted to Toronto during the quiet period. He also is expected to return later. Heiland Exploration Company has moved its headquarters to Moncton. The company is engaged by Shell to test the underground make-up of areas considered as possible oil sites as a result of geological surveys."

Kings County Record - Jun. 2, 1949 A.D. Kingsford, manager of Shell Exploration New Brunswick Limited, Mrs. Kingsford and their small sons, Patrick and Douglas, left early this week for Brule Beach, where they will spend the summer. The Shell company has moved its New Brunswick headquarters from Sussex to Moncton. Drilling equipment and drilling crews have not been moved from here yet."

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
Kings County Record - Jun. 23, 1949 Shell Equipment Moved For Well Near Dorchester. - Oil Company Retains Sussex for Warehouse and Stocks of Pipes. - Drilling equipment of Shell Exploration New Brunswick Limited was moved this week from Sussex to the site of the company's third test well in New Brunswick, near Dorchester in Westmorland county. The two previous test wells sunk by Shell in New Brunswick were at Urney and Apohaqui in Kings County. Accompanying the drilling equipment were the crews which had been assembled in Sussex last year, when drilling in the province started. The crews consist mainly of local men who work under the guidance of Shell's experts. A.D. Kingsford, manager of Shell

Exploration New Brunswick Limited, which recently moved its head office from Sussex to Moncton, said it is intended to leave the main warehouse and storage yard in Sussex, setting up an operating supply of materials at Dorchester. Transfer of the drilling rig and equipment commenced Monday, with the Stewart Construction Company, Sussex, handling the move. The 40-ton drilling truck, proceeding to Dorchester under its own power, was moved through Moncton under police escort, and attracted much interest. Before the machinery could be moved to the new drilling site, on the Memramcook River, large quantities of gravel had to be used to make a roadway capable of holding the heavy equipment on the marshy land. The new location is eight miles from the nearest producing well in the Stony Creek field. The location is the culmination of an intensive geological and seismic exploration program conducted over the past three years and climaxing with the reflection profiles shot in the area within the last few weeks. Where the previous two tests started in the Albert formation, this test is commencing considerably higher stratigraphically. The drill site is located on silts of the Memramcook River, entailing considerable work in preparing a road and building timber mats for the drilling equipment. The test is expected to be deeper than anything so far attempted by Shell in New Brunswick and will be commenced immediately. The drilling outfit used on the two previous tests at Urney and Apohaqui in Kings county will be moved in to commence drilling and a heavier outfit will be brought in to complete the well, should it be necessary. In order to augment the information, Shell has commenced a gravity survey of the Dorchester area. This survey is being carried out by Radar Exploration Company Limited of Toronto. The seismic program is being carried on without interruption by the Heiland Exploration Company of Shreveport, La. Both are contractors for Shell. The Sun Oil Company has drilled a deep test near Amherst, a distance of about 15 miles from the present location. This test failed to produce oil or gas and was completed at a depth of more than 11,500 feet."

Kings County Record - Mar. 9, 1950 Shell Company Abandons Search For Oil in New Brunswick. - Shell Exploration New Brunswick Limited has completed its two-year search for oil in New Brunswick, it was announced this week by A.D. Kingsford, manager, from the company's headquarters in Moncton. It is expected the company will close its business in this province by the end of this month. Five test wells were sunk in southern New Brunswick. The first two were in Kings county, at Urney and Apohaqui. The Urney well was begun about June 1, 1948, shortly after headquarters were established at Camp Sussex. The well at Apohaqui was begun in the fall of that year, after that at Urney had been discontinued at a depth of more than 5,000 feet. Drilling at Apohaqui was suspended during the winter of 1948-49. In the spring of last year, Shell Exploration New Brunswick Limited moved its headquarters to Moncton and began further drilling in Westmorland county. One well, at Belliveau Village, near St. Joseph, was abandoned at a depth of 3,414. Another, at Dorchester, was sunk to 3,239 feet after heavy equipment had been brought from the United States. The third Westmorland County well was drilled mainly to obtain geological information, and was sunk to a depth of 1,030 feet midway between Sackville and Shediac. Sussex continued to be a storage centre for Shell Exploration, and Mr. Kingsford said Monday a large supply of pipe and other equipment remains here. Plans for its disposition had not been completed, he said, but it will be moved either to western Canada or the United States. Some of the company's crews already have been transferred to western Canada, and others are expected to follow about the middle of this month. Several have visited Sussex within the past few days to say goodbye to friends made while they were stationed here. Mr. Kingsford said there was genuine regret felt by many at leaving New Brunswick, where they had made numerous friends. It was reported Shell exploration New Brunswick Limited spent more than $2,000,000 in its search for oil in this province."

St. Croix Courier - Aug. 4, 1955Test Six Oil Wells Near Moncton. - PHOTO - Caption - A crew from O.H. Parker Oil Producers sets the stage for drilling and fracture tests at the Oklahoma company's No. 1 three test well site about one half mile from its no. one well at Stoney Creek, a few miles south of Moncton. Under an exploration program contract with New Brunswick Oilfields Ltd., the Parker firm is drilling and fracture testing six wells on the New Brunswick company's 46 year-old Stoney Creek oil field. Drilling and fracture tests at the no. one well indicate an oil production potential of 496 barrels per day. - (New Brunswick Government Photo.)"

St. Croix Courier - Aug. 4, 1955Indicated Potential: 496 Barrels Daily. - PHOTO - Caption - A cable tool machines of O.H. Porter Oil Producers drilling on New Brunswick Oilfield's 46-year- old Stoney Creek field, a few miles south of Moncton, strikes a natural flow of 108 barrels per day at its no. one test well. Fracture tests at four separate levels boosted the combined flow to an oil production potential of 496 barrels per day. - (New Brunswick Government Photo.)"

Codes: E2 / IDX_Names: Oil and Gas - Kings Co.;
St. Croix Courier - Jul. 17, 1958 Oil Search In Maritimes Warms Up. - Tempo of the oil hunt in the Maritime Provinces is stepping up, according to W.L. Dack of the Financial Post. Imperial Oil will drill a second exploratory well in Prince Edward Island as soon as its first drilling venture near Charlottetown is completed. Killarney Oil and Gas Development Co. is drilling a wildcat venture on the outskirts of Fredericton to test oil seepages in the area. Down 1,000 feet on the way to the 3,000 ft. horizon oil shows have already been encountered in the Fredericton try. An oil discovery in the Maritimes would have a big impact on the economy of the eastern provinces, would have special significance for all of Canada, says G.L. Colpitts, producing adviser of Imperial Oil. He lists four reasons for Imperial's current Maritimes oil search: If oil is found, transportation cost to move it to market would be much lower than the western provinces. It would have ready access to markets now supplied by oil brought in from overseas. The area has favorable geology although 'based on present knowledge, it seems unlikely that the area will become completely self sufficient in oil.' Provincial government regulations

in the Maritimes help stimulate private enterprise and thus encourage risk capital to come and explore for natural resources. The crude oil market on the eastern seaboard and Quebec amounts to some 300,000 bbl. daily."

Kings County Record - Mar. 1, 1973 Bay of Fundy Source of Oil? - The petroleum company which discovered gas and oil off the coast of Nova Scotia will carry the search to the Bay of Fundy, Natural Resources Minister A. Edison Stairs announced at Fredericton. Mr. Stairs said the granting of the licence to Mobil Oil Canada Ltd., marks New Brunswick's entry into off-shore exploration. Mobil's licence to explore the Bay of Fundy is coupled with the stipulation that it must operate under the procedures and practices of the Federal Oil and Gas Production and Conservation Act. Details concerning the monitoring and supervision of offshore operations are being discussed to ensure that drilling activities do not have any adverse environmental implications. Mobil Oil was the first major petroleum company to recognize the potential of the eastern continental shelf and was granted licences by Nova Scotia in 1960. After extensive geophysical exploration, the company began drilling in 1967. Four years later, Mobil made Canada's first off-shore oil and gas discovery in the Atlantic shelf in a well drilled on Sable Island, 11 miles west of the 1967 site. Mobil followed the discovery with a gas and condensate discovery in the Atlantic, six miles south of Sable Island. The company has a sea-going rig now drilling between Newfoundland and Nova Scotia. Mr. Stairs said the company plans to evaluate geophysical surveys previously carried out in the Bay of Fundy to determine if conditions are favorable for drilling. New Brunswick and eastern Canada now import most of their crude oil. New Brunswick is still the only province in eastern Canada with a producing oil and gas field. Western Decalta, at Stoney Creek, near Moncton, last year produced 9,000 barrels of oil and 100,000 million cubic feet of gas. A provincial source of petroleum or gas would make this area less dependent on outside sources of supply, promote development of associated industries and help alleviate any local energy shortages that may develop in the years ahead, Mr. Stairs said."

Kings County Record - Jun. 20, 1974 To Search For Oil, Gas in Sussex Area. - Natural Resources Minister A.E. Stairs has announced that a major exploration program will be started in Kings, Westmorland and Albert Counties in the next few weeks. Mr. Stairs said this program will be carried out under the supervision of Kerr-McGee Canada Ltd., Calgary, on a lease granted by the Crown in 1907 and presently held by New Brunswick Oilfields Ltd. The terms and conditions of the New Brunswick Oilfields lease were renegotiated and clarified by the department in 1973. Subsequently, the company Pan Canadian Petroleum Ltd. and United Oils Ltd., all of Calgary, to accelerate the evaluation of the lease prior to acreage drops required by the province. Approximately 100 line miles of seismic exploration will be carried out in 1974. In 1975 the companies may either terminate the agreement or drill three holes to test favorable horizons or structures. Oil seeps were recognized in the province as early as 1859. Initial drilling was carried out in the Dover area near Memramcook. Nearly 80 wells were drilled and about half of them produce 0.5 to 2.5 barrels of oil per day. The field was later abandoned because of water problems, low production and low prices, as well as improper drilling and completion methods. Interest in the petroleum potential of the province was later revived, and the Stoney Creek oil-gas field near Hillsboro was discovered in 1909. Over 150 exploratory and development holes were drilled. The most recent was a dry hole at Urney, near Sussex, drilled by New Brunswick Oilfields in 1973. Total accumulative production from the Stoney Creek field is approximately 750,000 barrels of oil and 27 billion cubic feet of gas. Pressures have dropped over the life of the field from 800 pounds per square inch to 3.0-7.0 pounds per square inch. Production from this field in 1973 totalled 9,687 barrels of oil and 81,481 million cubic feet of gas. The exploration program to be carried in 1974 and 1975 is the first major evaluation of the area since New Brunswick Oilfields entered into a farmout and partnership agreement with Shell Oil Ltd., in 1947 and 1958, respectively. Work will be concentrated in an area between Sussex, Moncton, Memramcook and Hillsboro. Petroleum and gas occurs in sandstone lenses within shales of the Albert Formation, which underlies more than 1,000,000 acres of southeastern New Brunswick. As the Stoney Creek field occupies an area of less than 200 acres, the possibility of discovering additional hydrocarbon accumulates in favorable structures elsewhere in the basin is considered good."

Codes: E2 / A2 / IDX_Names: Oil and Gas - Kings Co.; Albert / Kings County Oil Shales;
Moncton Daily Times - Nov. 23, 1898 Albert County. - Rosedale. - The western end ofthe shale bed, known as the grey shale, is on fire and has been burning for 4 or 5 weeks. It is not known how the fire originated and there is no apparent sign of it going out. The fire is located near the surface, the soil caving in as fast as the fire spreads. Quite a large space is burned out and the intense heat causes the oil to run down the hillside into a stream of water which runs at the foot of the hill where the fire is located. This is indeed a phenomenon rarely seen in this part of the country."

Codes: E2 / A2 / IDX_Names: Oil and Gas - Kings Co.; Albert / Kings County Oil Shales;
Daily Times - Aug. 14, 1899 Oil Boring Project. - Negotiations for Commencing Boring Closed With Boston Capitalists. - Mr. M. Lodge, who returned the latter part of last week from Boston, where he was accompanied by the Hon. H.R. Emmerson, states that negotiations with Boston capitalists for commencing boring for oil in this section were closed last Tuesday afternoon, and the company agree to carry out the provisions of the act passed last winter by the local legislature in regard to the spending of a certain amount of money in search of oil. The company has ordered the necessary machinery for boring purposes, and work will be started as soon as possible, probably within two or three weeks. The Boston capitalists have decided to make this search after receiving the opinion of Prof. N.S. Shaler of Harvard University as to the prospects. Prof. Shaler has explored the territory twice himself and has had three assistants here since the first of June, and he has given the company sufficient data for his opinion that the property should be developed. Mr. Lodge, who has

been at work for some time promoting the oil project, is very much pleased with the success so far attained. He has spent a good deal of time, money and labor in connection with the matter and well deserves to succeed with the enterprise. The idea he has had in regard to this being an oil region is backed up by such men as Prof. Shaler, and the probabilities are that more tangible proof and wisdom of the scheme inaugurated will result from the boring. Test holes for oil will be sunk in different parts of the province. The first boring will probably commence near Moncton. Work is to be commenced at once also at thecannel coal mine at Baltimore, A. Co., and the company feels that also, a number of carloads of the shale will be got out for testing purposes immediately and the stuff tested in Boston. Several tests have already been made and while they have been quite satisfactory, yet the quantity shipped has not been sufficiently large."

Semi-Weekly Telegraph - Aug. 19, 1899 To Bore For Oil. - Holes Will Be Sunk in Albert and Westmorland Counties Within

Three Weeks. - Moncton, Aug. 13. - Hon. H.R. Emmerson and W. Lodge, who returned last week from Boston, completed arrangements with Boston capitalists for commencing boring for oil in various sections of New Brunswick. It is expected that the operations will be begun within three weeks and test holes will be sunk in Westmorland and Albert and North Shore counties. Boring machinery has been ordered and the hiring of men authorized, so that the oil boring and mining projects under promotion for some time past are now assured facts. The enterprise involves the expenditure of one or two hundred thousand dollars in New Brunswick, with bright prospects, so experts who have inspected the territory report to American capitalists, of developing a vast oil industry. The promoters of the project here are very enthusiastic and much elated at the success in forming the company and getting capital put up for explorations. Work is also to be commenced at once getting outcannel coal at Baltimore, Albert County, and this deposit will be tested on a large scale."

Semi-Weekly Telegraph - Aug. 19, 1899 To Bore For Oil. - Machinery to Arrive and a Shaft Sunk at Once. - Moncton, Aug. 15. - The prospects of boring for oil in the vicinity of Moncton to be commenced at once has aroused no little interest in Moncton, and has created a spirit of buoyancy in business circles which bids fair to be felt to some considerable extent. A test hole it is now said, will be sunk on the outskirts of the city and another probably at Memramcook. The machinery ordered for the boring is expected to arrive in a week or two and will be set up at once and will be placed in charge of competent management. Men areto be employed at one mining shale at the cannel mine in Baltimore, Albert county, and as a certain amount of skilled labor will be required it is probably some experienced men may be got from Springhill or other

Daily Times - Nov. 24, 1899 Oil Boring and Mining Matters. - Messrs. John C. Calhoun and Henry Higgins, of New York, are here in the interests of the new company recently formed in connection with the shale mining property situated at Baltimore, A. Co. Mr. Higgins is president of the Petroleum Oil Trust of London, and is one of the directors of the new company to work the Baltimore shale property. He has been down having a look over the property and getting some facts for the purpose of introducing the investment in England. These gentlemen will remain here for a day or two, completing the organization of the company. The new boring machinery in connection with theoil project has been set up at Dover, but the boring will not be continued for a few days yet. Men are at work erecting a derrick and getting ready for another start when the work is to be prosecuted more vigorously than in the past."

St. Croix Courier - Feb. 22, 1900 ... Dealing with the paragraph speaking of the mineral development of the province, Mr. Todd said the explorations in Westmorland and Albert counties were most promising, and we had the opinion of such an eminent expert as Prof. Shaler that the indications of valuable oil and shale deposits in New Brunswick were excellent."

St. Croix Courier - Feb. 22, 1900 ... Dealing with the paragraph speaking of the mineral development of the province, Mr. Todd said the explorations in Westmorland and Albert counties were most promising, and we had the opinion of such an eminent expert as Prof. Shaler that the indications of valuable oil and shale deposits in New Brunswick were excellent."

S.J. Star - May 28, 1901Oil and Shale. - Borings at Memramcook. - British Capital for Albert County. - Moncton, N.B., May 28. - A meeting of the New Brunswick Petroleum and Oil Company was held yesterday. The company is now boring on the grounds of St. Joseph's College, Memramcook, about a hundred yards from the site of last year's borings, where a quantity of oil was struck. When oil sands are reached it is proposed to use explosives and generally to test the value of the property. J.R. McDonald, of New York, and Geo. Abercromby, of London, representing English capitalists, reached Moncton yesterday and proceeded with M. Lodge to look over the Baltimore shale property in Albert county, operations on which it is proposed to resume this year on an extensive scale."

Kings County Record - Dec. 22, 1910 Albert County's Future Now Seems Assured. - Great Works are Planned. Many Other Industries Will Follow in Wake of Oil Refineries. Looks Like Big Thing for Province of New Brunswick. - The great possibilities of the Albert oil shales are hardly appreciated, as yet, in this province. The presence, too, in the same district of an unlimited supply of cheap fuel in the shape of natural gas, will serve to greatly enhance the value of the oil deposits. In many other directions too, the county of Albert has a strong position among the counties of the province and her future, if half that is claimed for her natural wealth, is true, is a commanding one. The Record has been kept in close touch with the situation in Albert for several years past and there is no doubt that the future of the county is assured. It will be remembered that about four years ago, the late Dr. R. W. Ellis, of the Geological Survey, Ottawa, came down to specially investigate the oil shales. He spent several weeks on the ground and left it convinced that what he saw justified the claim that they were among the richest of the kind in the world. His subsequent investigation of conditions in Scotland, where oil shales have been profitably treated for many years, strengthened the opinion he formed of the Albert fields and his report to the government was most encouraging. There was still much to do, however, and from that time down to the sale of one of the big properties to Mackenzie and Mann, of the Canadian Northern Railway, a few weeks ago, there was nothing of a definite character to encourage those interested. Now the situation is much cleared. With men of the business sagacity and enterprise of MacKenzie and Mann behind the enterprise, big things may be expected to follow in short order. They have the entrée to the most exclusive financial circles of the world and their career in the many phases of industrial life of Canada in which they have interested themselves has been nothing short of marvelous. Their presence in any group of financiers means much and there is no reason to suppose that their support to the industry in Albert will not be as enthusiastic as it has been in many other similar situations. The opening of one of the oil properties means of course that others will in turn be developed. The oil shales extend from Baltimore in Albert county, to a point near Norton in Kings. The supply of profitable oil bearing shales is practically unlimited. For years to come there will be ample raw material for the reduction plants, refineries and other industries which will follow in due course the initial development in the district. The fact that natural gas may be had in quantities beyond the dreams of those who first undertook its location, will serve to greatly reduce the cost of production of other lines of manufacturers. Supplied with raw materials from the oil fields many other works can be established and the presence of so cheap natural power and heat will encourage capital to invest in many enterprises. A gentleman who knows Albert conditions well claims that the outside has only been touched in the way of revealing the natural resources of Albert and Kings. Apart altogether from the possibilities of the oil fields, there will be opened up chances for profitable investment which will mean the employment of hundreds and hundreds of hands. The construction of oil refineries and other industries means much in the way of encouragement to transportation companies. Once the immense volumes of freight are provided for shipment, first class railways will be furnished for its transportation and this in turn will be an invitation to promoters of subsidiary plants to come and locate. There are so many lines open, once the venture is under way, that it is useless to try and enumerate them. Of the markets for the oils themselves, it may be said that they have no limit. The call for crude oil for fuel is louder today than ever. Experts are scattered all over the world investigating sources of supply and with the British government constructing more and more warships using oil for fuel, the demand within the empire for crude material will tax the capacity of many such plants as Albert County will see in the next few years. Apart from the production of the raw material there is a market for high class oils which shows a steady gain year in and year out. Then we have another direct production from the oil shales, sulphate of ammonia, which will find a ready sale for fertilizer and the production of which at a low cost will mean much for agriculture in New Brunswick. Among the many lines which may be manufactured profitably in Albert County, it is said that Portland cement will take a leading place. Experts who have tested the oil shales claim that the refuse, after the oil has been extracted will provide excellent material for cement mills. The other ingredients which are needed for the proper production of cement are within easy reach and there is at hand for its manufacture the great fuel supplies which are such a factor in the cost of the manufacture of this greatly used material. The cement age is here and its use is growing by leaps and bounds. Buildings of all kinds are being constructed of cement and with only one cement factory in the whole of the Maritime provinces, the outlook for a big plant in Albert, with water transportation, should be of the brightest. No man can estimate the possibilities of such an industry and the opening up of the oil properties will make it possible. A cement mill such as has been

Codes: E2 / A2 / IDX_Names: Oil and Gas - Kings Co.; Albert / Kings County Oil Shales;
Kings County Record - Aug. 16, 1912 and S.J. Standard - Aug. 16, 1912 The Mineral Wealth Of Kings. - Years ago the Record expressed its belief that the future would reveal very valuable mineral deposits in Kings County. The opinion was based on facts furnished by the late Dr. Ells, one of the brainy men of the Geological Survey staff and an authority on the natural resources of the Maritime provinces. Dr. Ellis was an enthusiast so far as this section of New Brunswick was concerned and it was he who was largely influential in establishing beyond doubt the possibilities and great intrinsic value of the shale deposits of Kings-Albert. Today we have many evidencesthat his faith was well founded. Several years ago the presence of great bodies of natural gas was revealed, and now it is definitely proposed by the operating company that their development be extended to Sussex. At Mt."

Kings County Record - Aug. 5, 1948 Notable Scientist Believed Much Oil Deep Below Sussex. - Operations of the Shell Exploration New Brunswick Limited in the Sussex area brings to mind former days when other authorities on geology felt confident that beneath the earth in the Sussex area there existed great pools of oil. It is recorded that Maitland S. Shaler a noted American geologist paid several visits to Sussex; and it is also recorded that he had declared that he felt certain that beneath Sussex Town itself there was oil in great quantity. Professor Shaler, a graduate in science at Harvard University and who later became a professor in geology, held many important posts in his native land; and finally became president of the United States Geological Society. Professor Shaler came to Sussex in 1898, and spent the summer here. He was interested in the geological formations in the Sussex area. It is recorded that the professor always maintained that there was considerable oil beneath Sussex, and that there had, in ages past, been literally oceans of it. It is recorded that he believed Sussex was located on the bed of a former lake, that, in his opinion there was oil below Sussex. It is recalled that an 'oil' incident occurred some years ago when the Bank of Nova Scotia was being built at the corner of Main and Peter streets. In the excavation for the bank definite traces of oil were found; and strangely enough, several Sussex people saw the definite traces of oil in the basement of the Bank of Nova Scotia house on Church Avenue. Many persons in Sussex, lying in their beds at night, note the vibration of the earth, caused by the passing of a freight train over the area just west of the railway yards. May believe that deep in the ground at that point oil might be lurking, millions of years old, but which could make a town a city in a short time. Operations of the Shell Oil boring crews arebeing watched with interest. The matter of oil existing in large quantities has always been suspected by excavators in the area. A great deal of oil shale has been unearthed in the Sussex area. With the new well to be bored near Lower Cove, it could be the boring machines may divulge the cause of the shaking ground when a heavy train crosses that area."

Codes: E2 / D7 / IDX_Names: Oil and Gas - Kings Co.; Kings County Coal;
Kings County Record - Sep. 6, 1912 The Montreal men who were interested in the coal development at Mount Middleton have withdrawn their plant. The presence of oil at the point where the operations were being carried on discouraged those behind the scheme. An expert, representing oil and gas interests, who visited the property last week, was greatly interested in the work already done and expressed the opinion that oil and gas will both be found on the property in paying quantities. It is understood that there are strong probabilities of work being resumed in the near future with a view to testing the site for oil and gas. An early announcement in regard to the work may be expected."

Morning Journal - May 12, 1865 Professors Bailey and Hind on the Petroleum in New Brunswick. - We shall be unable to do justice to the valuable reports made by these gentlemen, during the sittings of the House of Assembly, but we cannot with hold the following extracts. From Professor Hind's Report:-Petroleum Springs in Albert and Westmorland. -Natural petroleum springs have long been known in these counties. Attempts are now being made to reach the source of supply by boring. The following information respecting the depth of the borings was obtained from workmen at Steeves' Ravine well, in October of the present year:-1. The Steeves Ravine well. - The petroleum spring here has long been known. The oil occurs on the surface of the water in an excavation under the north bank of the ravine. Its odour and colour reminded me of the petroleum wells of Enniskillen in Canada. The depth of the wells was then, (October 15, 1864.) 186 feet. The sand pump brought up fresh water, and very little oil. 2. The Dover well, about three miles north of Hillsborough, on the east side of the Petitcodiac, 106 feet down, with a strong flow of fresh water. 3. Cummins Well, Westmorland County, DorchesterParish, about a mile from the Dover Well, 530 feet down; salt water in the pump, small show of oil. 4. Memramcook, about 140 feet down, very small show of oil. An idea of the depth to which it will be necessary to bore before oil in remunerative abundance may be expected, will be gathered from the fact that the main shaft of the Albert Mines has already been excavated to the depth of one thousand feet, without a trap of oil being met with. It is not probable therefore, with this splendid test well in view, that the prospectors will be successful at a less depth than 1300 or 1500 feet, and it yet remains to be seen to what extent the Devonian Rocks, the probable source of the oil, are developed on that part of the Province. The inflammable gas which is copiously evolved near the Albert Mine, and in several places in Albert County, is not necessarily connected with petroleum, as it proceeds from rocks destitute of bitumen. Conclusions With Reference to Albertite. - As the question of an increased supply of Albertite is one of very considerable moment to the Province, it may not be an unnecessary recapitulation to state briefly and in order the conclusions which have been advanced in preceeding page. It is submitted that it has been shown - 1st. That the Albertite wherever it has been found in situ, occupies fissures produced by dislocations in the rocky strata, or exists as a cementing material in conglomerates, or occurs as an integral part of the rock, as in the Albert Shales. 2nd. That the Albertite, under all circumstances, has been injected from below. 3rd. That there were at least two periods of injection. 4th. That when it occupies fissures, these are on the lines of anticlinal axes. 5th. That it is an inspissated or altered petroleum. 6th. That its source lies beneath the Albert Shales, or in other words beneath the Lower Carboniferous Series. 7th. That it is consequently of Devonian or prior origin, and proceeds probably from rocks of the same age as those which yield the Petroleum of Pennsylvania, Ohio, and Canada. 8th. That it may with confidence be anticipated that a search made in accordance with the views which have been expressed respecting its origin, will result in valuable deposits being found over an extensive area between Dorchester in Westmorland and Norton in King's Counties; but this search must be continued along the lines of anticlinal axes which have been shown to exist within the limits specified. The quantity of Albertite raised since the opening of the Mine in Albert County, is estimated to be about 170,000 tons. At $10 a ton (the minimum price at which I was informed it has been sold), this would amount to one million seven hundred thousand dollars. From Professor Bailey's Report:-Petroleum. - In connection with the discussion of the characters and position of the Albert coal, and the oil-yielding strata of Baltimore, it is interesting to allude to the various points at which the last-named substance has been found to exist as a naturally formed product. The presence of petroleum, or mineral oil, in the Parish of Dorchester, was early recognized by Dr. Robb, Dr. Jackson, and others, but it is only within the last few years that any attempts have been made to open distinct wells. The principal locality at which operations have begun, is that where the presence of this substance was earliest pointed out, viz: the district lying between the Petitcodiac and Memramcook River, near Dover. The ""Westmorland Petroleum Company,"" incorporated in 1864, have erected buildings suitable for their undertaking, and have sunk by boring to a depth of over 400 feet. The rocks passed through, as enumerated in a Report to the Company, are as follows, in descending order:- Blue clay. Shale. Soapstone(?). Blue limestone, full of crevices. Red sandstone. Shales ----, Depth, 90 feet. Several veins of Oil. Sandstone and Conglomerate. Depth 120 feet. An excellent show of Oil. Soapstone (?). Limestone and Conglomerate,

very hard, and with many crevices. Red Sandstone. Grey Shales. Depth 207 feet. Evidence of Copper, the tools coming up coated with that metal. Conglomerates, with Iron and Manganese. Very hard rock. Depth 300 feet. Struck a vein of salt water. Gas strong and burning on the Sand Pump. 60 feet of Black compact Shale. Small vein of Oil below. Conglomerates. Hard rock, Shales and Sandstone - 400 feet; Gas very strong; Struck a vein of salt water and Oil. Sandstone, 430 feet. The general character of the rocks enumerated, would seem to imply that the strata passed through belong near the base of the Lower Carboniferous Series, and are similar to what may be observed at the Manganese Mine, on Shepody Mountain. The so-called Soapstone is probably a fireclay, such as occurs at the last named locality; while the indications of copper and manganese may be due to secondary ores derived from subjacent metamorphic beds. I have not however seen any specimens of the rocks removed, and am therefore unable to pronounce positively on their character. At the time of my visit, operations had been temporarily suspended, during the putting down of copper pipes for pumping. I observed, however, the strong escape of gas from the well, bubbling through a mixture of water and oil, and also observed the latter substance floating on the surfaces of the springs in the vicinity. I have since been informed, that after the sinking of the pipes, several gallons of oil were removed in a single day's pumping. Besides the locality above referred to, petroleum has been observed at several other points in this district, sometimes in a liquid form, escaping with the water of springs, at others in an oxydized condition, forming a thick tarry substance, termed maltha. On the western side of the Petitcodiac, an American Company have undertake to bore for oil, on Steven's Brook, near Hillsborough. At the time of the examination of the locality by Mr. Hartt, operations had but just commenced, and pending the arrival of a steam engine, the boring was carried out by hand. The depth then reached was only twenty five feet, the excavation being made in a friable red sandstone. A few feet from the latter, an adit had been driven into the foot of the hill, and had become partially filled with water, on the surface of which a thick mineral oil was floating by bucketsfull. With the Sandstones of this locality are beds of bluish shale, and compact impure concretionary limestone, with numerous irregular masses of jaspery agate. The last point at which I have had an opportunity of observing the presence of mineral oil, is the neighborhood of Elgin Corner in Albert County, where several of the springs were found to be thoroughly impregnated with this substance, so as to be rendered unfit for ordinary use. The most marked of these springs is on the land of David Steeves, and but a short distance from where we had already recognized the existence of Albert shales. A gas bubbles constantly from the water, and the latter tastes and smells strongly from petroleum. I did not, however, observe any distinct oily films, though the iridescence due to the latter was sometimes present. In attempting to arrive at positive conclusions as to the probable quantity and value of Petroleum in Southern New Brunswick, we are immediately met by the uncertainty which still prevails in other portions of North America, with regard to the origin and mode of action of oil wells. In the absence of certain data from which to judge, we may briefly allude to the principal facts which favour a belief in the existence of the latter in the districts above enumerated. In the first place, the geological age of the formations where these springs occur (already shown to be near the base of the Lower Carboniferous Series), is the same as that of the great oil-regions of Pennsylvania and Ohio. Secondly, the large quantity of Albertite, if the latter be properly regarded as an altered oil, shows the former existence of this substance in a fluid condition, filling cavities in the disturbed strata. If we suppose the greater part of the oil to have become converted into the so-called coal, it is not reasonable to suppose that only a single deposit of the latter exists, and if not, other large beds of Albertite are to be expected, a result as important economically as would be the discovery of oil-wells. Thirdly, the wide area over which actual indications of petroleum have been observed, goes far to indicate the general presence of the latter. It is no objection to such a belief that but trifling quantities of oil have as yet been obtained at the several localities, for such is often the case, where continued search leads to profitable yields. Indeed, so great is the uncertainty attending the discovery of actual wells, that in the Pennsylvania oil-district, according to Professor Evans. ""It is one chance out of many to strike oil at all, even in neighborhoods where it exists in abundance"".

Morning News - Apr. 23, 1856 Machinery Oil. - We are gratified to know, by actual trial and observation, that the new oil, now being manufactured near St. John, out of the Asphaltum coal, by Messrs. J. DeWolf Spurr & Co., is a superior article, and answers all the purposes of the best olive oil when applied to machinery. We have for the last fortnight been using this oil upon our steam engine, and power press. It does not ""gum up"", or corrode, as oils generally do; but works as clean and clear as water. We look upon this discovery as one of the highest importance to the Province. It is an article that will sell readily in any part of the world, at 5s, a gallon. We have the advantage of other countries in its production, in having the coal or raw material in the Province, at Hillsboro'. When ully underway it is going to be a money-making concern. Without any puffing we can safely say that we have tried the article and can fully recommend it for all that it is represented to be. We hope that the enterprise and spirit of Messrs. Spurr & Co. will be rewarded by early and handsome
Carleton Sentinel - Jan. 21, 1856 NEW BRUNSWICK OIL WORKS COMPANY. - We have carefully read the prospectus forwarded to us by the above Company, and recommend its perusal to capitalists, as well as those who take an interest in all efforts to increase the manufacturing energies and capabilities of the Province. On the mercantile and speculative part of the prospectus, we pretend to offer no opinion, other than that the names of the Provisional Directors are prima facie evidence that the calculations of the company are made in good faith. Our desire is merely to direct the public attention to this Company as an important addition to our manufacturing interests. If we have in our Province, a material from which can be made a substitute for anything which is becoming scarce and dear, by all means let us turn it to account, and thereby add our quota to the increased comfort of mankind, and our own wealth at the same time. Such a material the New Brunswick Oil Works Company tell us exists in the County of Albert, and that they have bought the right of turning this substance, by a patent process, into a fine lubricating and burning oil, which they call ""Paraffine"". The material they call (on the authority of Sir Charles Lyell and others) ""Albertite"". From the prospectus it appears that every ton of ""Albertite"" will yield seventy gallons of pure Paraffine oils; that these oils may be produced at the Company's Works at the rate of 350,000 gallons a year, at a cost not exceeding 2s. per gallon; that they are superior to any now in use; that they can be sold at a very low price so as to command a large market, and yet yield a large profit; and that the annual net profit on a proposed capital of £50,000 will be no less a sum than thirty thousand pounds.- COURIER"

N.B. Courier - Jun. 2, 1856 New Brunswick Oil Works Company. - We have carefully read the prospectus forwarded to us by the above Company, and recommend its perusal to capitalists, as well as those who take an interest in all efforts to increase the manufacturing energies and capabilities of the Province. On the mercantile or speculative part of the prospectus, we pretend to offer no opinion, other than that the names of the Provincial Directors are prima facie evidence that the calculations of the Company are made in good faith. - Our desire is merely to direct the public attention to this Company as an important addition to our manufacturing interests. If we have in our Province, a material from which can be made a substitute for anything which is becoming scarce and dear, by all means let us turn it to account, and thereby add our quota to the increased comfort of mankind, and our own wealth at the same time. Such a material the New Brunswick Oil Works Company tell us exists in the County of Albert, and that they have bought the right of turning this substance by a patent process, into a fine lubricating and burning oil, which they call ""Paraffine."" The material they call (on the authority of Sir Charles Lyell and others), Albertite. From the prospectus it appears that every ton of ""Albertite"" will yield seventy gallons of pure paraffine oils; that these oils may be produced at the Company's Works at the rate of 350,000 gallons a year, at a cost not exceeding 2s. per gallon; that they are superior to any now in use; that they can be sold at a very low price so as to command a large market, and yet yield a large profit; and that the annual net profit on a proposed capital of £50,000 will be no less a sum than thirty thousand pounds."

Morning News - Jun. 13, 1856 New Brunswick Oil Works. - We have received a pamphlet containing the prospectus of the New Brunswick Oil Works Company, accompanied with the Act of Incorporation and Bye Laws. They are printed by W.L. Avery, Prince Wm. Street. The Prospectus states that the Company has been organized for the purpose of making Lamp and Lubricating Oils from Albertite and other bituminous substances. One thousand five hundred shares of £10 are open for public subscription. The inducements to invest are all that can be desired."

Codes: E2 / J8 / IDX_Names: Oil and Gas - Kings Co.; Albert Mines;
Daily Sun - Jul. 9, 1904 Hillsboro History. - ... A Departed Industry. - The older residents of Hillsboro will recall the prolonged and expensive litigation which followed the discovery of Albertite, the so-called Albert coal by Gesner in 1850. A difference of opinion immediately arose regarding its true nature, some claiming it was coal, and therefore that it reverted to the crown, others, including Prof. Gesner, that it was not coal but a variety of asphalt and therefore not among the minerals which became the property of the crown. This occasioned a close examination of the new mineral during the progress of the great lawsuit extending over two months at Hillsboro, in which expert opinion of diametrically opposite character was produced by the opposing parties. There were many reasons for believing it asphalt. Its mode of occurrence was wholly unlike that of true beds of coal, occurring as did not in beds, but with all the characters of veins, sometimes parallel to beds but much more frequently occupying a gash or fissure in the rock. It was mined to a depth of 1,400 feet, varying in thickness from eight feet at the surface, with twenty feet as a maximum, down to veinlets barely thicker than a sheet of paper as a minimum. Coal never occurs in this way. Again, Albertite in places occurred as the cement of a conglomerate; and, lastly, its composition is perfectly homogenous throughout, while coal shows a difference in quality. It is a very black, lustrous mineral, breaking with a broad conchoidal fracture and closely resembles the asphalt or mineral pitch of Trinidad. But it was shown by the crown attorneys that Albertite will not dissolve in some of the chemicals which

are solvents of the Trinidad pitch, nor can it be used in caulking a boat. With respect to the first objection it would not now be considered valid, but in the then comparatively initial stages of the study of the extensive class of hydrocarbonates it was erroneously supposed a solvent of the Trinidad pitch should also dissolve the new mineral Albertite if they were related as Gesner claimed. The professor spent his fortune in the endeavor to secure a verdict, but the case was decided in favor of the crown. With a wider knowledge of this class of compounds scientists are now agreed that Prof. Gesner's contention was correct. During the period of its maximum yield, 1868- 1869, the annual production was from 17,000 to 22,000 tons, valued at $15 to $22 per ton at the pit's mouth. After 1890 the veins became too small for profitable working. In all 155,900 tons were shipped from this pocket. The true origin of the Albertite is yet problematical. It shows no signs of vegetable tissue and its only fossils are fishes, to which some have attributed its origin. At an early time it must have been in the form of a fluid, possibly petroleum, and this latter is known to occur in the county. In the old Albert mines the oil used to ooze out of the walls andgalleries. At Dover, in Westmorland, there has been found an oily substance called Maltha, which has oozed from the ground and hardened as pitch. Some are of the opinion that the petroleum turned into Maltha, and subsequently into Albertite where the oil was exposed to the atmosphere. There is, then, this geological reason for believing that oil is, or at any rate has been, abundant in this vicinity and for two years boring operations have been conducted on both sides of the Petitcodiac, with satisfactory results, in search of this valuable commodity. Manganese and shale are found in the parish of Hillsboro and a great deal of money has been spent in developing these extractive industries."

Daily Telegraph - Nov. 17, 1874 Westmorland. - We recently visited Beliveau Village, some 16 miles southeast of Moncton, for the purpose of seeing the locality of a mine which is being opened on the isthmus between the Petitcodiac and Memramcook rivers, opposite Hillsboro. About three quarters of a mile east of the Petitcodiac, Messrs. William Patrick and E.B. Chandler have commenced sinking a shaft for Albertite on land leased from several proprietors, extending from the Memramcook River to the Petitcodiac. The formation, we were informed, extends in an easterly direction for about one mile in Beliveau settlement. Immediately on the bank of the Petitcodiac the formation is dipping west at a high angle opposite Hillsboro, and within a hundred yards of the river, it is dipping northerly. The formation is much the same as that of the Albert mines, about one-fourth to one third of a mile in width, north and south, and about one mile in length. On the south the productive shales are bounded by conglomerate rock, running parallel with them. On the east they are also bounded by conglomerate rock, running north and south about 1 mile from the river. On the north of the productive shales is the oil producing rock, and to the north of that again red marl and freestone. At the bank of the river the western end of the shale is bounded by the same formation as on the north. The productive formation is bounded on the north and west by the red marl and sandstone, and on the south and east by the conglomerate. The Albert Mine is stated to be almost surrounded by conglomerate, with the exception of red marl to the east and northeast. The formation at Beliveau dips northat an angle of from 56ø to 90ø, and in some places is somewhat contorted. At present only small seams of Albertite have been found (some of which we saw) imbedded in the shale, which is highly bituminous and burns well. Operations on the shaft were lately commenced on the bank of the brook flowing towards the Petitcodiac through a ravine formed on either side by hills, those on the productive formation rising from 150 to 200 feet above the bed of the brook. The oil which comes out of the bed of the seams of the rock is exceedingly heavy, sometimes like molasses, and considerable in quantity; it also finds a vent at other places, having a strong smell of petroleum. The shaft is sunk on a fault, and small veins of Albertite are found in the shale in the seams of the fault, and also small seams in the oil producing rock. The shaft, which at present has only progressed some 16 or 17 feet, is being heavily timbered, and is rectangular in form 6 « feet by 10 « feet. As the productive shale of outcrop is south of the pit or oil producing rock, dipping north at a greater or less angle, it comes immediately under the shaft, so that in sinking it, it would come on the Albertite producing shale. The shaft is to be sunk some 500 feet. Mr. Patrick, who is superintending operations, has had considerable experience and success in developing mines in Cumberland. ..."

Calling of first 11. Register to be prima meeting. facie evidence.4. Shareholders to be 12. No dividend for shares members of the in arrear. Corporation. 13. Joint stock alone 5. Liability of responsible. shareholders. 14. Class A shares may be set 5 6. Assessment on shares, apart. when and how to be made. 15. Preference to Class A 7. No transfer of shares shares. in arrear. 16. Other security to Class A 8. What shall be a shares. sufficient discharge. 17. Class B shareholders to 9. Declaration in suits receive six per cent before for calls. Class A receive more. 18. What may be regulated by bye laws. Passed 26th March 1856. Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. That William H. Adams, Joseph A. Crane, James D. Lewin, Edmund Kaye, John Kerr, the Reverend William Scovil, Nathan S. Demill, Thomas E.G. Tisdale, William D.Pickup, Edward L. Thorne, James DeWolf Spurr, John McGrath, John H. Harding, their associates, successors, and assigns, be and they are hereby declared to be a body corporate, by the name of ""The New Brunswick Oil Works Company,"" with all the general powers and privileges made incident to Corporations by Act of Assembly in this Province, for the purpose of trading in, making, or producing oils and other illuminating or lubricating substances, and for purchasing, constructing, establishing, and maintaining all such lands, wharves, buildings, engines, machinery, implements, and things as may be necessary or convenient for carrying on said business and operations, and such other business as may be incidental thereto. 2. The capital stock of the said Corporation shall be fifty thousand pounds of current money of New Brunswick, divided into five thousand shares of ten pounds each. 3. The first meeting of the Corporation for the organization thereof may be called by the said James DeWolf Spurr, or in case of his death, neglect, or refusal, by any one of the parties named, at such time and place as he may appoint, by publishing notice of the same in two of the Newspapers published in the City of Saint John at least one calendar month before such meeting is held. 4. Every person owning a share in the capital stock of the said Company shall be a member thereof, and be entitled to vote at all meetings of the said Company; and members may give as many votes as they own shares, and absent members may vote by proxy, such proxy being a stockholder and authorized in writing. 5. Each and every shareholder in the said Corporation shall be held liable to the said Company for each and every call or assessment made, not however to exceed in amount the stock subscribed to him, for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation or for the purposes 6 of, or to carry on the operations for which the said Company is incorporated, which call or assessment may be sued for by the said Corporation and recovered in any Court of Record within the Province. 6. The Company or the Directors, if empowered by the bye laws of the Corporation, shall have power from time to time to levy and collect assessments upon the shares, or on such of them on which the amount subscribed has not been paid up, of such sums as may be deemed necessary for carrying on the business, or for the purpose or operations of the said Company, and whenever any assessment shall be made as aforesaid, it shall be the duty of the Treasurer or Secretary to give notice thereof in a Newspaper printed and published in the City of Saint John, requiring payment of the same within not less than thirty days; and if any stockholder shall neglect or refuse to pay to the Treasurer the amount of such assessment upon his shares, or any part of such amount at the time prescribed, it shall be the duty of the Treasurer to advertise all such delinquent shares for sale at public auction, giving at least thirty days notice of the time and place of such sale; and all shares upon which the assessment or any part thereof is not paid, with interest from the time such assessment became due, shall be sold to the highest bidder, and after retaining the amount due on such assessment, and interest due thereon, and the expense of advertising and selling, the residue (if any) shall be paid over to the former owner,

and a new certificate or certificates of the shares so sold shall be made and delivered to the purchaser. 7. No shareholder shall be entitled to transfer or vote upon any share after any call shall have been made in respect thereof, until he or she shall have paid all calls for the time being due on every share held by him or them. 8. The said Company shall not be bound to the execution of any trust, whether express, implied, or constructive, to which any of the said shares may be subject, and the receipt in whose name any such share shall stand in the books of the said Company, or if it stands in the name of more parties than one, the receipt of one of the parties named in the Register of stockholders, shall from time to time be a sufficient discharge to the said Company for any dividend or other sum of money payable in respect of such share, notwithstanding any trust to which such share may then be subject, and whether or not the said Company have had notice of such trusts; and the said Company shall not be bound to see to the application of the money paid upon such receipt. 9. In any action or suit to be brought by the said Company against any shareholder to recover any money due for any call, it shall not be necessary to set forth 7 the special matter, but it shall be sufficient for the said Company to declare that the defendant is the holder of one share or more in the said Company, (stating the number of shares) and is indebted to the said Company in the sum of money to which the calls in arrear shall amount, in respect of one call or more upon one share or more, stating the number and amount of each of such calls whereby an action hath accrued to the said Company by virtue of this Act. 10. On the hearing of such action or suit it shall be sufficient to prove that the defendant at the time of making such call was the holder of one share in the said Company, and that such call was in fact made, and such notice thereof given as is directed by this Act; and it shall not be necessary to prove the appointment of the Directors who made such call, nor any other matter whatever, and thereupon the said Company shall be entitled to recover what shall be due upon such call, and interest thereon, unless it shall appear either that any such call exceeds the prescribed amount aforesaid, or that due notice of such call was not given. 11. The production of the Register of the Shareholders shall be prima facie evidence of such defendant being a shareholder, and of the number and amount of his shares. 12. No dividend shall be paid in respect of any share, until all calls then due in respect of that and every other share held by the person to whom such dividend may be payable, shall have been paid. 13. The joint property and stock of the said Company shall alone be responsible for the engagements and debts of the said Company. 14. The Company may at any meeting of shareholders set apart any number of shares of the said Company to be denominated as Class A shares, and all other shares may be designated as Class B Shares. 15. The shareholders of the said Company at any meeting may from time to time grant to the holders of Class A shares in such manner as they may think, a preferential interest or dividend not exceeding six per cent per annum, on such terms and conditions as the said Company may impose. 16. The shareholders of the said Company may from time to time subject and charge, in such manner as they think fit, the lands, goods, and other property, income, and profits, present and future, of the said Company, or such parts thereof as the said Company may think fit, to secure the payment or other satisfaction to the holders of Class A shares, of any interest or dividend aforesaid, not exceeding six per cent as aforesaid. 17. No greater dividend than six per cent per annum shall be made to Class A shareholders until Class B shareholders shall have received full six per cent per annum interest or dividend on the amount of stock paid up by them, with interest on arrears of such individuals, if any. 18. The time and place of holding annual or semi-annual and special meetings of the Corporation, as also the number, eligibility, duties, and powers of Directors, officers, and servants, their continuance in office, removal, or disqualification, and the manner of election or appointment, and any other matter connected with the objects and purposes for which the said Company is incorporated, may be established or regulated by bye laws of the Company made at any meeting of the

Royal Gazette - May 9, 1860 9 Cap. LXXIII. An Act to enable the Victoria Coal and Oil Company of the State of New York to hold property in this Province. Section. Section. 1. Company authorized to hold 2. Company to keep an real and personal estate; Office and Agent in limit Hillsborough. Passed 9th April 1860. Whereas Lyman W. Gilbert, Henry Adams, James A. Alexander, William Hickok, and James Blight, have formed themselves, with their associates, successors, and assigns, into a Joint Stock Company, in the State New York, in the United States of America, by the name of 'The Victoria Coal and Oil Company,' for carrying on Mining and Manufacturing operations in this Province, and are desirous of being enabled to hold real and personal property in this Province, as such Company;-Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. The Victoria Coal and Oil Company of the State of New York aforesaid, and their successors, shall and may by that name have full power and lawful right and authority to have, hold, own and enjoy in any way, real estate and lands of all kinds in this Province, whether in fee simple, or by lease, or in any other way; and to have and to hold personal estate of all kinds in this Province, in any way, and to alienate, encumber, lease, sell or deal with the same in any manner; provided always, that the real estate so owned by the said Company shall not at any one time exceed in value the sum of twenty thousand pounds. 2. The said Company shall keep an Office in Hillsborough, in the County of Albert, in this Province, and an Agent there for the transaction of business connected with the Company in this Province, service upon whom of all processes, notices, and other documents, shall be deemed sufficient service upon the said Company."

Semi-Weekly Telegraph - May 3, 1899 Bills passed.... 2. An act to encourage the discovery and development of Oil and Natural Gas within the Province of New Brunswick."

Gazette - Oct. 28, 1899 N.B. Petroleum Company. - A meeting of the New Brunswick Petroleum Co. Limited, was held at the Brunswick on Wednesday at which about fifteen of the stockholders were present. The meeting was held for organization purposes and officers were elected as follows: Senator King, Chipman, president. Hon. A.D. Richard, Dorchester, first vice president. H.C. Read, Sackville, second vice president. M. Lodge, Moncton, secy treasurer. Board of Dorectors - Hon. G.G. King, Hon. A.D. Richard, M. Lodge, H.C. Read, A.P. Barnhill, Ernest Hutchinson and Willard Kitchen. The meeting of directors was adjourned to Monday, 30th inst. at 15 o'clock and the meeting of stockholders was further adjourned to the same date at 16 o'clock to complete organization. - Moncton Times."

St. Croix Courier - May 8, 1958 Unveils New Government Policy. - Buchanan Forecasts Expanded Search To Find N.B. Oil, Gas. - A more vigorous exploration and developmentprogram of New Brunswick's oil and gas resources was forecast in Fredericton last week by Lands and Mines Minister Norman B. Buchanan. In a statement to a legislative committee, before prorogation of the 1958 sitting of the house, Mr. Buchanan outlined modifications to a lease between New Brunswick Oilfields Limited and the provincial government. Mr. Buchanan said the modifications 'should correct some of the disadvantages which formerly obtained and make possible a more vigorous exploration campaign, covering far wider areas of the province than heretofore.' The text of his statement follows: Co-operation. - 'The subject of natural resources potential has engaged the attention of every government in the world during the past few years. The government of New Brunswick for some time has been giving great attention to the problem of increased utilization of our natural resources so that more direct benefit will be secured. 'I am very glad to say that in the course of our investigations and consideration of the problems involved, we have received a very generous measure of c0- operation from the private companies which have leased or have in some other way secured development rights for resources held by the crown. 'Mention has been made of the possibilities of increased utilization of our forest resources and the matter of mineral resources has received a great deal of attention during the present session. 'Now I am pleased to be able to inform the committee that another phase of natural resource development has been receiving careful thought and reconsideration. Moreover, with the co-operation of the private interests connected with this particular resource, the government, through the department of lands and mines has been able to work out details of a new policy which should prove of great benefit to the economy of the province. 'I refer to the prospects of developing the resource potential of petroleum and natural gas in the province - resources which have produced tremendous wealth for the governments of some of the western provinces. Lease of 1907. - 'The development of petroleum and natural gas resources in New Brunswick is almost entirely based upon a lease which was issued to the New Brunswick Petroleum Company Aug. 16th, 1907. This was the Lease 115 which covered 10,000 square miles (6,400,000 acres) of areas in the southern and central portions of the province. 'The developments which have taken place as a result of this lease pretty well comprise the history of exploratory and industrial utilization in the past 50 years. 'In 1909 active exploration began in the so called Stony Creek field in Albert county.An important natural gas discovery was made which resulted in the introduction of natural gas into the city of Moncton in 1911 and considerable industrial expansion in the Moncton area in the next few years. 'From 1909 until 1940 various companies and agencies operated under the lease for exploration and development purposes. Records indicate that 126 wells were drilled in that period with the deepest going down to 4500 feet. Most of these were in the Stony Creek field. 'From 1909 to 1955, the Stony Creek field has delivered 24,388,500 M cubic feet of gas and 323, 215 barrels of oil so that it has constituted a valuable addition to the local economy in the Moncton area. 'Of late years two explorations of importance have been made through arrangements with the holders of the lease to search for oil in the southern and southeast section of the province. I refer to the drilling carried out by Shell Exploration New Brunswick Limited between 1947 and 1950. These were largely unsuccessful and no development has resulted from them. Drill Wells. - 'In 1954, O.H. Parker, a famous oil operator from the United States, entered into an agreement with New Brunswick Oilfields Limited and applied his special methods to the problem. A number of wells were drilled and one old well reactivated in the course of this attempt to locate oil. 'This brief history of oil and gas exploration in the province is a preface to the announcement which I now wish to make concerning the new policy which has been worked out as a result of co-operation between New Brunswick Oilfields Limited, holders of the lease, and the government of the province. 'Possibly, at this point, it would be well for me to read into the record the outstanding points of Lease 115. They are as follows: Lease 115, N.B. Oilfields Limited. Petroleum and Natural Gas: Royalty, five per cent of wellmouth value. How acquired, license to search first granted, then crown lease. Term, 99 years (or to 2006) and renewable. Work requirement - 'The lessee during each and every year of the said demised term, shall be bound bona fide and to the satisfaction of the lieutenant-governor in council to continue to explore for oil and natural gas throughout the area in said lease demised, and to expend in boring for the same each year of the said demised term a sum not less than twenty thousand dollars, provided always, however, that if at any time the lessee makes it appear to the satisfaction of the lieutenant-governor in council that there is no reasonable prospect of discovering oil or natural gas by so boring, then and in such case the lieutenant-governor in council may on such terms as to the lessee releasing to the crown any portion of said area held under said lease, and the rights of the lessee therein, or otherwise as to the lieutenant-governor in council may seem right in the premises, relieve the lessee from the necessity of thereafter so expending in boring, as aforesaid, the whole or such portion of the said annual sum of twenty thousand dollars, as may seem to the lieutenant-governor in council just and reasonable. Lauds Attitude. - 'As you will note from these details, Lease 115 was to cover 99 years and be renewable. The lease would extend to 2006 A.D. and be renewable under these conditions. 'You will also note that it covered a large acreage and was very comprehensive - only a small part of the acreage has been explored of exploited to any extensive degree and under these conditions it would be difficult to believe that the full potential of our oil and gas resources was being realized. 'May I pay tribute to the management of New Brunswick Oilfields for their intelligent and generous approach to this problem, the difficulties of which they realized as much as the government. I would make it plain that the new policy which has been worked out has come about as a result of co-operation between New Brunswick Oilfields Limited and ourselves. Their management has always been able to meet us in a friendly and business- like way and, throughout, they have shown a conscientious appreciation for the public responsibilities faced by the government. 'Modification of Lease 115 should correct some of the disadvantages which formerly obtained and make possible a more vigorous exploration campaign, covering far wider areas of the province than heretofore. Cites Changes. - 'The important modifications are as follows: 1. The tenure of Lease 115 will be for 21 years from Jan. 1, 1958. The holder of the lease shall have the right to renew such portions of the lease that are capable in the opinion of the lieutenant-governor in council of being operated at a profit of not less than six per centum per annum. 2. The holder of the lease shall relinquish 1,000,000 acres of the leased area within 90 days of reaching an understanding with the government. The areas relinquished shall be according to a grid system determined by the government. 3. The holders of the lease shall relinquish an additional 2,000,000 of the leased area not later than two years from the date mentioned and again the relinquishment shall take place under a grid system determined by the government. 4. The area of Camp Gagetown shall be considered part of Lease 115 for the purposes of 2 and 3. 5. Royalty payable to the crown shall be one half that received by the holders of the lease but shall not in any case be less than five per cent of well mouth value. 'It is felt that these modifications of considerable importance and scope, will be productive of good results in encouraging exploration and development of our oil and gas resources. You will note that 3,000,000 acres - almost half the area involved in Lease 115, will be relinquished by the holder in the course of the next few years. This should create a new

Daily Sun - Feb. 12, 1902 Lecture of Attorney General Pugsley to the Electors of Kings. - ... Attention Is Now Being Directed To The Development Of The Mineral Resources Of The Province. - Under the vigorous and progressive Legislation which was enacted to stimulate the prospecting for oil, several wells have been discovered, and, from the information which I have obtained, I feel that I am in a position to say with utmost confidence, that it will not be many months before it will be demonstrated that the oil fields of New Brunswick are as extensive and as valuable as those in any part of the world. This is the opinion of the experts who have gone carefully into the matter. I am happy to be able to inform you that the geologists, under whose direction the oil wells in Westmorland and Albert have been bored, and in which oil in paying quantities has been got, have expresses a very positive opinion that the oil sands extend into Kings county, and I am informed that they have commenced the sinking of wells in different sections of the county during the coming season. It is impossible to over value the stimulating effect which these discoveries will have on the general business of the Province. This development is taking place without costing the country anything while the government has retained the right to collect a royalty upon the oil produced, which will afford a revenue of very many thousands of dollars in the near future. Recognising that we had in the Counties of Queensand Sunbury vast deposits of coal, which only needed a railway and the adoption of modern methods to produce a large output, we gave assistance to the building of a railway to lead from Chipman, in the county of Queens, to Fredericton. When this road is completed, the whole railway from Norton to Fredericton will be operated as one system. Arrangements are being made, with the approval of the government, for the establishment of a mining plant, which will be capable of mining and loading on the cars at least a thousand tons of coal per day. This will mean the employment of a large number of men and the development of an extensive business, while at the same time, it will give to the people of the Province a very much cheaper coal for manufacturing and domestic purposes

than they have been able to obtain in the past. The development of this great industry will mean very much to the people of Norton, Springfield and other portions of this county. It will mean the putting of the Central Railway in first-class condition, and the making of the through line from Norton to Fredericton one of the best railroads in the Province. In this matter of assisting in developing the coal areas of the Province, the government has not moved without due caution. It has been careful to satisfy itself of the vast deposits of coal existing in the counties of Queens and Sunbury; it has assured itself by careful tests, which have been made on locomotives of the Intercolonial railway, and by manufacturers, of the excellence of the coal for steaming purposes. The government has also taken steps to ascertain the likelihood of a market for the coal, and, with the quantity which will be taken by the Intercolonial and Canadian Pacific Railways, and by manufacturers in St. John and elsewhere, a profitable market is assured. These coal deposits are the property of the Crown, much of the coal being upon granted lands. We have been careful to thoroughly safeguard the interests of the Province and have provided by legislation that on all coal hauled by the railway a royalty of ten cents per ton on that mined upon granted lands, and of fifteen cents on that mined upon ungranted lands, shall be paid into the Provincial Exchequer. The present Mining Act has been criticised in"

Codes: E4 / IDX_Names: Alma Coal;
Morning Freeman - Dec. 13, 1859 A small box of clay and coal has been sent to our office by parties who state that they have found a vein of coal in the parish of Alma, Albert County, on the coast, 250 feet above water. At first it was but an inch thick, but they followed it for three quarters of a mile, and it gradually grew to nine inches in thickness. They describe it as following the shore for 100 rods, and then running directly inland, and say they expect to find a large coal bed. - The coal seems to be of the same quality as that from the Victoria Mines."

Chignecto Post - Aug. 24, 1882 Negotiations are proceeding to develop the coal found on the Durling Estate, Alma, A.C."

S.J. Daily Sun - Oct. 7, 1891 Harvey. - Henry Calhoun is prospecting for coal at Alma on the line of the A.S. Railway. The indications must be good to induce Mr. Calhoun to invest in the venture, for he is a cautious capitalist. It is saidtraces of gold bearing formation have been discovered also along this railway."

S.J. Daily Sun - Dec. 2, 1893 Albert Co. - It is believed that a valuable deposit of coal has been struck a few miles from Alma along the line of the Albert Southern railroad. A shaft has been sunk and the specimens are believed to be A1. Bliss Steeves is the chief promoter of the scheme."

St. Croix Courier - Dec. 7, 1893 It is believed that a valuable deposit of coal has been struck a few miles from Alma along the line of the Albert Southern railroad. A shaft has been sunk and the specimens are said to be A1."

Moncton Daily Times - Nov. 10, 1893 Albert Co. - The prospects of finding a valuable coal seam at Alma is causing a ripple of excitement. A shaft of about 100 feet has been sunk near the railway station and a bright shale of superior quality is being brought out. The present indications are regarded as very favorable. - Maple Leaf."

Codes: E4 / IDX_Names: Alma Coal;
Moncton Daily Times - Nov. 25, 1893 Alma Coal Mine. - A gentleman from the lower end of Albert county, who was in town yesterday informed a Times representative that there is a good prospect of a valuable discovery of coal being made at Alma by Messrs. Blair Duffy and Manning Duffy. Work has been going on the last two or three months and a depth of about 120 feet has been reached. A small vein was recently struck and the coal was of good quality. A donkey engine has been added to the machinery and the prospects of a profitable lead being discovered are said to be good."

S.J. Daily Sun - Oct. 10, 1893 Coal in Albert Co. - Manning Duffy and Bliss Steeves and Mr. Robinson (of Hillsboro) commenced this season to form a coal mine at Alma. This mine was discovered thirty years ago, but never worked. They sunk a shaft about 80 feet and the indications are good. Operations have been suspended for this season, but will resume next spring.- [Times"

Moncton Transcript - Jul. 4, 1894 Coal Mines At Alma. - A coal mine is being worked one mile this side of Alma, A. Co., in the hills. It was discovered about 40 years ago; and was leased for 99 years to one Vernon. When then new mining law came into effect several persons among whom were Manning Duffy, John Beatty, of Hillsboro, Mr. Downing of Alma and others secured the license for prospecting and are now developing the property. They have sunk a shaft already 130 feet through the shale and the quality of shale and coal is improving. The coal very much resembles albertite. A day crew has been working for several weeks and the indications are so good a night crew is now being put on. The same seam of coal runs through the hills and appears in the bluff about two miles down the bay shore."

Kings County Record - Aug. 30, 1918 Big Find of Coal by Sussex Man. - Albert Tribe Discovers Two Good Seams of Coal Near Alma, A.C., and Valuable Deposits of Shale. - Some time in May last Mr. Albert Tribe, contractor, of Sussex, went to Alma, A.C., to build a bungalow for Mr. Garfield White of C.T. White & Sons, Ltd. Having had some experience in mining he thought that the geological formation was such that there should be indications of coal in that vicinity. He spent his evenings and leisure hours examining the rock formation along the beach as far as Owl's Head. He soon found at Owl's Head the indications of coal. He at once took out a prospectors license and began to work a few days ago. He has been rewarded by finding two seams of coal one of which is over a foot thick and surrounded by a large body of shale. He has tunneled in at high water mark about ten feet and the seams of coal get thicker and by appearances will unite further in. The seam that he is working on extends above to the surface a distance of over 100 hundred feet. Mr. Tribe is certain from the kind of rock and the geological formation there is a large quantity of coal in the vicinity. He has sent specimens of the coal and shale to Ottawa for analysis. Every indication points to the fact of Mr. Tribe's find being a very valuable one and he is certainly open to congratulation on the success of his efforts."

Kings County Record - Sep. 20, 1918 H.M. Bayley of Fredericton, an expert on minerals was in Alma last week examining the indications for coal at Owl's Head, recently discovered by Albert Tribe of Sussex. Mr. Bayley reported that the coal was of a good quality and rich in coke. Owing to the disturbed state of the rocks he could not tell about the quantity but further development will reveal that fact."

Kings County Record - Sep. 20, 1918 Alma. - Principal Miss Colpitts and a number ofher pupils spent part of Saturday on the beach studying the Geological formation. They went as far as Owl's Head and were accompanied by Mr. Tribe, who is prospecting for coal there."

Kings County Record - Nov. 7, 1919 Prof. Graham, of Halifax, N.S., an expert on mines and minerals, was in Alma, A.C., last week looking over the coal property there that is being developed by Albert Tribe. He will make his report in about ten

Kings County Record - Jun. 24, 1921 Alma, June 20. - Albert Tribe of Sussex had a mining expert from Minto here last week examining his coal mine near Owl's Head."

Kings County Record - Mar. 11, 1921 Alma, Mar. 7. - Mr. Tribe has suspended work athis coal mine until the weather becomes drier. He returns to Sussex today. In the meantime he will visit the coal mines at Springhill and Joggins, Nova Scotia. (NOTE: Alma column not checked for several months prior to this article)."

Jan. 1922 - Copied from: Kings County Record - Jan. 22, 1942 20 Years Ago (27th). - The Alma Coal Company, recently incorporated by residents of Sussex, has, from all appearances, every prospect for a bright future. Experts have examined the property and have pronounced it a good find."

Codes: E4 / IDX_Names: Alma Coal;
Kings County Record - May 12, 1922 Will Soon Start Work at Alma Coal mine. - Practical Miner of Wide Experience in England and Cape Breton, N.S., Says There is Abundance of Coal There and Predicts the Striking of a 15 Foot Seam. - The Alma Coal Company, which was incorporated a few months ago, with head office at Sussex, N.B., intend to begin work on their holdings in Alma, Albert Co., in a very short time. Word has been received from Fredericton, that the Government Diamond Drill can be had at any time, as it is not now engaged anywhere. The Company are now selling stock and just as soon as there is money enough on hand to carry on the work, the drill will be procured and drilling for coal will begin. A thorough test will be made to find out how far down the seam is and the thickness of same. A practical miner was engaged last fall, and after working a few days he said there was abundance of coal there. This miner has had considerable experience in mining, having worked in a number of mines in England and also in Sydney, Cape Breton, and he said that of all the mines he ever worked in, there was none of them made a better showing on the surface than this one, and it would not surprise him if a five foot seam of coal were found there. This is the opinion of a coal miner who should know what he is talking about, and he had no reason for saying anything different to what he thought. Across Chignecto Bay and almost opposite Alma is the Joggins Mines, and as the Joggins mines are now operating 1 3/4 miles under the water, there is good reason to believe that the same seam of coal extends under the Bay to the N.B. shore. Coal has been found in a number of places between Herring Cove and West River, a distance of seven or eight miles, and where there are so many outcroppings, there must surely be a body of it somewhere near. A good coal mine in Alma should be a paying proposition on account of the good facilities for transportation by water to St. John, Moncton and other places. The great drawback at the present time is want of capital to carry on the work. It is difficult to sell stock on account of the scarcity of money. Many there are who would willingly invest, but are unable to do so at the present time. Quite a number have taken shares showing their willingness to help along the work, one lady having saved up her egg money until she had the price of two share (twenty dollars), which she gave of her own free will. If every one who could buy some stock would only show the same spirit, there would not be much trouble in raising money enough to open up the coal mine. There are, strange to say, those who are always ready to take stock in something that is being offered in some far off country, but ask them to take the same chance at home, in their own country and they are not willing to do so. It is the desire of the company to have the mine opened up as soon as possible, but it cannot be done without money, and it is to be hope there may be many who will help along the work by buying the stock that is offered and by doing so they not only stand a chance of making some money for themselves, but they are helping to give work to unemployed."
Kings County Record - Nov. 2, 1923 J.A. Tribe, J.B. Roach, H. Holeman, R. Johnson, C.S. Prescott, H. Evans, E. Robinson and Chas. Carr, of Sussex, were here on the 10th inst. Some of them were interested in the development of the

Alma coal mine, others in mercantile pursuits, and others on pleasure bent."

Kings County Record - Oct. 13, 1923 Alma, Oct. 9. - Albert E. Tribe, President of the Alma Coal Mine Co., brought here last week Joseph Stevenson, an expert miner and showed him the coal indications. Mr. Stevenson has decided to prospect on the hill near Murray Jordans."

Kings County Record - Sep. 14, 1923 Alma, Sep. 10. - J.E. Tribe of Sussex, was herein the interest of Alma Coal Mine."

Codes: E4 / J8 / IDX_Names: Alma Coal; Albert Mines;
Moncton Daily Times - Mar. 5, 1892 Mining Notes. - The Albert Copper Mining Venture: The Albert Coal Seam to be Reopened. - The New Brunswick Mineral Development Company has met with good success in the work of organizing the Alma Copper Company, which is to open up the fissure vein of copper bearing quartz in Alma, Albert Co., N.B. The last five thousand shares of stock has all been subscribed, thus furnishing the funds needed for beginning the work of opening up to ascertain the value of the veins. Captain O.B. Brown, an expert in silver and copper mining who has expressed the opinionthat the vein to be opened up does carry a large body of ore, was to meet Mr. James Robertson, formerly underground manager at the Albert mines at Alma, today and with a number of men they were to commence operations upon the big fissure vein. The first work, of course, will be to determine the course and dip of the vein, and then to choose a site for the sinking of a shaft. The work will be pushed forward as fast as possible. The Mineral Developing Company has also secured possession of the Albert coal areas and propose to proceed soon with the work of opening them up in places to determine whether or not there is a sufficient body of coal there to make the mining of it profitable. A company made an attempt some years ago, to open up this coal vein on the Barrett property near Edgett's Landing, but owing to lack of funds or some other cause, they did not continue their operations long enough to determine whether there was a good solid body of coal there worth mining. They left off in a fissure five to six feet wide showing 18 to 20 inches of Albertite coal with gravel on either side of it. It is believed that deeper down there may be a good solid vein."

Codes: E5 / A2 / E2 / IDX_Names: Sussex/ Plumwesweep Salt; Albert / Kings County Oil Shales;
Oil and Gas - Kings Co.;
Daily Telegraph - Jul. 6, 1865 Smith Creek, &c. - Last week I was kindly taken for a drive about twenty five miles up Smith Creek. Here is a portion of country, certainly among the most beautiful in the province. The rich alluvial soil along the valley of the stream, and on either side, nearly as far as the eye can reach, has every appearance of careful cultivation, and if one is to judge from the appearance of the farm houses and outbuildings, the happy possessors of the land are reaping their reward. The crops thus far are coming on rapidly and the grass has not looked so well in many years. American companies have several agents travelling throughout the county prospecting for oil and coal. They have met with success in several places. On the road between Petitcodiac Station and Butternut Ridge a party has already commenced boring for oil. The prospect of success is considered good. I saw samples of lead ore, and shale containing oil found in the neighborhood of Sussex. The discoverer, who is a practical man, is of the opinion that there is every probability of coal resembling that of the Albert Mines being yet found in this vicinity. The farmers are beginning to stir themselves about mining matters, and heaps of rock and ugly boulders which were heretofore looked upon as defacing to the fair appearance and injurious to the value of the estate, are most industriously examined and frequently glimpses of mica and other shining substances raise their expectation to a high degree and excite the imagination with pictures of untold wealth. Salt Springs. - I visited, in company of a friend, the celebrated Salt Springs situated on the main road between three and four miles from the station. The buildings in which the manufacture is carried on are in a most dilapidated state. They exhibit a great want of enterprise, pride and care. It is now forty-five or fifty years since these Springs were discovered and their waters turned to account. At that time the enterprising gentleman who took the matter in hand expended a large sum of money in the undertaking, and for several years a most flourishing and paying business was done. Owing to difficulties with the proprietors of the Estate, so I am informed, he was obliged to shut down and since that time the business of manufacturing salt at the springs has been becoming ""smaller by degrees and lamentably less"". Now one man attends to the manufacture, making per day on an average five bushels of salt. This is not sufficient to supply even the demands of the neighborhood, and when it is taken into consideration that this salt is much preferred for butter making and other purposes to the article imported, it is surely a matter of surprise that some person of wealth and ability does not take the manufacture in hand. Any quantity of salt I am told might be manufactured, and there is very little doubt that the speculation would prove a profitable one. Rusticus"

Codes: E5 / D4 / J8 / IDX_Names: Sussex/ Plumwesweep Salt; Elgin Albertite; Albert Mines;
Daily Telegraph - Sep. 15, 1885 Our Mineral Resources. - The mining and metallurgical engineers who pass through our city today, en route to Halifax, will have no time on their outward trip to make themselves acquainted with the mineral resources of our province. We trust that a number of them may take some time to that and before their return. There is reason to believe that our province, in some of its sections at least, is quite rich in mineral wealth. One of the best paying mines in America years ago was the Albertite of Hillsboro, and, though now exhausted in that particular spot, there are indications in both Albert and Westmorland that lead to the hope of further discoveries of this unique mineral. Favorable prospects of striking oil are thought to exist in Westmorland. There are wellknown salt deposits in Sussex and Upham, Kings county, the saline springs issuing from which have long been known. The coal measures of Queens county would

interest a mining engineer, and recent discoveries of gold, silver and copper in Albert county are beginning to attract attention. In our local columns a correspondent hasfurnished particulars of a mine just being opened in the vicinity of Elgin."

S.J. Standard - Aug. 8, 1912 Salt and Coal in King's County. - English and Montreal Capitalists Interested in New Ventures. - Sussex, N.B., Aug. 8. - Andrew Blair Aitken and party are here from England and are prospecting for salt beds at the scene of operation of the Plumwesweep Salt Company. Several concerns have failed to make the business go in the past, owing to methods employed, but the new owners propose to sink shafts in order to locate the salt beds. If these are found, pipes will be sunk and the salt washed off the beds, the same as is done at the big salt works in Ontario. By this method dense saturation brine can be procured and the cost of production greatly reduced. Plumwesweep salt ia a very high grade, and when produced has always commanded a ready sale at good prices. A boring outfit is already on the ground and work has been started. Another boring test is being made at Mount Middleton by Montreal capitalists who have become interested in coal formation there. Alexander Kent has his boring machine located in Mill Brook, midway between Mount Middleton and Berwick, and only bad weather has stopped active work. W.F. Mullins is the practical man on the job representing the company. He will be joined the first of the week by leading financial men from Montreal, when a final decision will be reached as to the extent of development work to be undertaken. Many encouraging indications of coal have already been found by those on the ground, and a profitable business is hoped for."

Codes: E5 / E2 / IDX_Names: Sussex/ Plumwesweep Salt; Oil and Gas - Kings Co.;
Kings County Record - Oct. 31, 1912 The boring for gas goes merrily on. The drill is now down 1200 feet and is going through dry sand. As stated last week at 1100 feet salt water was struck of the very saltiest kind, but since that nothing of the unusual has been run against. Another blast of nitro- glycerine and dynamite was set off at the bottom of the hole, to let the pipe go down straight, with a successful result. Instructions have been received to go down 2000 feet."

Codes: E5 / HILL / Z2 / J8 / E2 / GEOL / IDX_Names: Sussex/ Plumwesweep Salt; Grey Brook Gypsum; Sandstone, Building Stone, Monument Stone, etc.; Albert Mines; Oil and Gas - Kings Co.; Geology - General;
Morning News - Nov. 21, 1855 Geology of New Brunswick, &c. - At a recent meeting of the Boston Society of Natural History, held in this city, some interesting reports were submitted, a portion of which related to the Geology of this and the adjoining Province of Nova Scotia. Those who have an interest in the development of the mineral resources of the Provinces, will be gratified to see that we have within our borders a field for investigation, and whichit seems has attracted attention. From the Boston Traveller, which contains an account of the meeting referred to, we learn that a variety of mineral specimens were laid before the society, as the products of this Province. Among these were two very pretty fossil star fishes, which were presented by Robert Foulis, Esq., of this City, a corresponding member of the society. They were obtained from the postpliocene marls near the gas works, and in return the unanimous thanks of the Society were voted to Mr. Foulis for this and several other donations. During the past summer, Dr. C.T. Jackson was employed by C.D. Archibald, Esq., of London, to make Geological explorations in those provinces. In company with John L. Hayes, Esq., of Washington, the Doctor 8 commenced his search at St. John, and traced rock formations hence along the road leading to Petitcodiac. At the meeting referred to, Dr. Jackson gave a brief sketch of the Geology of New Brunswick and Nova Scotia, and described some of the species of rocks found in these Provinces. We condense his remarks. In St. John, he says, ""we found slates and metamorphic limestones, which, from the occurrence of them of a bed of hard sandstone containing a fossil tree, are regarded as belonging to the Devonian group. No molluscs, or indeed any fossils, are found in the limestone, which is made up of a mixture of the blue and grey varieties, highly metamorphosed by heat, and much disturbed in their stratification. Masses of Sienite, consisting of flesh-colored feldspar and hornblende, without much quartz, are observed at Indian Town, and are rocks of igneous origin. All along the Kennebecasis river, are observed red sandstones of the old red or Devonian group, and atSussex Vale we come to the celebrated salt springs, which rise from the saliferous sandstones, and produce by evaporation the finest and most agreeable table salt. In Hillsboro' we find the lower members of thecoal series, so remarkable for the abundance of fossil fishes of the genus Paleoniscus, and for that highly bituminous quality of coal which has been called Albertite. Hills of snow white gypsum, and some extensivebeds of Anhydrite, occur in Hillsboro', and in otherparts of Albert county. Naptha Springs also exist near the shores of the Petitcodiac river, and Petroleum floats on the surface of the waters that arise from them, and is deposited as a soft bitumen among the grass roots, and in the soil, it being left in its thickened and oxidized state by the water, as it periodically rises and falls with the seasons. On reaching the mouth of Chepody Bay we come to Mary's Point, and

Grindstone Island, where beautiful buff-colored, and light red sandstones, of the Carboniferous Group, are quarried for building stones, and a blue variety of the same formation which is used for making grindstones is found. The Mary's Point quarries present a scene of activity, owing to the enterprise of Mr. Archibald, who has employed upwards of seventy-five quarrymen, under the directions of Mr. George Lang, in quarrying out the freestone for architectural uses. - Those sandstones are found to be of excellent quality for building purposes, and are now being largely imported into the United States under the Aegis of the reciprocity Treaty between the United States and Great Britain. Mr. Alger has demonstrated the durable nature of this sandstone, before this society, and our observations authorise us in confirming his opinion, that it withstands the action of the frost even in the climate of St. John. The largest amount of the stone is of a yellowish 9 tint, or buff-colored, but there are also beds of lightred, and grey-colored varieties. They belong to the true coal bearing strata, as is proved by the fossil plants clearly impacted between the beds of stone, and thin seams of bituminous coal, occasionally discovered in them. An outline of rock called the ""Squaw's Cap"" presents us with an abundance of fossil trees, and roots, with smooth and striated surfaces. Occasionally we find siliceous nodules in the blue sandstone, which are called ""bulls-eyes"". They injure the grindstones when they occur, and stones containing them are avoided. Grindstone Island is one mile long, and half a mile broad, and is estimated to contain about 140 acres of quarry stone. The average height of the island above highest tides is 60 feet. In obtaining slabs of the blue sandstone for making grindstones, the tides perform valuable services, for the quarryman has only to split out the rock at low water, and fasten it by chains to his flat boat and allow the rising tide to float it, so that he can transport the stone to high water mark, and leave it where he can work upon it at his leisure. The best grindstones are obtained from the strata which are submerged at every tide. The strata all dip down under the Bay of Fundy, at an angle of 38 degrees to the southward, and the trend of the strata is nearly east and west. The extensive quarries are supplied with heavy and massive cranes and a railway, for the removal of the stones to the wharf, where they are put on shipboard. On examining the ""posts"" of the quarry, we found that stones of from one foot to eight feet in thickness, and of any length and width, could be obtained, and that a supply of coloured stones could be procured in abundance. Most of the stones sent from Mary's Point are sold in New York, Philadelphia and Baltimore, no agency having yet been established in Boston. The exploring party next travelled around the head of Cumberland Bay, and reached the Cobequid Mountains, they found rocks of igneous origin, and colored slate, which lay under the grey sandstones of the coal formation. Mr. Dawson describes these slates as belonging to the Devonian order; contiguous to them are extensive deposits of ocherous oxide of iron, with different species of iron ore, and manganese carbonate of lime, known under the name of ""amberite"". Mr. Dawson has given as his opinion that the immense deposits of yellow oxide of iron have resulted from the decomposition of the carbonate of iron in the antherite. These are the Acadian Iron Mines of Londonderry, N.S. It is supposed that a subaqueous eruption has produced the pulverulent peroxide abounding in these mines. There are small veins, bunches and films of black oxide of manganese in these ores of 10 iron, and this renders them more particularly valuable in the production of steel, since it has been discovered that this ore contains 52 38-100 per cent of pure metallic iron, and if the manganese is all reduced and alloyed with the iron, it will amount to 1 53-100 of manganeseism, the proportion which will make the iron into the finest kind of steel. There is just one blast furnace now in operation at the Acadian mines, smelting these ores, and six Catelan forges are also employed. The iron produced is remarkable for toughness and strength - and is sold exclusively to steel makers in Sheffield, Eng. Since the immediate country around is hardwood forest land, an abundance of charcoal fuel can be obtained, and there will soon be other furnaces built near the mines. Having completed the survey of the numerous mines near the Acadian furnaces, the Doctor and his associates next proceeded to Windsor, thence to the Valley of the Annapolis to Nictaux, where they examined the inexhaustible beds of iron ore which are worked by Mr. Archibald, and have been named the Victoria Mines. Geological examinations of these ore beds were first made in the year 1827 by Mr. Francis Alger and Dr. Jackson. These beds are remarkable for having a great profusion of fossil shells, seeming to indicate that these ancient molluscs had a preference for an iron bed rather than one of clay. - The Report indicates that there are Orthocera and several others, as yet unknown or undescribed molluscs, in these ores, and it is difficult to determine their species. They all appear to belong to the Niagara and Clinton Groups of the New York system. One of the most curious phenomena presented at these mines is the magnetic state of some of the ores, while others not far removed are wholly devoid of magnetism. A great number of mines have been opened lately on these ores, and some new beds have been discovered since the original survey was made. There are two beds, which vary in thickness from 6 to 10 feet, and they have been traced 5 miles in length, and probably extend to Bear River. There are several distinct beds beneath the main ones - very compact and magnetic, others are softer and not magnetic ore. The last variety is seen in the red slates of Little River, and the others near Nictau River. It was found impossible to rely on the compass needle in surveying the magnetic ore beds, for the needle was static over them, and was attracted even when quite remote from the ore - the North point invariably pointing towards the iron ore. These mines may be considered to be inexhaustible, and the wood of the country around, though it may supply fuel for many years, is not adequate to smelt more than a small proportion of the ore in view. Hence it is advisable to export much of the ore to the United States, as well as to make charcoal iron for steel on the spot, for exportation to England. 11 This is being done under the new laws of reciprocity in trade with the British Colonies, which will allow of the exportation of Anthracite to Nova Scotia, free of duty; but the iron made in Nova Scotia cannot be brought to the United States without paying duties, and hence it will be sent to England. Anthracite will smelt the Nictau ores with great ease and iron made will be good but not so valuable as charcoal iron. The result of smelting of the ores proves that either white forge or grey foundry pig iron can be made equal in toughness to that from Russia and Sweden. It also makes fine cast steel, as has been proved by trials made of it in Sheffield, Eng. John L. Hayes, Esq., confirmed Dr. Jackson's statement with regard to Nova Scotia iron. He remarked also that iron, manufactured by means of charcoal, was the only iron used in the chain cables of the U.S. Navy. He thought the value of the charcoal iron over anthracite iron was

Codes: E5 / Y1 / O7 / E2 / IDX_Names: Sussex/ Plumwesweep Salt; Salt Springs Salt; Salt/Potash - Sussex Area; Oil and Gas - Kings Co.;
Daily Telegraph - Dec. 13, 1890 Salt in New Brunswick. - Boring For It -Indications That it Lies in Accessible Situations. - Edward Jack. - There are strong probabilities that wehave in this province large deposits of salt, in situations very accessible to railway transportation. The indications which point to the existence of such are the various salt springs in Kings County and the occurrence of the salt spring or brook at Plaster Rock, on the route of the Tobique Valley railway. This latter seems to point to the possible existence of other salts than common rock salt. The occurrence of rock salt has been noted in almost every geological formation, with the exception perhaps of the very oldest. It is generally associated to a greater or less degree with sulphate of lime (plaster). In the instances to which reference is here made to the existence of salt springs in New Brunswick, the rock formation in which they occur is usually regarded as being in what geologists call the Lower Carboniferous. Taking into consideration the occurrence of thesesprings in such promising situations, and as instances without end can be cited where petroleum as well as inflammable gas has occurred in association with salt springs, it would seem as if it would be an advisable matter for the provincial government to give the subject of boring in New Brunswick for salt that consideration which the importance of the strong chance of its discovery in quantities here demands; and it would not be out of place, that a certain sum of money should under an existing act be risked on such a venture. As a preliminary it might not be out of place for the executive to consult Major Markham, of Sussex, on the probable cost which would attend such operation. Should an appropriation be made, it ought to be placed in the hands of the major or of some other equally reliable and practical man, who should be authorized to contract with experienced borers to do the work at certain rates per foot. It might be possible also that such borings, especially at Plaster Rock, would be the means of discovering some deposits of these salts of potash which have made Stassfurt so celebrated of late years, where so long ago as 1839 borings were made under the hope of finding salt, and brine was actually obtained in 1843, but it was so highly charged with magnesium compounds which is said to be the case with the salt spring at Plaster Rock, that it was considered not to be worth working. Certain geologists, however, who had made a study of the subject, felt sure that the magnesium had some other source than the bed of rock salt of whose existence they were convinced; this view was corroborated by the matter brought up by subsequent borings. In 1856 two shafts had been sunk to the depth of 1,100 feet each where a bed of rock salt was struck. Before reaching this they had passed through the overlying deposit of potash salts which had been indicated by the nature of the lime above mentioned. At this time their value was not suspected. Up to the year 1856 all of the salt produced in Germany has been the result of evaporation of saline waters. More than 40 years ago, however, the development of various industries in Prussia demanded a much larger supply of salt than could conveniently be had there and numerous borings, particularly in the localities where salt springs occurred, were made. At Stassfurt, they were begun in 1839 with the results mentioned above. The explorations of rock salt, began there in 1857, had already furnished considerable quantity of that material to the public before the utilization of its superimposed bed of potassium salts was thought of. It was Henry Rose who, in 1859, disclosed to the world all the importance of these various potash compounds, and as a result, in the year 1860 - 2,800 quintals of them were made use of in agriculture; in 1861 eight times as much, while in 1862 the quantity raised was 80 times greater, and since this period it has always been increasing. The present workings at Stassfurt have already made known the existence of a mass of carnalite corresponding nearly to six millions of tons of chloride of potassium supposed to be pure. In 1870 the annual extraction of potassium salts at Stassfurt had reached the quantity of 145,000 tons and for the city of Leopold ..?.. her neighbour, that

Codes: E7 / X1 / IDX_Names: Mineral Paint - General; Grand Lake Coal;
Daily Telegraph - Dec. 13, 1888 Mining in Queen's. - There is quite a boom in coal mining just now. Coal Creek on the Central railway is the centre of one of the mining enterprises. The American syndicate who have acquired extensive mining rights there have now a number of men engaged with steam power sinking a shaft, and will be shipping coal by rail at an early if the weather permits the finishing of the road to that point. The Messrs. King are engaged in erecting a blacksmith shop and boarding house for the works. They contemplate a quite extensive erection of buildings next spring. The same company is also conducting boring operations at Newcastle, and will erect buildings there. A telephone line is being erected to connect the manager's residence at Salmon River with the Coal Creek mines. Another association has been formed to push mining operations at Newcastle. Formerly the river steamers did not patronize Queen's county coal, but for some months past Messrs. Tapley Bros. have been using it in the tug boats and found it highly satisfactory. The result of this trial has induced them to invest in the coal business along with Messrs. Waring Bros., of Indiantown, and Mr. Samuel Green of Newcastle, who owns coal lands there. They have acquired other mining lands, and are now constructing a tramway for their mines to Flower's Cove, Grand Lake. They expect to supply coal for the tug service and also for the St. John market, and for general shipment and sale next year. A paint mine at Coal Creek is to be developed by Mr. Silas McMann, of St. John, associated with otherswhom he has interested in it. They have acquired mining rights."

Novascotian - Sep. 16, 1850 Resources of Nova Scotia. - The London Tablet furnishes the subjoined relative to Nova Scotia ... We have heard that a proposition was made by Dr. Gesner a few years ago, to the then leader of Lord Falkland's government to survey some portions of this province, containing large quantities of mineral resources which through some mistake, we suppose, do notfall under the surveillance of the Mining company. But for some reason or other

this suggestion was not complied with. The truth is this Mining Association possessing as it does almost unbounded wealth exercises a corresponding amount of influence and we very much fear that the evils of which the Tablet complains and which we are apparently destined to bear for many years to come, are beyond the reach of those most interested. But we must let the Tablet tell its own story in its own way:- ...... There are many most valuable mines in Nova Scotia and New Brunswick, of metals, coals, plaster, paints, &c., but all of these have long ago been given by George the Third to his hopeful son, the late Duke of York, of anti-Catholic memory. His Royal Highness got over head and ears in debt by gambling and profligacy, 15and made over all his interest in the mines of those regions to his creditors. His creditors are Englishmen, and they lay claim to everything in the shape of stone, or cement, or coals, or metals found beneath the surface of the earth. The consequence is, that iron monopoly binds and benumbs all the resources of this region, like the enchanted maidens which we used to read of in our boy-days, who were held captive in enchanted castles till the knight errand deliverer arrived. Now, lest people may say I talk at the English Government merely for talk's sake I supply two facts, which exhibit the true state of things here. Twenty-seven miles north of Fredericton, in Brunswick, resides a Mr. Marshall, who, some couple ofyears ago, bought and paid for a farm to the agent of the government. He began to cultivate it, and in the course of his labors discovered a coal mine. He opened it, and began to dig the coal, and found it good to burn; soon he began to sell coal, but the Government agent soon snuffed the cent; notice to desist was served on Mr. Marshall; the mine was soon sold to another, with a right, through Mr. Marshall's land, to enter to the mine forever; a forced trespass in perpetuity by order of the Queen.There is a lead mine in the neighborhood, also, amountain of stony substance, of which Spanish brown paint is made - but all these treasures are sealed by the Queen's authority, in behalf of the monopolists, created by former patents, or to be created by patents to come. ..."

Carleton Sentinel - Jun. 11, 1850 Report on the Agriculture Capabilities of New Brunswick (#5) by J.F.W. Johnston, F.R.S., &c. Kent. -1. A stratum of good coal is reported to have been discovered on the Cocagne River, about three miles above the bridge, by Dr. Gesner's son. ""The stratum was found 10 in the bottom of a large brook, and beneath three feet of rapid water. It was estimated to be two feet thick, but might nevertheless exceed three feet in some situations. By sinking a shaft a short distance from the brook,"" the Dr. adds, ""so as to avoid the influx of water, this coal may be opened immediately."" (IV. 86) 2. ""Coal has also been discovered on the Buctouche River, and there can be no doubt that it may be obtained in this district in great quantities."" (IV. 86) ""It is very evident that these coal strata are the most superficial, and therefore the least valuable in the series to which they belong; and from their small degree of inclination it may be justly inferred that the thickest and most extensive deposits are still concealed in the earth."" (l.c.) Although I have not had an opportunity of observing either of these last places, still, I may be excused for observing that although these coal strata are superficial, they are not necessarily the least valuable of the series; that is a point which cannot be proved until borings are actually made, or the outcrops themselves have been seen. 3. Coal was discovered nearly thirty years ago upon the Richibucto River, the best known locality is on the Coal Branch, about three miles above Mr. Ford's mills. I visited that locality in October last. The coal crops out about half way up the face or a high cliff on the west side of the brook, and is placed between layers of crumbling shale; the Coal cakes like the Grand Lake coal, and is about 15 inches thick; the dip is N.W. 10ø. One or two hundred chaldrons of this coal have been got out from time to time, by excavating under the cliff; but unless other beds are discovered, this place can never become the seat of extensive coal mining. Judging by the quality and thickness of the seam, it may yet prove to be the same as the one at the head of the Grand Lake, from which the sandstones pass continuously, but in an undulating manner towards the Gulf Shore. Dr. Gesner remarks (IV. 90) ""that it is probable that there is another stratum near the base of the cliff,"" though his labours to discover it were unsuccessful. Northumberland. -1. About five miles below Chatham there is every appearance of the existence of workable beds of coal; a small but perfect stratum appears on the cliff on the property of Mr. Willison: ""appearances,"" he adds, ""renders it almost certain that coal may be obtained here at no great depth from the surface."" (IV. 95) 2. About eleven miles from Newcastle on the southwest branch, coal appears on the south bank of the river. It is but an inconsiderable stratum belonging to one of the superficial beds already alluded to."" (IV 97) 3. Coal has been found on the Renous and Barthalomew's Rivers, but the water was too low to allow any canoes to pass at the time of my exploration in this quarter. (IV. 11 97) Gloucester. -Outcroppings of bituminous coal have been seen at New Bandon, and drift coal has been picked up near Bathurst Harbour in quantities sufficient to justify parties in boring in the neighborhood; various shafts have been sunk under the direction of Mr. Stephen, while an agent for the Gloucester Mining Company, and others; but in no case, so far as I am aware, have workable beds been attained. In Mr. Logan's elaborate section from Cranberry Cape to Point Dumai, a distance of twelve miles along the shore, only two seams were discovered, and these were respectively eight and six inches in thickness. They were both supported by an Under clay with stigmaria, and dipped with a very low angle to the N.E. Restigouche. -Coal has been spoken of on the Restigouche between Campbellton and Dalhousie. In 1839 I had an opportunity of examining that shore, and observed both at Point Anim and Point Pin Sec, a black coaly rock, which is said to have been used for fuel. It was a black shale, indurated and changed by the neighbouring igneous rocks.

By Mr. Logan's report, it appears that the sandstones which line the margin of that river do contain a small but regular seam of coal and carboniferous shale, together measuring three inches: ""it is not however to be inferred,"" says he, ""that the group belongs to what is emphatically called the carboniferous era, on that there is much probability of discovering the mineral associated insufficient quantity with its strata to render it profitable to mining enterprise; though seven thousand feet of vertical thickness in continuous succession have been carefully examined,"" nothing, he adds, ""like a working seam, nor anything like a regular seam, or like a seam at all, has been met with."" Saint John. - Dr. Gesner remarks (II. 12) that he discovered two small veins of anthracite coal in a fine grained clay-slate near the Penitentiary: "" and it is probable,"" he adds, ""that a workable quantity is not very far distant from that spot."" (II. 12). The occurrence of coal and vegetable fossils in the rocks of that vicinity is very curious, and requires further investigation; I have never had an opportunity of seeing the anthracite in situ. Charlotte. - I am unaware of coal ever having been reported in this county. It is much more likely to become the seat of mining for ores of the metals. Search for coal has recently been made among the dark coloured, slate near St. Stephen, but these are far below the true coal measures. Carleton. - Coal has not been spoken of from Carleton. If the gypsiferous rocks of the Tobique belong to the carboniferous series at all, they must underlie the productive coal measures. At the Red Rapids, the 12 western edge of the red rocks, is seen to rest unconformably on the slates, and near the head of the river they are met by igneous rocks: it is just possible the red rocks of this river have been in former times connected with the red rocks of the Bay de Chaleur from which they were first separated by the upheaval of the igneous rocks just spoken of, which constitute the highest land in New Brunswick. In conclusion, it is sufficiently obvious -1. That though very many outcrops of common coal, well adapted for blacksmith's use, are known to exist in the country, yet none of them exceed eighteen or twenty inches in thickness. 2. That though the beds of cannel coal reported to exist have a very considerable thickness, they hardly come up to the average standard of purity. 3. That the importance of the beds which are known has been over-stated, while the probability of finding others of greater thickness and improved quality, has been much exaggerated. Most respectively, Sir, Your obedient humble servant. (signed) J. Robb. Prof. Chem. & Nat. History, King's College. To Professor Johnston, &c. &c. The sum of the reasoning and information contained in this chapter appears to be- 1. That in reference to the agricultural resources of the Province, and its population sustaining capability, the supposed existence of fossil fuel is of great importance. 2. That without fossil fuel, manufactories can be established and maintained only at the expense of its agricultural and future population sustaining capabilities. 3. That Dr. Gesner, whose knowledge of the Province is very extensive, has predicted the discovery of valuable beds of coal, which shall prove of great benefit to the mercantile, manufacturing and agricultural interests of New Brunswick, but 4. That Dr. Robb and others, who have had opportunities of examining many parts of the country, do not participate in this opinion. 5. That the decision of the question would be of great moment to the Colony, not only in setting a disputed matter at rest, but in diffusing throughout the community distinct and positive notions as to the real resources of the country, and the line which ought to be taken to developing them - and in pointing out to the purely agricultural settler the mode of clearing he ought to adopt, with the view of securing himself and to the future occupants of the farm, if necessary, the benefits of an abundant and economically available supply of fuel, with as little loss of available land as necessary. I venture therefore to suggest to Your Excellency, as likely to promote all the material interests of the Colony, that means should be taken to secure a survey of the coal measures of the Province - with reference especially to their positive and economical value, as available sources of fossil fuel. This survey should be made by a person who is not only familiar with the principles of geology but with the practical economy of coal mining also - and if with a knowledge of England or of the United States, he possessed some familiarity, also with those of Prince Edward Island and Nova Scotia, the prospect of advantage to the Province from his labours would be greatly increased. That the advantage to the agricultural interests, in so far as it affects the rearing of timber, is concerned, would be general also, will appear from the numerous places in which coal has been detected. An inspection of the Geological Map in which these places are distinguished by large black dots, will also show how many parts of the province would be benefitted directly by the exploration. Let it be proved that coal exists in available quantities in these localities, and clearings may proceed without regard to future provisions of fuel. Let it be established on the other hand, that no reasonable expectation of fossil supplies can be entertained, and every proprietor will see the necessity of reserving ten acres of accessible wood land for his household fuel. The Legislature may even think it necessary to enact some compulsory statute upon the

Progress - Feb. 9, 1895 Notes of Provincial Industries. - ...The aiding of coal mining and coke making. New Brunswick has in its surface seams a billion tons of workable coal, much of which can be brought to the proposed docks by pipe line at a total cost of not exceeding $1 a ton, or by rail at $1.25 a ton. This coke can displace most of the anthracite now used in the maritime provinces, and much of that imported into the St. Lawrence valley. Therich oil shales of Kings and Albert counties, of great extent, can, by aid of the proposed company, be utilized, as is done in Scotland and elsewhere. The proposed company can insure the smelting of iron ores in this city, and out of this industry a dozen kindred ones would soon grow up; numerous ore deposits, some of them of the purest known, are available; some experts assert that St. John is the most favorable location, all things considered, in Canada, for large iron industries. And Mr. Peter Imrie, of Liverpool and the White Star line, says: Canada, from the abundance of her nickel deposits, must necessarily control the ship-building trade. Iron pyrites can be delivered in this city in any required quantities, at rates that will ensure its utilization here, and also large shipments abroad. The proposed company can readily establish this and some other industries with but little capital, in anticipation of the construction of the docks. From mussel rock, gypsum and limestone, to be hadnearly in exhaustless quantities, and also sulphuric acid"

The Busy East, Page 22 - April - May, 1925 The Hillsborough Plaster Company - (Material provided by Mr. James S. Blight) - The pioneer of the business was Captain James Blight, a Cornish miner. In Cornwall he took contracts in tin mines. The word Captain is a Cornish term for contractor. He was married in Cornwall to Catherine Seymour. He came out to Boston about 1850 and within a few years was sent by Fowler & Company to Hillsborough. In Hillsborough, Mr. Blight operated quarries for Fowler. While doing this he became interested in prospecting for Albertite coal. He found anoutcropping of Albertite in Lower Hillsboro and took up property on the prolongation of Albert Mines vein and prospected it with a diamond drill. For ten years or more he prospected and during that time formed several companies in Boston and New York to develop Albertite. He also located the Dominion Coal Mines in Pictou county, Nova Scotia and one in Cumberland County. The latter operated only periodically. In Hillsboro Albertite proved not to be in paying quantities and the companies which he had formed disbanded about 1880. Two or three years before his death Mr. Blight turned again to developing plaster quarries and sold the gypsum to Weatherspoon Brothers, New York. He shipped about 5,000 tons a year as low as 70› per ton. This was on land which he was already operating for coal. James Sr., died about 1880, leaving a family consisting of a son, James and a daughter Mary. James Jr. was born in 1856. He continued to develop the quarries operating them about seven years. The Albert Manufacturing Company purchased the land in 1890. Mr. Blight Jr. then travelled over Nova Scotia and Newfoundland looking for plaster in the interests of the J. B. King, Company, New York. He located quarries at windsor, Nova Scotia, which at present have an output of 300,000 tons a year. He developed and operated a quarry at Demoiselle Creek of white paster about 1890. This quarry has an output of 10,000 tons a year of the very best quality of plaster. A heavy overburden of clay from 40 to 60 feet deep is found over the vein of plaster which vein is 90 feet thick and covers an area of perhaps 50 acres, which is scarcely more than prospected as yet. It is mined by the room and pillar method, The greatest length of the tunnel is 1,000 feet, At the level where it is entered it is 30 feet from the top of the vein. The level has been operated for twenty years and now employs about twenty men. The plaster from this quarry has been used largely in the pottery trade in Ohio, U.S.A. It is operated by the King Company. The plaster is shipped by C.N.R. and loaded into ships at Gray's Island. The Hillsborough Plaster Quarry was taken over from N. C. and C. N. King Brothers who had been operating it for some years. It was run by the Hillsborough Plaster Company which was a company subsidiary to J. B. King Company (J. B. King was a nephew of N. C. and C. N. King). The plaster found in Hillsborough quarry makes strong walls but is not white. When James Blight was operating it, the output was from 15,000 to 20,000 tones a year. It employed about twenty-five men and worked only in the summer. During the first summer the plaster was hauled by terms to the Government Pier at Edgett's Landings, while the Company's wharf was being built. Next year the Company built an incline railway, the only one in the Maritime Provinces used in the gypsum trade. It was used for five years but was too slow and expensive. Now since 1920 the rock is crushed at the brow of the hill and transported over a conveyor to the storage bin in the ravine and loaded on cars. There is a tunnel under the bin and here it is drawn off into cars. The cars are hauled to the Company's wharf by a small engine. The 'sidedump' cars are used where the Albert Manufacturing Company uses 'end-dump' cars. The plaster is not touched by hand. It is blasted from the face, loaded by steam-shovels into the cars, dumped over a screen to clear the dirt away and thence into a crusher. The capacity of the crusher is 500 tons a day. In 1923 about 250 tons a day were turned out. In 1924 the J. B. King Company amalgamated with the United States Gypsum Company who will enlarge operations. The proposal is to increase the output from 40,000 tons to 100,000 tons per season. Improved machinery will remove the necessity of employing more help. Compressed air boring drills are used in place of hand augers. James S. Blight took charge in 1920, as manager. He has introduced the crusher and air drills. George and Barry Blight are superintends at the plants. James S. took an engineering course at Mount

Codes: GYP / J8 / IDX_Names: Gypsum; Albert Mines;

N.B. Reporter - Dec. 16, 1864 A friend in Hillsboro writes us as follows. Concerning the plaster and plaster trade of that locality:- ""The whole Parish of Hillsborough, I am told, has a population of 3,000, but the town has not more than 1200, I think. There are 10 or 12 shops, which retail a little of every thing, a Telegraph and Post Office, the Store of the Plaster Company and also a grinding mill of the same company. There are two tracks, which cross the main street, the one conveying plaster from the quarries to the Mill, the distance being about three miles, the other, the Albert Coal track, which runs from the mines to the river Petitcodiac, on which Hillsboro is situated, being a distance of between 5 and 6 miles. The Plaster Mills, as the overseer informs me, can grind up to 100 tons of plaster per day, though they do not grind more than sixty tons on average. The Company send most of their plaster to the States, but as at present the South is shut up they have lost a great market. The Quarries themselves are situated about two miles to the west of Hillsboro, in a region of rounded hills, where there is an inexhaustless supply of the plaster, of which there are four varieties. The first and best variety is the clear white soft kind, which may be ground easily so as to form Plaster; the second is a kind of impure whitish black ore, which is used for manure; the third is a soft pinkish kind, which could be used as a plaster but that it is apt to give the wall a streaked appearance if so used; and the fourth is of a somewhat crystalline kind resembling selenite, except that it occurs in pseudomorphs disseminated through the plaster and is sometimes of a delicate pink tint. During the winter the Company contracts with persons to get enough quarried to ship to the States in the Spring. - One ship load of the raw material has just left for Philadelphia. Ship building is also carried on to some extent, though not so extensively as in many other parts."

The Albert County Journal, Page 2 - Friday, July 31, 1903 ALONG THE LINE - Salisbury, thirteen miles form Moncton, the passenger takes the Salisbury and Harvey Railway, which runs to Albert, some forty-five miles. Leaving Salisbury, one passes by Turtle Creek and other rich farming and lumbering districts; then Hillsboro, the first place of importance, where one begins to see the beauties of the county, as the Petitcodiac river flows by the broad and fertile marsh meadows. The famous 'Cape Rocks' are near Hillsboro. The Rocks are admired by all who see them and are the greatest nature's work. The celebrated Albert Mines are near here, but they are now abandoned, and no other large deposit of the peculiar 'Albertite' has yet been found. The quarrying andmanufacturing of plaster is, however, being carried on and is the most important industry in New Brunswick. .. ... Albert County is an ideal land for the tourist and all should not fail to see the greatest piece of work on the American coast - the 'Rocks' at Hopewell Cape."

Codes: GYP / J8 / GEOL / IDX_Names: Gypsum; Albert Mines; Geology - General;
Morning Journal - Feb. 12, 1866 Rock Records of New Brunswick - A Lecture, by Professor L.W. Bailey, A.M. (continued) : The currents must have been of vast force and long continuence to build up such enormous beds. Fully 10,000 feet in vertical depth to solid rock must have been washed away, for even the old limestones and granites of Portland, the most ancient beds in the Province were laid bare and we may even find large masses of these rocks, sometimes 3 or 4 feet in diameter, worn or rounded by the power which removed them. But this power decreased as time moved on. As we rise to the higher beds of the period we find that these currents became much less violent, the land which had been rising rapidly now became more stationary, though still falling and rising at short intervals. Of its actual extent at this period we know little, but from the occurrence of these conglomerates skirting both sides of the high ridges, which stretch from St. John eastward to Shepody Mountain, it seems probably that these ridges constitutea long and narrow island, occupying much of the presentcounties of St. John and Albert. In Nova Scotia the Cobequid Mountains formed a similar island or chain of islands while to the north and parallel in general direction, lay another narrow strip of land, now comprising the peninsula of Kingston. Still another, of even greater length, stretched through the present counties of York, Northumberland and Gloucester from the boundary of Maine to the Bay Chaleur. This land was probably but scantily covered with vegetation, which had been largely destroyed by the Devonian revolution, but the intervening shallow channels still teemed with life. Shells and corals grew in abundance and their remains, crowded together like modern oyster beds, constitute thenumerous and valuable limestone beds of this formation. Fishes, too were plenty, for many of the strata are filled with their remains. They seem to have been especially abundant about the Albert Mines, and it is to them principally, that we are to look for the origin of that highly valued and curious substance, the Albert coal. That the latter was once a fluid oil or petroleum, very similar to that so abundant in other portions of America is now almost universally believed, both on chemical and geological grounds. That it is of Lower Carboniferous and not of Devonian age is also certain, for, as we have seen, the rocks of the latter had been baked by an intense heat long before the Albert shales began to be deposited, a heat so intense that all volatile and combustible matter, such as petroleum, must have been completely driven off. Nor is there anything in those Devonian rocks from which the bitumen could have come. We can only look to the shales themselves as the source of the Albertite, and no one who has seen those shales, crowded as they are with the remains of fishes, whose mere skeletons are now left to us, can doubt that it was largely from the decomposition of their soft bodies that the oily matter, now hardened by exposure, originally came. There is another substance abundant in the rocks of this formation, which, though less valuable than the Albertite, yet deserves a passing notice. I refer to the numerous bed of gypsum or plaster, not only extensively employed for moulding and casting, but so beneficial as a fertilizer to the soils with which they are naturally or intentionally mixed. The origin of this gypsum is somewhat uncertain but the supposition of Dr. Dawson, the distinguished geologist and author, is probably the true one, that they are the result of a chemical action caused by streams of sulphuric acid flowing from volcanoes beneath the sea, and coming into contact with previously formed beds of limestones, shells and corals. But I must not delay over theoretical and uncertain facts. That shells and corals, producing limestones, did actually exist in vast numbers in the seas which then covered nearly all the central portion of the Province is abundantly proved by their remains; that volcanoes also were still active as in earlier periods, is also evident from the effects which they every where produced. Indeed this period would seem to have been particularly remarkable for the number and intensity of its igneous outbursts. Around the entire central basin they seem to have formed a burning crown, and we may still mark the spots such as Hampstead, Inniskillen, Harvey and the Keswick, where the fiery ..?.. pored forth. These volcanic disturbances were probably accompanied by oscillations of level, as indicated by the shifting nature of the deposits then formed, but upon the whole the Province was rising, and gradually assuming its present level. The interior basins were becoming more and more shallow, the islands larger and more numerous. Island seas, by being shut off from communication with the ocean, were gradually converted into salt and then fresh-water lakes, and finally into marshes in which, favored by a warm tropical climate and abundant moisture, vegetation became luxuriant, while the land was again covered with a rich forest growth. This was the period of the true Coal formation. It was a period remarkable chiefly for the large extent of the continent then above the sea, as well as for the low and level character of that portion which had been so elevated. The disturbances which mark so grandly the close of the Devonian age in New Brunswick do not seem to have affected other portions of the continent to the same degree. Few elevated ridges existed anywhere. Even the Allegheny Mountains had not yet been raised for they include large beds of Coal, which at the time of their formation must have been near the sea level. Over the central basin of America, where through the earlier age was a vast coral-growing inland sea, there were now only wide expanses of low marshy land, with here and there an island, supporting, as in our modern tropics, dense forests and jungles. In these forests and jungles, where vegetation was so rank, only the lower forms of terrestrial life found sustenance. Not that the latter was scarce, for plants, the natural food of animals, were far more abundant even then than now, but the air was not suitable for their respiration. Carbonic acid, a gas incapable of supporting life was then present in quantities in the atmosphere. Insects, such as scorpions, locusts and beetles, with reptiles, constitute the life of the forest, while in the seas were fishes, allied to our modern sharks, as well as

shells and corals. But there were no quadrupeds nor birds upon the land nor whales in the ocean, for these are warm-blooded animals and require a purer air to sustain their life. It was the part of the great Co..?.. to effect this work of purification, to remove from the atmosphere the poisonous gas, and converting it into another form, to store it away in the earth for the future wants of the human race. How perfectly this work was done may be appreciated when we think of the enormous extent of the coal beds which represent the carbon then removed by vegetation from the air. The extent of the United States coal fields is 130,000 square miles, that of Nova Scotia and New Brunswick, 18,000. The thickest of the beds varies, of course, very greatly. One immense bed in Pennsylvania is 23 feet thick, and another in Pictou, N.S., 37 feet!. Now it has been calculated that at least eight feet of vegetable matter was required to make 1 foot of ordinary bituminous coal, or 12 for one of anthracite. It follows then that at least 300 feet of plant remains must have accumulated on that one spot alone, and for every six pounds of that coal of carbonic acid must have been taken from the atmosphere, rendering the latter purer by that precise amount. It is not of a curious thought that, as we sit by our fires today, we are as it were basking in the sunshine of the old Carboniferous forests, warming ourselves by the heat, and cheering ourselves by the light, stored up for our use in the earth's early days? The vegetation by which these enormous accumulations were formed was of a very different character from any now existing. There were no palms in the Carboniferous forests, no oaks nor maples nor willows, nothing indeed resembling our wooden hardwood trees. The plains were without grass, and the swamps and 13 woods without moss. The principal trees were related to the pne family, yet different from them in many important particulars. They were of large size, trunks fifty or sixty feet in length being not uncommon, and with them were associated tree ferns and rushes in vast numbers. In the great Joggins coal section in Nova Scotia there are 76 coal

Royal Gazette - Aug. 14, 1867 Cap. LVIII. An Act to ratify and confirm the incorporation of the East Albert Mining and Manufacturing Company. Passed 17th June 1867 Whereas pursuant to the terms and provisions of the Act of Assembly, intituled An Act relating to Corporations, James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, did on the second day of April in the year of our Lord one thousand eight hundred and sixty five, file in the office of the Provincial Secretary a Memorandum of Association for the incorporation of a Company to be styled ""The East Albert Mining and Manufacturing Company,"" for the purpose of mining coal, shale, asphalt, asphaltic rock, plaster or gypsum, and all other minerals whatsoever; and for raising, manufacturing and trading in oils and other illuminating and lubricating substances, and such other business as may be incident thereto, with a capital of three hundred thousand dollars, to be divided into three thousand shares of one hundred dollars each, and stating that the office or principal place of business will be established at Hillsborough, in the County of Albert; and whereas the Provincial Secretary did on the same day grant his certificate thereof in the terms required by the said Act, and did give notice in the Royal Gazette of the granting of such certificate, with the terms thereof; whereupon the said James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, became and were a body corporate and politic by the name and style of ""The East Albert Mining and Manufacturing Company,"" for the purpose in the said certificate certified, and for such purpose had all the powers made incident to a Corporation by Act of Assembly; and whereas fifteen per cent of the proposed capital stock was paid in for the purposes of the Company within two years from the publication of such notice in the Royal Gazette; but the certificate of such payment having been made, was not filed in the office of the Provincial Secretary within two years from the publication of such certificate, as required by the said Act of Assembly;- Be it therefore enacted by the Governor, Legislative Council, and Assembly. - That notwithstanding 6 such noncompliance with the terms and provisions of the said Act, the said James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, their successors and assigns, are declared to be, from and after the publication of such notice, a body corporate and politic by the name of ""The East Albert Mining and Manufacturing Company,"" with all the rights, powers and privileges incident to a Corporation by Act of Assembly; and all acts done and to be done and performed by them, and all properties, rights, powers and privileges acquired or to be acquired by them, are and shall be valid, held, used and effectually to all intents and purposes as if the said certificate had been duly filed in the office of the Provincial Secretary, pursuant to the provisions of the the said Act of Assembly."

Morning Telegraph - Sep. 9, 1865 The Town Of Petitcodiac. - ... The Petitcodiac Mining and Manufacturing Company have their headquarters here. They have spent a large amount of money in the purchase of land, erecting a building, securing limestone and plaster deposits, and improving the property. The land obtained by the company has proved to be an excellent investment, and the extent of the plaster and lime rock which they control is almost unlimited. Steam power is used in the mill; and arrangements are making to extend their operations and furnish a manufactured article equal in quality to any in use. The stock of the company has been freely taken, and it is hoped that the enterprise will result successfully. A large portion of the stock is held in St. John, although Petitcodiac, Salisbury, Moncton, and other places subscribed handsomely. The extent of plaster and lime rock available at and near Petitcodiac is something enormous - there are mountains of it. And in this connection it may be noticed that the North River flows only a stone's throw distant from the Railway station, and that the water power on this North River would turn all the plaster mills that could be crowded upon its banks. But the buried wealth of the country adjacent to the station consists not of plaster alone; there is good reason for

believing that petroleum exists within a few miles of it - salt springs are found at places not many miles distant, and in different directions, while traces of oil have been found on the surface. Large tracts of ""oil sands"" have already been secured by gentlemen who are supposed to know what they are doing... the lime and plaster deposits will yet be mines of wealth; and the probability of its becoming a great oil producing region will always make it a place of interest."

North Shore Leader - Dec. 27, 1907 Mineral Resources of New Brunswick. - Development of Coal, Iron, Oil and Other Mineral Areas. - The London Times of recent date published an engineering supplement containing an interesting article on the mineral resources of Canada, from which the following is taken, relating to New Brunswick. - Quebec's eastern neighbor, the much smaller province of New Brunswick, sandwiched between the Gaspe Peninsula and Nova Scotia, claims to possess a mineral- bearing territory, though it has not been regarded as a mineral province. If local testimony is to be accepted this is because, for some unknown reason, it has never received the attention from geologists and prospectors which its people believe to be its due. It is declared that the northern part of the Province remains practically as unexplored as the centre of Africa. Through this country runs the Cambrian formation, 150 miles long by 150 miles wide, and only the lumber interests are acquainted with it. But the Province's geological department is awakening to the possibility that the unprospected regions may yield discoveries which will give New Brunswick other characteristics than agriculture and lumbering. The province's actual yield of minerals generally cannot be counted of importance, whatever its potentialities may be. No paying deposits of gold or silver have been discovered, though this may be, as indicated, because the province has attracted few prospectors. Its coal measures in the counties of Queens, Sunbury and Kent, thus far only supply local markets. The seams are thin, not averaging more than 20 in. but they are believed to be capable of developing into much greater areas. That New Brunswick coal is not more largely mined is attributed to the proximity and wealth of the Nova Scotia coal fields, which has not been favorable to the growth of those of New Brunswick - to the extent to which they admit of such development. For the rest the Province's extensive deposits of gypsum, of a fine quality have for many years been profitably worked, iron though little developed, is present in large deposits, and is being explored near Bathurst to the"
Frank J. Horgan, P. Eng. Oct. 2000 49 Talwood Dr., Don Mills, Ont. M3B 2P4 fhorgan@home.com Frank Horgan Sr. had worked in construction most of his life, operating a 'steam shovel' or dragline, onprojects such as the Welland Canal (which led to my birth in St. Catharines, Ont.), the Navy Pier in West Saint John, strip gold mining in E. Malartic, P.Q., until the time, following the depression, and in the early World War II years, he was prospecting and found a coal seam near Coal Creek, N.B., on the outskirts of Chipman, N.B. He negotiated the purchase of a Bucyrus-Erie 50B steam shovel, on which he had worked for Brodrick Bros. Contractors, and brought it to the site to conduct open surface mining of the coal, sold by his agent Max McCarty to Canadian Gypsum Co. in Hillsborough, N.B. This workcarried on during the early 1940's, until the coal seam became too deep to allow profitable continuation. He boarded at the time at the residence of Earl W. Hine in Chipman, who ran a Ford dealership on the ground floor. One of his chief workmen was Harold Boyd, part of a crew of some 16. I don't have much more to tell you, but royalty payments had to be made to the Government at the time, and

S.J. Daily Sun - May 16, 1893 and Moncton Daily Times - May 17, 1893 Albert County. - Result of the Mining Court Session at Hopewell Hill. - Hopewell Hill, May 15. - On Thursday last the surveyor general, accompanied by Mr. Loggie and stenographer, arrived at Hillsboro to hear and determine upon certain applications under the Mining Act. There were protests filed in two cases, one by Charles Archibald against Frederick Steeves and others, which related to the territory embracing the celebrated Baltimore shales. Messrs. Steeves and W.F. Wortman were present, and C.A. Peck, Q.C., of this place, appeared for Archibald. A compromise arrangement was entered into by which the interests of the different parties became amalgamated, to the satisfaction of all concerned. In the other case, that on the petition of Barnett and others, for renewal of license held by J. DeWolfe Spurr, and in which Fen. Fraser had filed a protest, C.A. Peck also appeared for Barnett and others. C.J. Osman appeared, claiming exemption of certain lands held by the Albert Manufacturing Company. He also filed a protest on behalf of the Messrs. King, of New York, as to a portion of the territory. Mr. Peck assented to the exemption of the Albert Manufacturing Company's lands (only about 25 acres), but resisted the other protests on grounds held good by the surveyor general. It was ordered that a lease of renewal of rights be issued to Messrs. Barnett et al. This is said to cover the famous Albertite area."

Codes: HILL / J8 / IDX_Names: Grey Brook Gypsum; Albert Mines;
S.J. Morning Journal - Apr. 26, 1867 Albert Co. - ... As regards mining matters in Albert there seems to be little change. No large veins of Albertite, beside that at the Albert Mine, have been as yet discovered, though the East Albert and Princess Alexandra Companies have been spending large sums of money in the research. The East Albert vein presents a very interesting study to the Geologist. It was discovered on the summit of the hill in Lower Hillsborough in the thin layer of limestone, capping the conglomerate; it was about six inches in thickness, and dipped at an angle of 80ø. A shaft was sunk to the depth of fifty feet, and a drift ran to the vein which was in a cavity in the conglomerate, filled with soap stone and pebbles. The miners passed through this and struck the opposite wall without noticing the vein. On working back, however, it was discovered in appearance like a line drawn by a black lead pencil, but, on following it for a few feet, it became a pocket of Albertite fifteen inches in thickness. A quantity of the material in this vein is elastic, and will bend almost like India rubber. I am informed that a shaft has been sunk upwards of two hundred feet in another place, and this vein drifted to but that no increase in the size has occurred.Plaster, Etc. Operations in plaster are being carried on but to a limited extent. A new quarry has been opened up at Hillsborough, from which some cargoes will shortly be shipped. Plaster is very abundant in Albert, but it is unfortunately at some distance from the sea. There is one cliff of it on the Demoiselle Creek which is 130 feet perpendicular in height, forming in summer a very picturesque object. The pure white of the Gypsum contrasting pleasingly with the dark green foliage crowning its summit. Here may be seen a very clearly defined and extensive synclinal or inverted curve, which shows for a distance of some hundred feet exhibiting well the structure of the rock. It is sometimes dangerous to walk through the woods which cover the plaster formation when snow is on the ground as frequent indentations in the surface are met with. Many of these are so deep that Moose and other animals have, on former times, lost their lives by falling into them, a fact that is proved by their bones now lying in the bottoms of these holes. In my next letter I will be able to give the many readers of the Morning Journal some account of the present state of the operations in Manganese, as well as of the veins of copper in this county."

Codes: HILL / J8 / IDX_Names: Grey Brook Gypsum; Albert Mines;

Morning Journal - Jul. 12, 1867 At Hillsborough we begin to see indications of the mineral wealth of Albert County assuming a practical form. Very near the town situate on a fine expanse of interval near the river brink are the plaster mills of which Mr. Tompkins is the manager and part proprietor. Other members of the company reside in the state of New York, which is Mr. T.'s native state. He is particularly courteous, obliging and well informed. The works are the most extensive of the kind on this continent, and so far as known, in the world, and represent a large amount of capital. They include machinery (propelled by steam power) for breaking, grinding, and calcining the gypsum - for preparing it by one process for agricultural purposes, and by another for building purposes; also for making barrels, &c., &c. Indeed the works include the machinery for a grist mill which can be used if required, and worked by the steam power which is provided. The shipments of plaster are sent chiefly to the United States, to which about 25,000 barrels of plaster for building purposes are some years shipped and much more might be shipped were the tariff more favorable. It is met by a duty of 20 per cent in gold. Rock plaster for agricultural purposes is also shipped to the States, and the former kind, the stucco, sometimes even to Australia; lately a shipment of 400 barrels was made to Melbourne. The gypsum is hauled over a tramway of about three miles and a half in length. One horse can haul four loads of five ton each in a day, which involves a cost of eleven cents a ton. Including men who are working on roads, the works employ, at present, over 80 men. Some of these are, however, employed in making barrels. When the wood is prepared ready to be used one man can make as many as 18 barrels in the day; he receives nine cents a piece for them. They turn about 300 barrels a day. There is a fair margin of profit in the plaster business, which would be greatly increased if only the United States would consent not to make their own people pay so much for the plaster used in constructing their dwellings. The building of the railway - for which Mr. Tompkins generously offers his tramway, so far as it goes - would also help to increase the profits by lessening the cost of carriage. Of course this railroad must and shall be built. Ask Mr. Smart the contractor for the St. Stephen branch, or Mr. Buck; the engineer, of the same, ask the owners of the Saint Stephen Company or the Woodstock Company, whether or not the thing can be done, and they will tell you that the people of Albert County in general, and its public men and mining interests in particular ought to feel for ever disgraced if they do not build a branch railroad, which $50,000 in addition to the subsidy will be more than sufficient to construct and equip. But more of this anon.The famous Albert Mines are situated about five miles from Hillsborough. The appearance and value of the beautiful substance called Albertite and its history are so well known that we need not say any thing about them. On reaching the scene of operations a little village comes to view, as well as the buildings specially connected with the mining operations. Two shafts of one thousand feet each, have been sunk, and the supply of Albertite is taken from a vertical vein or rift or chasm which as followed in its descent still yields the precious deposit. Whether the supply is inexhaustible, or may soon be exhausted, is not known. No veins of equal extent have been found in the county, not withstanding a very large expenditure made in seeking for them. Small veins of equal quality have been found, but not as yet of sufficient extent to warrant mining operations. We were told that there are a hundred persons in the employment of the company, that from 18,000 to 20,000 tons of Albertite are annually taken out of the mines, more than half of which is shipped to Portland for the manufacture of oil, the other half being divided between Boston, where it is used in making gas, and St. John, where it is also made into oil. The value of the deposit is about $10 per ton, in gold, delivered on shipboard, and it is said that the cost of mining is about equal to one dollar per ton. The Albertite pays dividends to the non-resident company of over one hundred per centum, and a small royalty of 20 cents per ton to the province. The United States derives a large import duty, besides a heavy internal revenue tax from the article, which taxes are afterwards paid by all persons who purchase the oil in the British Provinces. In consequence of the manufacture being carried on in a foreign country, while a market is supplied in our own, this valuable deposit contributes more to the wealth of another country than that of our own. This is partly owing to the fiscal causes at work in both countries, and partly owing to the fact that our own people of ample means hesitated to take the risk of experimenting in the working of this valuable deposit. - Should the supplies of Petroleum shortly diminish to any considerable extent, the Albertite and also the oil bearing shales of this County, of which we shall hereafter speak, would be enhanced in value to

Daily Telegraph - Oct. 7, 1869 ...It is also said that the damage done to the Albert Plaster Mills and stores connected there with will not be less than $20,000. Albert Mines coal wharf was washed away with $6000 worth of coal there on, and about one-half mile of track is gone."

S.J. Daily News - Oct. 8, 1869 Storm damage article... The extensive plaster mills and warehouses were entirely surrounded by water and suffered extensive damage. A large quantity of manufactured plaster is damaged, and an immense quantity of material of various kinds has drifted away, and is rendered more or less useless. The plaster wharf and railroad are also broken up and scattered in all directions. It was feared at one time that the water in the boiler room of the establishment would cause an explosion, but no accident of this kind occurred. The Albert Mining Company's wharf, with a large quantity of coal, is completely scattered, a portion of their buildings destroyed, and the railroad broken up and driven away a distance of over a mile."

Daily Telegraph - Nov. 2, 1874 Edgett Landing. - ... Some years ago there was a plaster quarry opened here by Messrs. Howell & King, who shipped it at a pier in the neighborhood. Since the death of Mr. Howell, however, there has been little done here. We may also mention that there is another quarry at Hillsboro, owned by Mr. Blight, at the head of the ""Lake"". At Edgett's Landing considerable work has also been done by the East Albert Mining Co., under the superintendence of Mr.

Blight, who is said to be in charge of three companies, namely, the ""Princess Alexandria,"" the ""Prince of Wales,"" and ""East Albert;"" and although small veins have been found in those places, as we have already intimated, the result has not

Codes: HILL / J8 / IDX_Names: Grey Brook Gypsum; Albert Mines;
Chignecto Post - Sep. 9, 1880 Albert County.- The plaster mills of the Albert Manufacturing Co. are the features of Hillsboro'. The plaster rock is procured from quarries about three miles distant, and taken by rail to the mills, where the greater portion is shipped by vessel to Newark, N.J., where the Company manufacture it into plaster. The heavy duty prevents it being manufactured here for exportation. These quarries have been worked some 21 years, and are likely to yield abundantly for many generations to come. About 20 men are employed in them at present, under the direction of Mr. Wm. Shaugnessy, who has had a long experience in the work. The rock here has been excavated to a depth of about seventy feet. At the mills the rock is converted into plaster for use in the Dominion. The rough rock, being broken into pieces of convenient size, is placed in the crackers, which are something in the style of a coffee-mill, and reduced to small bits, the two crackers crushing about 125 tons a day. From these it goes by elevation belts to the hoppers, and is finally carried in the same manner, to the stones. These are four in number, and are on the same principle as millstones, five feet in diameter and made of granite. From the stones it emerges a fine powder and is carried to the bins, which are four in number and have 500 barrels in them at a time. Beneath these are four kettles which hold about 55 bushels each, and into which when heated the plaster is slowly deposited until, after the space of an hour and a half or two hours, they have the quantity desired. In these the intent heat of the furnace expels all trace of vapor from the plaster, which boils like water, and the steam escapes into a loft above. When the plaster is properly calcined, it is carried into pens, placed in barrels holding 300 pounds each, and is ready for market. Everything is done by machinery, which works to perfection, and though the mill is rather a dusty place for a man with black clothes, the process is well worth seeing. All the coopering and joiner work is done on the premises. The machinery is driven by a double engine of 125 h.p., of American make, the admirable mechanism of which is worthy of high praise. The mill can turn out about 500 barrels a day. The foreman is Mr. Elias Davis, who has been there some 21 years. The mill employs about 40 men. Besides the calcined plaster, the stone is ground, but not calcined, for use as fertilizer, the coarser and darker kinds being used for this purpose. It should be remarked, however, that dark rock and that which is pure white are alike equally white after passing through the furnace and being purified by fire. The Albert Manufacturing Co. is composed of Americans, Mr. Tompkins being the resident manager. It was at the house of this gentleman that Bayard Taylor sojourned when he visited Hillsboro' a few years ago. The poet-traveller did not unduly flatter this part of the country in his published letters ... I have before me two specimens of the mineral products of Albert Ore, a stone as white as driven snow, is the best quality of gypsum, form the Hillsboro' quarries. The other is as black as jet and shines with a brilliant lustre. It looks like coal, but it is not coal, though it bears a close resemblance to that mineral than to any other substance. Its weight is light in proportion to the bulk, it gives forth a peculiar odor such as kerosene has, and when a match is applied, it freely burns with a brilliant flame. It is the famous Albertite, it came from the depths of the deepest mine in America, where men toil for it, at the depth of 1,562 feet from the surface. So much has been written of the Albert Mines that an attempt to describe them would be out of place. They are the only ones of the kind in the world, and for thirty years they have been supplying Albertite to the gas works of America. The Albertite is commercially spoken of as coal, but it more resembles naptha in a solid state. It is used in gas works, in connection with other coals, for purifying, etc., and though in modern methods of gas making its use can be dispensed with, it is still largely demanded. Burning oil was formerly made from coal, but since the opening up of oil wells the process has been found too expensive, and Albertite oil is now a thing of the past. It is a pity, for it will be remembered as an illuminator far superior to the kerosene of these days, and in point of economy and comfort it was far in advance of the American rock oil, and immeasurably to the abominable Canadian trash with which so many of our people are familiar. In the raising of coal, large operations have been carried on here in the past. In one year 22,000 tons were raised, but in other years the quantity has been very much smaller than this. Of late the shipments have been small, for the mine has seen its best days, and will never yield as it did of yore. The Albertite has sold at all prices from ten to twenty one dollars a ton, the present price being about sixteen dollars. Every scrap of the mineral is now being cared for, and places which were treated with contempt in other years, because the coal was small in quantity and difficult of access, are now being dug out and graped in. The stockholders are chiefly Englishmen, and their investment has paid them well, the profits at one time being two hundred per cent. Some 85 men are now employed at the mine, many of these men have grown grey in the service and are familiar with every portion of the works. The machinery is, of course, extensive and of the best description. One notable portion is the pumping engine of 600 horse power, with a cylinder twelve feet long and five feet in diameter and which throws 45 gallons at a stroke. The engine is of Philadelphia make. Rich and rare are the fossil shales from the mines, and the specimens of fish, etc., found in the shale are in the collections of geologists the world over. Some of them are remarkable for their distinctness and beauty. It is a question how much more Albertite is in the country. It is believed that equally rich mines exist if they can be found, but though traces of the coal have been discovered in various places, no large deposit is known. It a mine were discovered it would probably be of less value than many imagine, for the abundance of the mineral would cause it to be much more than equal to the demand, and render it a drug upon the market. It is alleged that a well known prospector, now deceased, actually found Albertite in abundance only twenty five feet from the surface, but upon the discovery immediately ceased operations in that locality. It was supposed that he intended to keep his secret until the proper time came, when the other mines were exhausted. The Albert Mines and the Plaster Works have done very much for Hillsboro', and have given it an importance which it would otherwise never have

Kings County Record - May 16, 1930 The Natural Resources Of New Brunswick. - Interesting Paper Read by Mrs. Wm. King at Meeting of Newtown Women's Institute. - ... Our MineralResources. - More than 25 minerals of economic importance have been discovered in N.B. While considerable development work has been done, comparatively little headway work has been made. At the same time, N.B. may yet prove a great source of mineral wealth. Coal is the principal mineral mined - in Minto, Queens county. Gypsum is second in importance. Large deposits ofan excellent quality of this mineral are to be found near Hillsboro, Albert Co. The Albert Mfg. Co., Hillsboro, manufacture and export large quantities of commercial gypsum annually. It is one of our largest manufacturing concerns. Much gypsum rock is also shipped from Hillsboro. Natural gas and oil are produced in Albert county, nine miles south of Moncton. The gas is used for domestic heating and lighting in Moncton and Hillsboroand to some extent for power. The oil taken from the same wells is sold chiefly to the Canadian National Railways.Granite quarries are located in St. John, Charlotte and other counties, where granite stone is quarried for building purposes, monuments, etc.Limestone is found in many parts of N.B. The principal lime plants are in St. John county, where large quantities of commercial lime are produced. Last year nearly 13,000 tons of ground lime stone was ground from limestone rock by the Brookville Mfg. Co and sold to the farmers in all parts of the province. The use of ground lime stone for most of our soils has been found very beneficial and profitable to use.Brick is made from our clay in several places.Grindstones are manufactured and exported. Boring has been done in several places for copper, oil shale and other minerals but no great development has yet resulted. The value of the mineral production for New Brunswick in 1927 was $2,148,535."

Codes: HILL / S5 / IDX_Names: Grey Brook Gypsum; Albert County Coal (some Albertite);

Chignecto Post - Sep. 2, 1880 Albert County.-... Pleasantvale ... It is also alleged that a coal mine exists in this vicinity on the banks of the Little River. I had a talk with the man who found this mine, and is the only one who knows of its existence. He gives mysterious hints as to the locality, but will not show the spot to any one for a less sum than $500. The value of this mine has yet to be determined; the discoverer is not sure that it is worth anything, but simply and purely walks by faith. He also assured me that he had found a lead of quartz, with lumps of what he believed to be gold in it. I have found quite a number of these mine finders in this county, but, somehow or another, capitalists are slow to run wild over their discoveries. It is quite a common thing to be shown a lump of something claimed to be manganese, and to hear dark hints that there is more of the same kind not far away. In some districts nearly every man who owns a farm has a mine or quarry of some kind developed at a future day... Hillsboro... Derives much of its repute from the splendid quarries of gypsum in its vicinity, and from the famous Albert Mines, five miles distant. The export of these minerals has caused it to become quite a port for small shipping..... The Plaster Mills of the Albert Manufacturing Co, are one of the features of Hillsboro'. The plaster rock is procured from quarries about three miles distant, and taken by rail to the mills, where the greater portion is shipped to Newark, N.J., where the company manufacture it into plaster. The heavy duty prevents it being manufactured here for exportation. These quarries have been worked some 21 years, and are likely to yield abundantly for many generations to come."

Codes: HILL / Z2 / J8 / IDX_Names: Grey Brook Gypsum; Sandstone, Building Stone, Monument Stone, etc.; Albert Mines;

S.J. Daily Sun - May 10, 1886 Albert County (The Weekly Observer). - ... Albert County is rich in minerals which have not yet been properly developed. The coal, gypsum and freestone mines are about the only ones worked and these are imperfectly developed for want of sufficient capital.In 1881 the output of coal was 18,368 tons, of gypsum 435tons, of freestone 81,948 cubic feet. To persons withplenty of capital there are many excellent opportunities for profitable investment in stone quarries and other valuable minerals. A ready market for freestone is found in the United States, where it is worth at least $14 per ton. The estimated cost of quarrying and placing this stone on ship board is $4 per ton, so a healthy profit ought to remain after paying freight and other charges."

Codes: J5 / IDX_Names: Northumberland County Coal;

S.J. Daily News - May 17, 1875 Coal Discovery. - The Herald says that Mr. David O'Connell exhibited in Charlottetown on Tuesday, specimens of coal which he had picked out of a vein cropping out of the bank of Cains River, Blackville parish, in this County. The specimens exhibited resemble the anthracite coal of American mines more than it does the common bituminous coal of the Provinces, and it is asserted that in many places along the river and its branches rich veins of this mineral can be discovered almost at the surface of the earth."

S.J. Globe - Jan. 23, 1879 Coal in Northumberland. - Samuel Freeze, Esq., has commenced operations upon a seam of bituminous coal on the Dungarvon River, about seven miles from Doaktown. The seam lies horizontally and is between three and four inches thick. The coal is used by the blacksmiths in the locality and Mr. Freeze keeps two men employed in mining it. It is quite probable that other seams underlie the one being worked by Mr. Freeze and we learn that he proposes to make borings for the purpose of ascertaining whether they exist or not. - Miramichi Advocate."

Codes: J5 / IDX_Names: Northumberland County Coal;

Moncton Daily Times - Jan. 25, 1879 Coal in Northumberland. - Samuel Freeze, Esq., has commenced operations upon a seam of bituminous coal on the Dungarvon River, about seven miles from Doaktown. The seam lies horizontally and is between three and four inches thick. The coal is used by the blacksmiths in the locality and Mr. Freeze kept two men employed in mining it. It is quite probable that other seams underlie the one being worked by Mr. Freeze and we learn that he purposes to make borings for the purpose of ascertaining whether they exist or not. - Miramichi Advance."

Moncton Daily Times - Jan. 30, 1879 The Recent Coal Find. - We had the pleasure recently of testing some of the coal now being taken from a seam on the Bartholomew River, (not Dungarvon as stated in the Advance) five or six miles from Doaktown, by our enterprising friend, Samuel Freeze, Esq., County Councillor. The coal, though small, burns brightly, and is said by blacksmiths who have tried it, to be the very best they have ever used. The seam is a small one, about four inches in thickness, the mining of which about pays expenses. Mr. F. hopes to do better by and by, a hope which we trust shall be fully realized. The seam is being worked inwards from the bank of the river, and as there is considerable excavating to be done, the operating of such a small seam could only pay in a place where coal is scarce, as is the case at Doaktown, the article having to be hauled to that place from points where coal is imported, which makes it a luxury, and

Codes: J6 / IDX_Names: Apohaqui Albertite;

Moncton Daily Transcript - Mar. 6, 1885 Albertite at Apohaqui. - For many years it has been known that coal was to be found underlying the farm now owned and occupied by Joseph Reicker, and situated about half a mile west of Apohaqui Station. The farm fronts on the south side of the Kennebecasis and is crossed by the ICR, which here runs parallel with and quite near the stream. The land rises quite abruptly from the river and necessitated a deep cutting for the railway. It was probably while excavating for the railway that the coal was first discovered. It is of the kind commonly known as albertite. Whether it is to be found in paying quantities or not is likely soon to be tested. E.B. Chandler has been negotiating with Mr. Reicker and with A.B. Sproul, the owner of the adjoining farm, and, it is understood, will with others begin operations when the spring opens. It is to be hoped the venture will prove successful. A Gentleman who tested a sample of the coal some years ago believes it to be of good quality. Apohaqui is naturally excited over the possibility of a

S.J. Daily Sun - Jul. 6, 1886 Apohaqui. - The parties who are here prospecting for coal desisted after sinking a perpendicular trial shaft some fifty feet or more."

S.J. Daily Sun - May 26, 1886 Apohaqui. - Parties are still progressing with the hope of finding coal in this vicinity."

S.J. Daily Sun - Oct. 13, 1880 Mechanics Settlement Lake Leased. - Mr. Patrick, from Memramcook, formerly foreman of the Beliveau mines, has leased Mechanics Settlement Lake, Kings County, forthe purpose of mining the pottery clay for which the lakeabounds, it is said to ship to Philadelphia. The owners of the lake are Mr. William Webster and a widow. The terms of the lease are understood to be, besides earnest money and a bonus, ten cents per ton for every ton worked and

Codes: J7 / X1 / IDX_Names: Clay - General / Grand Lake Fire Clay, etc.; Grand Lake Coal;

S.J. Daily Sun - Feb. 6, 1884 (for the Sun) - The Coal Beds of Newcastle. - by Edward Jack. - The coal fields of Grand Lake containing, according to the reports of the Geological Survey of Canada, over one hundred and fifty million tons of that mineral, have been worked to a small extent for many years, the output continuing to be small, not on account of the difficulties attending the raising of the coal,but owing to the rude system of mining followed there, and the lack of the proper means to transport it to distributing centres. Now that there is a probability of the duty on coal being removed by the United States and a railway constructed to the mines, it is not at all unlikely that these despised beds may yet become a profitable source of revenue to a country which, once rich in timber is now suffering from its loss and that the lumbermen who once got his living by chopping trees above ground, will be able to do so now by digging in the shape of coal the remains of plants and trees which a kind Providence ages ago - long before the birth of man - hid away for his use in these last times. Never having paid any particular attention to these coal fields, I determined last autumn to give them a personal inspection so as to be able to speak advisedly respecting some portion of them at least. On the 9th of September last, I embarked in the company of a friend on board of the May Queen for a visit to Newcastle, Grand Lake. On board of the boat on our way up we met Mr. McFarlane, of that place, a very intelligent man, who has been for some time engaged in the coal trade, and from him gained the following information:- The yearly average yield of coal at Newcastle is about 6,000 tons, the cost of raising about $1 per ton, of transportation from mine to wharf at Newcastle 75 cents, freight to St. John about 60 cents. The work is all done by hand, but it could be much cheapened by the use of steam for pumping and hoisting, as the water is now carried away from the workings by expensive drains. The coal beds undulate with the surface of the ground, and when the summit of the undulations is reached, the working is abandoned. The average thickness of good coal is about 30 inches, but there is a good deal of difference in its quality. Newcastle produces the best coal in the market for blacksmith's use. A bed occurs at Mr. C. Sullivan's, about four miles from Newcastle wharf where coal can be shovelled from the surface at a cost of 50 cents per ton, and this is excellent for blacksmith's use. This bed is about 38 inches thick, though a parting of shale about 2 inches thick occurs on it. Mr. McFarlane thought that the hardest and best coal in Newcastle has not yet been reached, owing to the short distance to which the drifts are carried. A man will put out about a chaldron per day and for this he is paid $1; timbering costs delivered to the ground 15 cents, oil 5 cents, wagons about $6, picks $1.25, shovels $1. Coal is hauled all the way from half a mile to five miles. Drifts are run in from 300 to 400 feet, when work on them is discontinued. Air shafts have been put in in only one or two places. The hardest and best coal commences at from 3 to 5 miles from the Newcastle wharf and extends from 10 to 12 miles up the river of that name and to Little River, 12 miles distant, in the direction of Fredericton. Mr. McFarlane also thinks that the best coal fields have not yet been touched. He said that Samuel Green is now stripping six feet of earth from off the bed of coal, at which he is working, it being but that distance from the surface of the ground. This bed gives from 18 to 20 inches of good coal. There are places where there are but three feet of earth above the coal for extensive distances. The bed is here 18 to 20 inches thick. He had seen a bed of coal in the locality of Coakley and O'Leary farms which was from 36 to 38 inches thick. A square mile of this has been proved by workings. This, he said, was a solid bed. Much coal has been badly and dishonestly mined by digging the outcrop, which is mixed by earth and pebbles, and is of poor quality. The black shale which underlies the coal is frequently mixed with it, the difference between them not being evident to an unpracticed eye. In working a large bed (36 to 38 inches thick) not more than six inches of earth or shale require to be removed. The tops of the coal beds are generally sound, and there are but few places where these cannot be worked. They rise toward the west, and there are but few faults in them. The day after our arrival here on my hands and with one of the miners went to the face of the bed. The miner said that they usually left 8 or 9 inches to support the propping, as there were about 18 inches of fine clay beneath the bed. These 8 or 9 inches thus left are the most sulphurous part of it. Where we stood was but 12 feet below the surface of the ground. As we were sitting or kneeling in the drift, the miner took his pick and with it broke a piece of coal from the top of the bed; it broke, with a bright, glistening fracture, and appeared to be of excellent quality. This, said he, is the best coking coal. It was from 20 to 22 inches in thickness. For the distance of 12 inches below this the coal is harder and does not show so bright a fracture. By a mixture of the top and bottom, a good steam coal was made, so my companion said. In the afternoon we went to the place where Green was removing the earth from a coal bed having a thickness of from 22 to 24 inches. It was but six feet below the surface. Beneath this is a parting of two inches of shale, where there is another bed beneath it some six or seven inches thick. The men at work here informed us that Green paid them $1 per chaldron for digging this coal and placing it where he could reach it with his teams. Before concluding this short sketch it may be as well to inform the public how coal is mined and delivered on board the schooners at Newcastle. Drifts are run on an incline into the side of a ridge until the coal bed is intersected, and a drain is made to keep the water clear, often an expensive and laborious matter. After the drift has been timbered, which is done as the work proceeds, a track having wooden rails is laid down the incline and up to the face of the bed. By means of small four-wheeled trucks the coal is removed from the bed pushed by hand to the foot of the incline, up which it is drawn by means of a rude windlass where it is dumped on the ground, thence it is loaded on a common wagon having moveable sideboards, the average load for a pair of horses being one chaldron. The load is thence hauled from three to five miles to the wharf at Newcastle, when the sideboards being removed it is allowed to fall to the ground, thence it is again carried by wheelbarrows, containing one barrel each, on board of a schooner lying at the wharf. Three days work of four men is the time ordinarily consumed in loading one hundred chaldrons, the expense attending this must be 25 cents per chaldron. Were there ordinary tramway transport and proper discharging appliances at the lake this sum would be amply sufficient to carry the coal from the pit's mouth and load it on board of the schooner."

Codes: J7 / X1 / Y7 / IDX_Names: Clay - General / Grand Lake Fire Clay, etc.; Grand Lake Coal; Macadamite - Queens Co.;

Weekly Record - Fri., Feb. 3, 1903 A Queens County Industry. - An Ottawa despatch tothe St. John Telegraph says: 'Your correspondent learned today of an enterprise in New Brunswick likely to assume dimensions of grand proportions. Representatives of American and Canadian capitalists forming the works which owns the patent right for the Macadamite metal were in Ottawa today on business in connection with the new metal. It is intended to at once enlarge the works which have been established at St. John, but those interested have a larger plan in view. It is nothing less than the establishment in the vicinity of the coal fields in Newcastle, Queens County (N.B.), of works for the manufacture of aluminum, which is one of the elements of the macadamite metal, and for which there is an enormous and rapidly increasing demand. Two essentials are necessary for its successful manufacture, cheap clay of the proper percentage of oxide of silica, and cheap power. It appears that underlying the coal deposits ofQueens County (N.B.), is an abundance of fire clay which has been carefully tested and found suitable for the manufacture of aluminum. The abundant supply of coal ensures the other requisite of cheap power. Arrangements have been made with the New Brunswick Coal & Railway Co. for subletting a portion of its areas and a company to be called the Aluminum Production Company of New Brunswick is now in process of organization. The company will use a large quantity of coal in its factories and employ several hundred hands. Large contracts have been entered into for the supply of the metal to railway companies, and others, and those interested are confident of success."

Codes: J8 / IDX_Names: Albert Mines;

N.B. Courier - Dec. 14, 1850 and Headquarters - Dec. 18, 1850 Mineral Wealth of the Province. - About three months ago we alluded to some rich seams of Bituminous or Pitch Coal which had been discovered in Albert County, and we have now the satisfaction to state that Mr. Duffy, the party who discovered and has been working the coal mine at Shepody, has sold his lease or mining privilege to Messrs. Allison and Spurr, of this city, for œ5000, which does not, of course, include the right of soil. One shilling per chaldron is also payable to the Provincial Government on the coals excavated. There is little doubt that this speculation will turn out very profitable to the parties interested, as the first five hundred chaldrons that can be got out, have already been contracted for in New York at ten dollars per chaldron. We also learn, that since the bargain was concluded, another party, well acquainted with the value of the coal, would have been willing to have given œ500 more for the same lease, had the arrangement not been already made, and it may therefore be presented that Messrs. Allison and Spurr have made very advantageous terms. The seam of coal is twelve feet wide and sixty-two feet deep. This province appears destined by nature to rise into a prominent position yet as it contains within itself so many resources, which require only to be known and developed in order to their becoming sources of wealth to their possessors, and beneficial to the people at large."

Weekly Observer - Dec. 17, 1850 and Morning News - Dec. 20, 1850 and Miramichi Gleaner - Dec. 24, 1850 Messrs. Allison & Spurr, of this City, have purchased the rich mine of Bituminous Coal discovered in Albert County, New Brunswick by Mr. Duffy for the sum of œ5000. This coal is worth $10 per chauldron in New York, and if it holds out both as regards quantity and quality, of which there appears to be little doubt, the purchasers will reap a handsome reward for their

N.B. Courier - Feb. 16, 1850 Shepody Coal. - A small cargo of this coal was recently brought here for sale, which, however, was not very readily disposed of at first, its qualities not being generally known. It turns out, that although extremely light in weight, not being heavier than charcoal, it is of a very bituminous nature, and contains a large proportion of gas. The Gas Company purchased upwards of thirty chaldrons of it, which, if it turns out profitable, will increase the demand, and do something towards developing the resources of the country."

Weekly Observer - Feb. 19, 1850 Shepody Coal. - The Gas Company is now making an experiment with a quantity of Shepody Coal, recently brought to market, which, though light in weight, is stated to contain a large quantity of gas. Should the experiment prove favorable, the coal will, of course, be in demand, and become a valuable article of export from that portion of the Province, and be a source of general advantage."

Codes: J8 / IDX_Names: Albert Mines;
Weekly Observer - Apr. 8, 1851 For the Observer. -- Hillsborough Bituminous Coal, versus Asphaltum. Mr. Editor. - I have lately read a communication in the Halifax Acadian Recorder, headed ""Asphaltum,"" purporting to have been written by Abraham Gesner, our former Provincial Geologist. As the statements contained in this publication are calculated to mislead the uninformed regarding the nature of the combustible Bituminous Mineral discovered in Albert County, and also as regards the priority of claim that Dr. Gesner sets up as to being the original discoverer of the application of Asphaltum to the production of Illuminating Gas, I hope you will allow me a place in your columns for the purpose of pointing out such of the statements therin set forth, as are not founded on fact, or prove contradictory in themselves. With regard to the combustible Bituminous Mineral found at Frederick Brook, Hillsborough, County Albert, that Dr. Gesner will have nolens volens to be Asphaltum, I am prepared to show that it is a Mineral Coal (his garbled comparative statements of analysis to the contrary notwithstanding; and that even supposing this substance to be Asphaltum, (which it is not), that I have extracted Illuminating Gas from it, in the St. John Foundry, many years ago - long before the Doctor favoured this Province with his Geological Reports, which Reports, to use Dr. Johnston's words, ""proved unfortunate in many ways, as they have not only injured his own reputation for general accuracy and diminished the confidence with which his Reports generally were read, but it has lessened the confidence of the people in the predictions of science generally, and probably prevented or retarded other researches which might have been undertaken in reference to the Geology and Mineralogy of this Province."" - Johnston's Report, page 14. Dr. Gesner informs us that Asphaltum is not a Mineral, for it is the product of organization, although found in the earth, and must consequently be a Fossil. On referring to our English Dictionary, I find the word Mineral defined to be ""a fossil body- matter dug from a mine."" Now if Asphaltum be a fossil body and dug from a mine, ""argal"", it must therefore be a Mineral, notwithstanding the Doctor's definition to the contrary; and does he not furnish a proof against his own argument, when, in a following paragraph, he quotes from Brand's Chemistry, and tells us that ""Bitumens are fossil substances."" I may also add a few quotations from standard writers - ""Bitumen is a combustible Mineral"" - Maunder's Scientific Dict. ""Bitumen - a term that includes a considerable range of inflammable mineral substances."" - Ure's Dict. Chem. ""So closely do some Bitumenized Coals approach to the Mineral, Bitumens, some of which have even been denominated Coal, such as the solid Bitumens of the Tropics, the Asphalts of France,"" &c. - Taylor's Statistics of Coal, p. ix. I might quote from many other standard works to prove that Asphaltum is classed as a Mineral body and that its supposed organic origin does not take it from that category of substances; but let these suffice. Dr. Gesner also offers as a proof of this Mineral's being Asphaltum, the great difference of its specific gravity from that of some kinds of Coal; but he might, with equal propriety, try to prove that the trunk of a Cork or Pine tree is not Wood, because it is so much specifically lighter than Box Wood or Lignumvitae. He asserts that ""the celebrated Chemist, Thomson, inclines to the opinion that Coal is not a compound of Bitumen, as has been supposed."" This is surely a great mis-statement, for on reference to the last edition of Thomson's work on Chemistry, vol. II, p.370, he says that ""Bitumen united to Charcoal in various proportions constitute the numerous varieties of Pit Coal."" Dr. Gesner may, however,

exercise his pertinacity and also deny that Pit Coal is a mineral substance; he may do so with equal propriety. Let me now turn to the distinctive charcoal characteristics of Asphaltum as displayed by the action of re-agents on that substance. The Doctor has mentioned correctly its solubility to Turpentine and Naptha - that with fixed oils it forms Japan Varnish, &c. I beg to exhibit in juxtaposition my own experiments with the action of three solvents on the Mineral found at Frederick Brook, which he will insist on calling Asphaltum, and contrast with it the well known action of these bodies on true Asphaltum:- Asphaltum Mineral From Frederick Brook Five parts rect. Petroleum Ten parts of highly rect. Dissolve one part of petroleum did not Asphaltum without heat. - dissolve one hundredths Thomson's Chem. V. II., p.370 part of the mineral after remaining in contact 14 days. The solution leaving no stain or evaporation from white paper. Asphaltum is readily soluble Naptha only dissolved a in Naptha, and forms a good very minute portion of Varnish. - Brand's Ch., vol. the Mineral often II., p. remaining heated in a sand bath 4 days. The solution on evaporating left a yellow adhesive matter, unfit for Varnish, as it did not dry. Caustic Potash dissolves Caustic Potash produced 3 Asphaltum. - Ure's Dict. No action on the Mineral. Pure Asphaltum dissolves Turpentine and fixed in Turpentine, without leaving oils, like Naptha, had any residuum. - Ure's Dict. Of little or no action, Minestherefore will not make varnish, as Gesner states. It will be evident from this comparative statement, that the chemical behaviour of this Mineral is quite different from Asphaltum, and that Dr. Gesner's assertions regarding its solubility in Turpentine and Naptha, &c., are quite erroneous. To prove this more fully, I offer the following certificates from eminent Chemists, one of a much later date from Dr. Chilton than the one published, as that Chemist has since had an opportunity of more carefully analyzing the Mineral, which he now pronounces to be Coal; and, I may add, that on the application of Dr. Gesner for a renewal of the first certificate of analysis, that Dr. Chilton refused to do so, in consequence of its having been erroneously called Asphaltum, a fuller investigation having disclosed the fact that the mineral must be classed as Coal. ---""The sample marked 'Coal from Hillsborough,' is unquestionably to be classed as Coal, being, as the analysis shows, a highly bituminous variety. - I have subjected it to the test of boiling Turpentine, as well as to the action of Chloroform, but in either case only a small proportion is dissolved. It does not melt with heat, while Asphaltum is easily melted, and dissolved readily both in Turpentine and Chloroform. The analysis shows it to yield, Vol. Matter ... 58 48 Fixed Carbon .... 40 86 Ashes ... 66 -- 100 00 (Signed) James R. Chilton, M.D. New York, Feb. 10, 1851. Chemist -- I have examined the same Mineral (from Hillsborough, New Brunswick), analyzed by Dr. Chilton, and fully agree with him in his results. It is a true coal and not Asphaltum. (Signed) John Torrey, Professor of Chemistry, &c. Laboratory of the Coll. Of Phys. & Surg's.} New York, Feb. 18, 1851 } -- I have examined the Coal from Hillsborough, N.B., and find it to be a highly Bituminous Coal. I fully concur in the opinions of Drs. Chilton and Torrey, as expressed within. (Signed) B. Silliman, M.D. Professor of Chemistry. New York, Feb. 26, 1851. 4 -- To judge merely from the external character of the substance exhibited to me along with the foregoing certificates, I should not hesitate to pronounce it a Coal. It resembles cannel coal in many respects, but does not appear to cleave in the manner the latter does. When a smaller specimen was exhibited to me some weeks since, it struck me as having a resemblance to Jet, but it wants the lignaceous structure which is generally obvious in that fossil. (Signed) Jas. Renwick Columbia College, N.Y. } 3d March, 1851 } -- Philadelphia, 13th March, 1851. Dear Sir. - The specimen you sent yielded upon an ordinary analysis - Water at 212ø... 1 75 Volatile matter ... 59 75 Carbon ...38 25} 38 1/2 Ash ... 0 25} Coke -- 100 00 The analysis would indicate it to be Bitumen, as well as its general behaviour, the facility with which it swells by heat, the very porous and light character of the coke, but its behaviour to reagents shows it to belong more to Bituminous Coal. I regard it therefore as Bituminous Coal of a somewhat, but not wholly, anomalous character. Yours truly, Jas. C. Booth Dr. J.R. Chilton, New York. -- I have examined with much care a specimen of Mineral combustible matter, left with me by Messrs. Cook & Smith, of New York, and said to have been found in Hillsborough, New Brunswick. It is my decided opinion that this substance is a highly bituminous Coal. It differs from Asphaltum in not being fusible; the heat merely causing it to swell, as it does some of the varieties of Bituminous Coal. It is likewise insoluble in Spirits of Turpentine, even at boiling heat; whereas Asphaltum dissolves readily in that fluid. This new variety of Coal is remarkable for the large quantity of volatile matter which it contains, nearly equal to 60 per cent., while the quantity of ash, when it is perfectly burned, amounts to less than one per cent. John Torrey, Laboratory of the College of Physicians & Surgeons, New York, March 13, 1851. -- The above certificates must satisfy any reasonable mind that the bituminous mineral found at Frederick Brook, Hillsborough, County Albert, is most indubitably a Coal. As the last Mail from England has just put me in possession of a number of other certificates, from some of the most eminent Mineralogists and Chemists in Britain, all of which I intend to publish on some future day, in the meantime permit me to present the following from my old instructor, the celebrated Dr. Ure:- -- London, 24 Bloomsbury Square, 14th March, 1851. I hereby certify that the shining black solid pieces which you put into my hands this morning, are lumps of Pitch Coal, a true Mineral of the Geological Coal formation, and therefore in every sense of the term popular, scientific and legal, a truly Mineral production or substance. I am your's truly, Andrew Ure, M.D., F.R.S. -- Let me now advert to Dr. Gesner's statement, ""that Asphaltum differs altogether from Coal in its Geological position and relations. Coal occurs in the earth in regular seams which run parallel with the strata of the bordering rocks. Asphaltum does not occur in this manner, but in irregular masses at the surface, or in dykes that cross the regular strata at all angles."" True, and he shows a complete ignorance of the locality where the mineral is found, or a want of that acumen for observation which, as a Geologist he ought to have possessed, when he pretends to affirm that the mineral in question is found in Hillsborough, crossing the regular strata; so far from that, the main seam at the Duffy mine, Frederick Brook, as well as three small ones that I discovered in that neighborhood, run parallel with the bordering strata of true Coal shale, which takes a North East and South West direction, which is generally the course of all the great mineral veins that have as yet been discovered in this Province. So much for the truthfulness of Dr. Gesner's assertions. I now proceed to direct attention to the strange denial of his own former printed statements regarding the Coal found at Frederick's Brook, and compare his present with his former assertions. He now says, ""In those Reports, I have noticed the existence of both Bitumen and Coal, but the latter is nowhere represented as being at or near the site where the Asphaltum is now dug."" Now, the mineral that the Doctor asserts to be Asphaltum, is extracted from a mine sunk in the bed of the Frederick Brook; and to show the inconsistency and prevarication of his present statements, I quote from his third Geological Report of the Province, page 27, the following:- ""Some information had been received of indication of Coal at Frederick Brook, a branch of Weldon's Creek, emptying into the 6 Petitcodiac, between its mouth and the Bend. Assisted by Mr. Edgett and two other persons acquainted with the woods, I proceeded to examine the Brook and the ravine through which it passes, and having chosen a season of the year when the streams were low, which enabled us to wade along the bed of the Brook, we collected all the information the means employed could afford. ""The first indicators of coal were observed near a meadow formed by an ancient beaver dam, about three miles from the river, and the same distance from its confluence with the Memramcook. The sides of the ravine and bottom of the Brook are composed of sandstone shale, bituminous shale, and Coal; frequently concealed beneath detritus and the rubbish of the forest. The strata are intersected by the stream, and run nearly East and West with a general dip to the South. The coal was found most abundant about the beaver dam, and exists in several separate strata, the largest of which is about nine feet in thickness. The quality of the Coal is superior to that of the Memramcook, on Stephen's farm, mentioned in my last Report. A quantity of it was collected and fired in the bed of the stream; it ignited readily, and burned with great splendour."" How can the Doctor, after publishing the above statement, assert that he has nowhere represented coal as being of or near the site where his Asphaltum is dug. Verily the old adage is true - ""Certain persons should have good memories."" I now have to notice his claims for patents, applied for in the Provinces and other parts of the world, for his discovery of the application of Asphaltum in the manufacture of Illuminating Gas. I can prove, by many affidavits from persons formerly in my employment, that I manufactured Illuminating Gas from the Mineral Coal, alias Asphaltum, brought to me by Mr. John McRae, from Frederick Brook, in the year 1835. I also informed the Manager of the St. John Gas Company's Works, that the mineral in question yielded a great amount of gas, and was to be found in the neighborhood of Shepody, and that I gave him this information long before the Messrs. Duffy discovered the outcrop, or had obtained a Crown Lease, as the following certificate will testify:- Saint John, April 2d, 1851. Mr. Foulis mentioned to me long before I heard of the Messrs. Duffy's discovery, that he had experimented many years ago with a Coal found near Shepody that yielded a great volume of rich illuminating Gas. When the Coal was brought to this City in 1849, I extracted gas from it at our works, and found it to agree with Mr. Foulis' previous description. G. Peebles, Manager Gas Works. The manufacture of Illuminating Gas from Asphaltum has been long practiced in France and therefore 7 any pretensions that .?... The Doctor or I might ..?.. To the invention would we be looked upon in the light of a mare's nest discovery, for if he will go to his library, and refer to Knapp's Chemistry, 1846, page 161, he may read as follows:- ""Coal, Fat, Oils, Resin, Tar, Asphaltum, Soap Water, and the refuse of animal bodies, are all practically employed, according to the locality, in the production of Illuminating Gas."" I may also refer to that excellent work, ""Taylor's Statistics of Coal,"" page 452, where speaking of the manufacture of Gas from Mineral Bitumens, the author states ""This substance is already known in France under the name of the Sellequo Gas."" Dr. Gesner was for some years our Provincial Geologist, and received large sums for his services. - I do not blame him for that, but it is surely meanness that can prompt him to the endeavour of appropriating the reward that should belong in those who seek and find what his obtuseness could not discover. I am willing, in this instance, however, to allow that the doctor made a good guess; the nine feet seam mentioned by him as existing above the beaver dam, has never been seen by any other person, although diligently searched for; the outcrop of the Duffy seam being quite a narrow vein, which crosses the bed of the Brook, and if he could then see it nine feet thick, he must have as good an aye as his old German relative, a real farenkeeker! A most penetrating ocular! That could see through opaque matter; else his nine feet seam must have rested, like his claims to the patent discovery, on the ""baseless fabric of a vision, and left not a wreck

Codes: J8 / IDX_Names: Albert Mines;
N.B. Courier - Feb. 1, 1851 and St. Andrews Standard - Feb. 5, 1851 and Weekly Observer - Feb. 11, 1850 Albert Coal Mines:- We have much pleasure ininforming our readers that the company which is working three mines is prosecuting the undertaking with great vigour, and with every prospect of success. There are already a great number of persons employed excavating the coal, besides about thirty teams, who are daily engaged in conveying it from the mines to the place of shipment. We were, yesterday, shewn a specimen of the production of these mines, which appears to be a very pure and highly bituminous description of cannel coal, very well qualified for the manufacture of gas. We have been informed that the experiments made with it at our Gas Works shew it to be more valuable for this purpose than almost any other kind of coal yet used, and that a ton of it will produce a greater quantity of gas, at less expense, in shorter time, and with less purifying, than a similar quantity of the description of coal now in use. And we believe that the St. John Gas Company will find it to their advantage to procure their future supplies entirely from this source. The company now working these mines intend carrying on their operations extensively, and as they will prove a valuable source of export from our Province, and give employment to a large number of persons thereby benefitting the country, we wish them every success in their undertaking."

N.B. Courier - Jul. 12, 1851 At a meeting of the Boston Society of Natural history, lately, Dr. C.T. Jackson called the attention of the Society to the subject of the Asphaltic Coal from the head of the Bay of Fundy, of which a specimen was exhibited by him at the meeting of the 16th April. The specimen exhibited showed the vein of the coal at right angles to that of the wall rock, and it was thought at the time that this was the general direction of the stratum, a position in which coal deposits had been never before observed. During a recent visit to the mine from which the specimen was taken, Dr. Jackson had ascertained that the deposit is in reality parallel to the adjoining strata; but the specimen had been obtained from a vein one foot in width, filling a seam caused by a shift of the overlaying rock, by which it communicated with a bed of coal above. The strata are inclined at an angle of from 70ø to 80ø. The depth of the shaft now being worked is 70 feet with an angle of 75ø. The coal is columnar, so that it cannot be worked in the usual way by undermining it. is taken out by means of a series of grades. It requires no blasting ly detached with the hands evidence that the strata PAGE Black and White gypsum with the coal. TORN The strata adjoining Fine grained shale ses like pebbles, ganoid fishes, wh eddies and whirl are also found formed from deposited by was so fortun species of gan them nearly Society. Dr. Jackson coal deposit trees,"

Weekly Observer - Jul. 22, 1851 For the Observer. Hillsborough Coal vs, Asphaltum To J. Amherst. Sir, - A few weeks since has elapsed since your communication, dated Amherst, June 18th, and headed ""Bitumen of New Brunswick"", appeared in the Halifax British North American. As this publication, however, did not meet my eye until lately, I hope you will not ascribe my long silence to any want of courtesy in acknowledging the gratuitous favor that your condescension has bestowed on the humble individual whom Dr. Gesner, from his 'elevated position among the learned', think unworthy of notice. But, from having fewer pretensions to science, you, Sir, have kindly vouch safed to notice my communication on the subject of Hillsborough Coal in order (as you say) that it might not pass into oblivion unanswered. This condescension, on your part, I duly appreciate, but, I candidly confess, I am at a loss whether most to admire your modesty when you yield the palm of science to Dr. Gesner, or your chivalrous conduct in volunteering to become his champion and buckling on his armour, - but allow me to give you a caution - consider that discretion is the better part of valour - that a 'big bone' does not always indicate quantity of brain. There are two allegations in my communication, ""which,"" you say, ""in justice to those who may have read them, should be contradicted."" Let us see how you have made out your case, and how you have contradicted them. The first allegation that you wish to deny, is my statement ""that Professor Johnston, in his Agricultural Report, condemns the representations made by Dr. Gesner, for overrating the mineral resources of the Province."" Now, I did not make such an allegation, although it is true that Professor Johnston did state that the Doctor ""ministered a little too strongly to the vulgar views of immediate profit, and created expectations which his own labours did not realize."" The allegation, then, had I made it would have been strictly true; but it was for the purpose of exposing Dr. Gesner's inaccuracies, and their effects, that I gave the quotation, which you acknowledge I stated ""enough"" from the Agricultural Report, which proceeds thus, when speaking of Dr. Gesner's Reports, the opinions he expressed, and the hopes he awakened, ""proved unfortunate in many ways, as they have not only injured his own reputation for general accuracy, and diminished the confidence with which his Reports generally were read, but it has lessened the confidence of the people in the productions of science generally, and probably prevented or retarded other researches which might have been undertaken in reference to the Geology and Mineralogy of the Province."" You say it was unfair in me to give the above quotations, because Dr. Johnston's Report shows that he confided in the labours of Dr. Gesner. If the Professor has blown both hot and cold, he has shown his inconsistency; but I cannot perceive that he has placed the least confidence in the results of Dr. Gesner's labours. He speaks of his ""imperfect Geological Map, which marks red rocks where no true red rocks occur,"" and he regrets that the five years of his engagement had not resulted in rendering it more complete. Indeed, Dr. Robb's two letters, which the Professor has inserted in his Report, (see pages 5 and 16,-NOTE - one missing) are evidently intended to show up Dr. Gesner, and expose his ignorant, blundering assertions. Professor Johnston, in his Notes on America, has not said one word that gives evidence that he has (as you say) ""since repented of the severity that he applied to the discoverer of the Bituminous District."" I cannot perceive the ample acknowledgement that you speak of, and still less has he named Dr. Gesner the discoverer of the Bitumen, - that credit he gives to Dr. Robb, who affirmed that the mineral which Dr. Gesner called Coal proved to be Mineral Pitch, or hard Bitumen; and from this circumstance originates all the difficulties and trouble which Dr. Gesner has caused the Lessees of the Crown to experience. But as Dr. Robb has not exhibited any satisfactory proofs, I feel convinced that the mineral in question is what Dr. Ure has named it, ""Pitch Coal, a true mineral of the Geological Coal formation, and therefore, in every sense of the term, popular, scientific and legal, a truly mineral production or substance."" I do not find, therefore, that the quotation you have given from the Notes has any application whatever - it does not connect him in any way with the Hillsborough Coal or Asphaltum. The only remark that occurs which mentions Dr. Gesner, says, that ""he has recently secured a patent in the Provinces for a form of retort, adapted to the use of the Pitch of Trinidad, from which circumstance"" he infers ""that Dr. Gesner considers it possible to import and manufacture gas from this substance in Nova Scotia and New Brunswick cheaper than from Bituminous Coal of the country."" - Now how does this quotation, which you have given at length, affect the truth of my statements? What bearing has it on the subject? Or how does it discredit my allegation? Where can you find in it ample acknowledgement to Gesner for the severities formerly used by Johnston? - You say strange that I should ""quote Professor Johnston for the purpose of proving that bitumen or Asphaltum is coal."" I also say strange that you should say I did so; and this false accusation shows that the writer under the signature J. ongs to that class of individuals who have little regard for the truth, when it suits their purpose to utter a falsehood. So much for your first allegations. I will now endeavour to show that you are equally unfortunate in overturning the second - where you attack my veracity for stating that the main Coal seam runs parallel to the Coal shales, which take a Northeast and Southwest direction, whereas you say ""it has been proved on oath, as well as by the declarations of three different Geologists, that this statement is unfounded and untrue, as they declare that the material is a vein and not a seam, that it does not run parallel with the

strata, and that its course is not Northeast and Southwest."" Now, the fact is, that your assertions are quite untrue, as I shall prove. The three Geologists referred to are, Dr. C.T. Jackson, Dr. Robb, and R.C. Taylor, only one of the three gentlemen has as yet been sworn, R.C. Taylor, and although he says the mineral forms a vein, he on oath, stated that ""it appears to be enclosed in a series of calcareous shales which occupy a belt or range passing through the country in a Northeast and Southwest direction."" My statement as to the direction of the strata is therefore proved to be correct by your own sworn geologist. As to the parallel course of the seam and bordering strata I quote as follows, from the St. John Courier, of the 12th inst. In reference to a Meeting of the Botanic Society of Natural History, ""Dr. C.T. Jackson stated, that during a visit to the mine, he had ascertained that the deposit is in reality parallel to the adjoining strata."" It must therefore be contained in a seam, and here my assertion is confirmed and you, Sir, are guilty of charging me falsely with making statements that prove my assertions to have been correct. Therefore, Sir, when you attempt to write in future, I hope you will have more regard for ""truth and decency"". In this instance you have only exhibited a wish to be coarse and personal in your remarks, but in doing so you have only shown that ungentlemanly vulgarity incident to an uncultivated mind. You have falsified your own statements, you have failed in offering any proof that my allegations should be contradicted. Your stale witticism about all fool's day, and Tom Fool's day, has so little to do with the question, that you would rather discredit Amherst, were you an inhabitant there, as you seem fitter for wearing the cap ornamented with bells than handling the cross quill. Your dull inuendoes will not pass for wit, nor your arguments for logic, even in Amherst where you are better known than respected. You are not an inhabitant of that pleasant village; you have counterfeited the pass mark of a respectable individual, who has assured me that he repudiates your production. It is evident that it emanates from the same source that produced the forged Custom House letter, and from the same hand that endeavored to pass off a specimen of Maltha for Hillsborough Coal. The statement repeated the third time, that Dr. Gesner deems me unworthy his notice, smells of his shop; however, you may rest assured that, notwithstanding Dr. Gesner has written

Codes: J8 / IDX_Names: Albert Mines;

Weekly Observer - Jun. 24, 1851 NOTE: New Brunswicker issues for this period not available on microfilm Hillsborough Coal vs. Asphaltum. - To the Editor of the New Brunswicker. - Sir, - I perceive that, during my absence from the City, you have given place in your columns to an anonymous correspondent, who, under the signature of W., has been endeavoring, during this dull season to amuse your readers, and, by a display of his native talent, astound ""the admirable wit"" and humour of his communication all who view with disapprobation and disgust the fraudulent attempts of cupidity, or the presumption of that empiricism that would erect as the standard of intelligence the miserable efforts of its own mean, vulgar mind. Yet Mr. Editor, although I can smile at the clumsy endeavour of this writer at being facetious, and with his attempt to laugh at this wonderful effort of his own wit, allow me to say that I do not think you are quite justified in publishing, under the sanction of a fictitious signature, any attack on private character, that impeaches its veracity, unless you have had some reason to suspect that the allegations were true. I do not mean to enter the lists of controversy with Dr. Gesner, or his amannensis, while they write under an assumed signature, as under that guise assassin-like, they would stab in the dark; but let them come fairly forth, and I fear them not, for truth is powerful and will prevail to a few brief observations on facts that may be easily understood. Dr. Gesner, in a communication addressed to the Directors of the Halifax Gas Company, dated April 22d, (some hundred copies of which have been extensively circulated) has made several untrue imputations regarding my motives, &c. I am there represented as the advocate of that Company - this is quite a misrepresentation. I know nothing of that Association, or of their transactions with Dr. Gesner; I never had any communication with them directly or indirectly. On enquiry, I learn that the Directors are a highly respectable body of Gentlemen, and if they republished my remarks on Dr. Gesner's previous mis-statements, I hope it was with a view to expose false pretensions and a dishonest attempt. I have referred to Taylor's statistics on Coal, and Knapp's chemistry, which prove most incontestably that Asphaltum has been long known and practically employed in the manufacture of Illuminating Gas, so that Dr. Gesner places himself in a most absurd position, when he states, that in order to seize upon his discovery, infringe his patent and bring the Asphaltum within the limits of the Crown reserves, it was necessary to form a 10 combined league against him. The Dr. wisely keeps silent as to Knapp's statement respecting the use of Asphaltum in the manufacture of Gas, but he cunningly, to withdraw attention from that fact, endeavours to impress his readers with the idea that I have given an altogether incorrect quotation from Taylor, altho' I have used that author's own words. Does he mean to prove by the aid of native talent that this mineral oil which is used in France for the manufacture of gas, is not a Bitumen, although distilled from bituminous schist? This is quite in keeping with other statements he has made. Dr. Gesner asserts that he was the first person who ever yet described the asphaltum district of Hillsborough; and in a following paragraph he admits that he described the country where the Asphaltum is found as a coal field! - Strange! In another place he states, ""but the latter (coal) is nowhere represented as being at or near the site where the Asphaltum is dug. Strange again! - as I have shown that he formerly described in this very locality, a discovery made by the aid of his farren keeker of a nine feet bed of coal! How consistent! How truthful! How honest are these statements! If the Dr. knew, as he now asserts, that there is no coal at or near the locality where his Asphaltum is dug, then he might have stated in his Third Report to our Government ""what he knew to be a positive untruth."" And, again, if he knew there was an Asphaltum vein in Hillsborough, did not the Doctor commit a fraud against this Province by concealing a Geological fact, which he afterwards intended to apply to his own individual advantage? It is then obvious, if we are to credit his present statements, that while acting as our Provincial Geologist he was receiving money under false pretensions and he thus places himself in a position before the public not to be envied - a position where all the logic and sophistry of W., or the unblushing effrontery of his village petrifogger, can avail but little, for the finger of scorn will be pointed in that direction. Dr. Gesner seems to have got a useful tool by the employment of W. I have no doubt he is capable of doing a good deal of his dirty work; he seems to have begun in earnest, but although W. may be a person learned in the Law, he will not be a whit more respected for giving his hireling advocacy to a cause that requires so many falsehoods for its maintenance. Let me here just notice one of the many untruths published in the last co-partnership production. Quoting from my first of April communication, W. states that ""Mr. Foulis next says, 'Dr. Gesner informs us that Asphaltum is not a mineral, for it is the product of organization, although found in the earth, and must consequently be a fossil.' - now Dr. Gesner says no such thing, and Mr. Foulis knows he did not."" I know that Dr. Gesner did assert such a thing, and 11 as proof, I refer to his publication of the 13th of arch, where he says, ""Asphaltum is not a mineral. A mineral is a substance which does not possess organization and is not the product of organization,"" and, quoting from Brand informs us that ""bitumens are fossil substances."" Now I have not given a mis-statement of Dr. Gesner's definition, and the Doctor ""knows I did not."" W.'s false accusation to the contrary notwithstanding. I also again repeat the assertion, that Dr. Gesner offered as a proof of the substance being Asphaltum, the great difference of its specific gravity from some kinds of coal, for after giving the analysis of six varieties of English coal, he goes on to state, ""The difference between Coal and Asphaltum is less than that of any kind of Coal."" My wooden argument is therefore quite sufficient to upset the ""shallow artifices"" of my antagonists, and my former statement remains unanswered. I am represented as having asserted that ""Dr. Gesner admits that some Coal is as light as the Hillsborough Asphaltum."" This is a false statement. I said ""no such thing"", and Dr. Gesner ""knows I did not."" In speaking of the Geological position of the Coal at Frederick's Brook, and what the Doctor now finds convenient to call Hillsborough Asphaltum, my character for accuracy is said to have suffered, because I quoted from his Third Report ""that the strata had a general dip to the South."" Now my opponents say, ""that instead of dipping to the South, it sinks perpendicularly into the earth, with a slight inclination to the south - that the deposit is without any floor, roof, fossils, &c."" I have yet to learn how the strata can be perpendicular and at the same time have an inclination to the South. How logical! How argumentative! How consistent!!! As to the fossils, I will with much pleasure, show any gentleman who may call on me, both animal and vegetable organic remains, lately brought from thence; and as to the roof of the deposit, which is formed of true Coal shale, if either Dr. Gesner or his coadjutor W. will deign to visit my domicile, I will present each with a piece that will be found sufficiently hard to break the shallow craniums of those who doubt its existence and are willing to run their Quixotic heads against it, a circumstance which will enable them to find the floor; as, according to the laws of mechanized forces, falling bodies acquire an accelerated motion. With reference to the discovery of the Coal at Frederick Brook, I have never claimed it; portions of the Coal were indeed, brought to me by the late Mr. McRae, in 1835 and I then manufactured Gas from it, and will prove before a legal tribunal. The death of Mr. McRae prevented me from learning of the exact locality of the deposit, which the Messrs. Duffy afterwards rediscovered, in 1849 and when these persons, in the autumn of that year, brought the specimen of the Coal, I informed them of its 12 value for the purpose of making Gas. Soon after the Duffys had purchased their Crown lease, which was in 1849, a quantity of the Coal was sent from Albert to Messrs. Fellows, Druggists, King Street, and from these gentlemen I believe Mr. Peebles obtained a quantity, from which he then extracted Gas. As to Mr. Steadman's Coal, I believe this community will think that either Mr. Peebles or myself are quite as competent of distinguishing its character as they formerly considered Dr. Robb to be, when he exposed the imposture attempted by Dr. Gesner in endeavoring to palm off the jaw bone of a whale for that of a great fossil Saurian reptile found in the Oacknabog Lake. It will be observed that Dr. Gesner formerly employed a whale's jaw to astonish the natives - he now descends to smaller fry; his eulogist W., furnishes a less unwieldy weapon - the one that Sampson of old used against the Philistines. I need not refer to the small potatoe discovery at Prince Edward Island; this, no doubt, may be attributed to that native talent we are told has won for Dr. Gesner so very elevated a position amongst the scientific both of Europe and America, particularly where small potatoes are in request. To this high standard I assure W., I do not aspire. I hold the possession of this kind of honor in such ""supreme contempt"", that unless I caught them ""frustrating my plans,"" and endeavoring in defiance of all justice, honor, or honesty, to possess themselves of rights that belong to others, I would leave them to the quiet enjoyment of that complacency which originates from the authorship of so much twaddle. With the intention of enlightening those who are unacquainted with the circumstances that has led to the Asphaltum controversy, I attempt the following brief detail:- Dr. Gesner having, in 1841, received information of the existence of the Coal on Frederick Brook, that McRae had discovered, and that I had previously experimented with in 1835, proceeded, as our Provincial Geologist, to examine the locality, which he then pronounced a Coal Field, in which he stated he had found several strata of Coal, one nine feet thick. Encouraged by this statement, Messrs. Bryant and Shearer sunk a shaft at a place indicated expecting to find the nine foot bed of coal, but it was non est incentux. In 1849, the establishment of the Saint John Gas Company and its requirements, brought to my recollection my former experiments with the Coal from Frederick Brook, and early in the Spring of that year I mentioned the matter to Mr. Peebles, the Manager of the Works, when it was agreed that, as soon as time would permit, we should proceed together to Albert County and examine the locality of Frederick Brook. During the following Summer, however, and before we had carried out our intentions, the Messrs. Duffy re-discovered the outcrop of the Coal seam that Mr. McRae had described, and having purchased a Mining Lease from the Crown in 1849, they soon after commenced Mining operations, having the full consent of the owners of the soil, who received a small gratuity as damages for the entry into their wilderness land. Feeling that I had not profited by my previous knowledge of the existence of this Coal deposit as I ought to have done, I hastened to purchase leases on the East and South of the Duffy Mine, and these I procured in May, 1850. Towards the close of the year, the Messrs. Duffy, finding that they had not sufficient knowledge or capital for carrying on the Mining operations with advantage to themselves, and acting under the advice of the owners of the soil, they agreed to sell their lease to Messrs. Cairns and Allison for a certain sum. While the necessary documents for the transfer of the lease were being made out, S. Binney, Esq., acting as Dr. Gesner's agent, to my knowledge, endeavored to dissuade John Duffy from completing his agreement made with Mr. Cairns for the sale, by offering him a larger sum for the Mining Right than he had sold for; and Binney succeeded, by carrying Duffy to the country, in deferring the transfer of the Lease for a few days. Dr. Gesner being foiled in his attempt to purchase Duffy's Crown lease even at the enormous advance he offered on the stated price, was again obliged to have recourse to his native talent. He was no doubt about this time made aware by the publication of Professor Johnston's Report, of the high estimation that he was held in by Dr. Robb, who characterizes his valuable reports as vague assertions, ""where enough is said to excite the imagination but not to satisfy reason."" Dr. Robb, in October, 1849, visited Frederick Brook, and having searched in vain for the Gesner nine feet stratum of coal, was shown by Mr. Steeves what had been regarded as coal, but (to him) it proves to be Mineral Pitch or hard Bitumen. Although Dr. Robb does not say how or in what way he proved the substance to be Asphaltum. Dr. Gesner, for the first time, now adopts Dr. Robb's views, and that in the face of all his former printed statements respecting this locality being a coal field, and containing various separate strata of coal. He does this in order to be able to seize on a Mineral that he thinks is not reserved by the Crown - he calls this coal Asphaltum, and by insiduously obtaining a lease of four acres of land surrounding the mine from the owners of the soil, endeavours to possess himself of all the valuable works, mines, extracted coal, &c. there located - Oh! The modesty, the native talent!!! Being driven off and ejected from the mine, the Doctor now applies for an Injunction in Chancery to stop the working of the mine. The Master of the Rolls having given the matter due consideration, and finding that Gesner and his agents 14 knew that the mines were in possession of parties having a Crown lease to work them, and that they got this possession under the sanction of the parties owning the soil when they took their lease. Again, His Ho or the Master of the Rolls questioned whether the matter that was contended to be Asphaltum was not a substance sufficiently homogenous and of a nature to be classed under the list of substances reserved by the Crown, and known under the general name of Coal. He therefore would not interpose and stop the working of the mine. Viewing the grounds urged insufficient for the authorizing of such a request, he refused to grant an Injunction. Since this decision has been given a careful Geological Survey of the locality of Frederick Brook has been made by Dr. C.T. Jackson, of Boston, a gentleman of High European and American reputation both as a Geologist and Chemist. I have attended this gentleman in his late laborious researches, and I have much pleasure in announcing that he proves the mines of Hillsborough to exist in a Coal Basin, the margins of which has been distinctly traced. The animal and fossil vegetable remains found, prove most incontestibly the true Geological position of this deposit, and remove all doubt as to the character of the Coal formation. This places those that from a too hasty examination of the locality, or who from a strong bias in favour of an expressed opinion, in rather an awkward position regarding their geological acumen. When at Hillsborough lately I heard that a learned Professor had made a great discovery, proving the matter to be Asphaltum and soluble coal tar. On further enquiry I found the Mr. John Edgett had in the presence of Dr. Gesner, Dr. Robb and Mr. R.C. Taylor thickened boiling Coal Tar pitch with fine grained coal dust from the Frederick Brook mine. Wonderful! I beg to inform the learned experimenters that Bituminous Grand Lake coal dust may thus be used with equal success. It is amusing to see the amount of ingenuity expended in endeavouring to metamorphose this coal into Asphaltum; but it is highly discreditable in Dr. Gesner to send to Boston to Dr. Jackson as a specimen of the Hillsborough Mineral, a lump of soft maltha taken from Mr. Ayre's land situated twelve miles distant from the mines, and in another County. I procured a mining lease from the Crown of the locality in Westmorland, where this

Codes: J8 / IDX_Names: Albert Mines;

Weekly Observer - Oct. 7, 1851 For The Observer. Hillsborough Coal Versus Asphaltum. Mr. Editor. - A friend has just put into my hands the Halifax British Colonist of the 6th September, in which I perceive there is a letter addressed to the Halifax Gas Company, signed Abraham Gesner, which contains a tissue of mis-statements and false imputations respecting myself, which I hasten to contradict; and I hope your love of justice and fair play will give me a place in your columns, so that I may be allowed the opportunity, through your medium, of removing the false impressions that Dr. Gesner has been endeavoring to instill into the public mind, by means of publications devoid of truth, and which are calculated to mislead the judgement, appealing as they do to the sympathies by means of cunningly devised fables. Doctor Gesner states that I addressed, on the 15th July, an important letter to the Hon. J.E. Fairbanks, classing him with coal-heavers. This is a false and scandalous statement. I have never classed Mr. Fairbanks with coal heavers. It is true that Hon. gentleman, in his communication published in the ""Guardian"", July 18th, backed up his opinion then stated regarding the Hillsborough mineral, by the estimation in which he thought it would be viewed by a jury of coal-heavers. My statement was that, ""In making that remark I thought he had shown a want of delicacy."" Doctor Gesner's assertion regarding the classification, is untrue, and, if I may borrow the epithet he has suggested, I should say he is a shallow sumph that could imagine that such a reflection could be thrown on his friend. The assertion is wholly gratuitous, that my letter to the Hon. J.E. Fairbanks was impudent. I did not intend that it should be so - I do not think it was. Dr. Gesner, so far forgot my self-respect, as to endeavour to traduce that respectability which I cannot conciliate, or by impudence, falsehood and intimidation, try to bolster up a position that cannot be maintained with honour and honesty. I am again designated the employed scribble, oadjutor and advocate of the Halifax Gas Company, notwithstanding that I have with truth asserted on a former occasion that the gentlemen who compose that respectable Association are quite unknown to me, except by reputation; and that I had no communication with them directly or indirectly. I may now say, that I hold the man who will reiterate these falsehoods, without offering the shadow of a proof for his assertions, to be a baso and contemptible calumniator. I can assure him, that his puny attempts to traduce may excite but can never intimidate so as to prevent my exertions in exposing the ignorance of a pretending charlatan, whose impertinence is only equalled by his presumption, and his assumed scientific knowledge, by his unblushing effrontery and disregard for the truth. Dr. Gesner, to answer his purpose, has given a false quotation from what he terms my disgraceful letter to Mr. Fairbanks; he makes me state, ""I used the Hillsborough Bitumen for the production of illuminating gas long before Dr. Gesner came to this Province."" My expression was that I had used the Hillsborough Bitumen, &c. The term bitumen was employed in accordance with Doctor Gesner's recent name for the mineral which he had formerly designated Coal, and my doing so, I am glad to find, relieved him from a portion of his spleen, for he goes on to state, ""It is well enough that he has come over to bitumen, and had he not made solemn declaration that it was Coal, his testimony in the cause of truth might have had some weight. This coal of April is Pitch-Coal in June and bitumen in July."" Alas! how shallow in this little artifice - this attempt to discolour a simple statement, and make it appear to those who have only read my communication through Dr. Gesner's garbled quotations that my assertions are contradictory in themselves. My statement in April was that the substance is a mineral Coal, but even supposing it to be Asphaltum (which it is not), I had extracted Gas from it many years ago. I published the certificates of Drs. Chilton, Silliman, Torrey, Renwick and Booth, who all agreed in pronouncing the mineral a highly bituminous variety of Coal. And as Dr. Gesner had decided that this substance was a mineral, I referred him to that eminent chemist, Dr. Ure, of London, who had pronounced the matter in question to be ""Pitch Coal"", a true mineral of the Geological coal formation, and therefore in every sense of the term, popular, scientific and legal, a truly mineral production or substance."" I also published the following quotation from Taylor's Statistics of Coal, p. ix - ""So closely does some bituminized coals approach to the mineral bitumens, some of which have even been denominated coal."" It is evident that I must have then, as now, considered the Illuminating Gas given out by distillation from Coal, a product arising from the decomposition of the bitumen it contained. That I considered it so in April, so in June and in July, when I wrote what Dr. Gesner terms my disgraceful letter. I was correct, taking this view of the subject, in stating that I had used the Hillsborough bitumen for the production of gas many years ago. And notwithstanding all that Dr. Gesner has written in his supplements, I hold to the same opinion in October that I published in April, viz: - ""That bitumen united to charcoal in various proportions, constitute the numerous varieties of pit coal,"" and I now assert that coal destitute of bitumen will not produce an illuminating gas, consequently bitumen has been used for the production of light since the first introduction of coal gas to the public. So I conceive Dr. Gesner's attempt to assume to be the discoverer of the use of bitumen in the manufacture of gas, as most absurd - an ignus faluus that could only be lighted up in a mind disordered by the promptings of avarice and egotism. The next false quotation that I notice, is given by Dr. Gesner from my 1st of April letter, which he seems to mark as an ""appropriate day"" to answer a fool according to his folly - but let that pass, - He says that I stated that ""the bitumen of Hillsborough will not dissolve,"" &c. Now, my statement reads thus - ""On the mineral from Frederick's Brook, turpentine and fixed oils, like naptha, had little or no action, and it therefore will not make a varnish, as Gesner states."" I knew well that had it been that kind of hard bitumen, named Asphaltum, it would have dissolved readily in these solvents, without heat, as they may be regarded as tests for bitumen when uncombined with other substances; but when bitumens enter into combination with a certain amount of carbon, so as to form what is popularly termed Coal, then the bitumen so combined is rendered less soluble in these fluids, and the solubility is modified according to the combining quantities of the charcoal and the bitumen, and the mineral structure of the substance. - And as the mineral Coal of Hillsborough yields nearly the same amount of charcoal that the best cannel coal does, the reason of its difficult solubility is apparent. Let me refer to the following comparison as a proof:- 100 parts of Cannel Coal yields 10 of Coke. - Thomson, Chem. 2 v., p.375. 100 parts Hillsborough Coal yields 40.86 - Chilton. Thus we see that the quantity of carbon yielded is alike in Scotch Cannel and Albert Coal; but if we compare Kirwan's instructive analysis of Coal and Asphalt, we will see that as bitumen predominates, an easy explanation of the solubility of the latter. I construct the following from Kirwan's analysis of Coal:- Charcoal Bitumen Anthracite 97.3 0 Comp. Cannel Coal 75.2 24.63 here the carbon predominates by 53.52 Newcastle 53 40 "" "" 18 Scotch Cannel 47.62 35.52 "" "" 15.4 Asphalt 31 68 here bit'n pred. 37 Many eminent chemists of England have confirmed my statement regarding the minute portion of the mineral that is soluble in naptha and in turpentine, even when heated. Dr. Gesner, however, tries to disprove this by a note from Mr. Rice, a manufacturer of mineral paints, in Philadelphia, who says he found it easily soluble in naptha and turpentine, at a heat of 230ø F. If that gentleman has an apparatus of such strength that he can subject so very volatile a substance as naptha to that temperature, he may have succeeded; but as Mr. Booth, of Philadelphia, and Dr. Chilton, of New York, could only dissolve a small portion of the mineral by the action of boiling turpentine, I suspect that the mineral sent to Mr. Rice came from the same locality in Westmorland whence the specimen was taken that was forwarded to Dr. Jackson, in Boston, and which, with a shameful duplicity, was endeavored to be passed off for the Hillsborough mineral. I am glad to learn, however, that Mr. Rice wishes to contract for a quantity of the mineral. I shall be most happy to supply him from a quarter where the Doctor cannot, under any pretense, seize by action either of replevy or trover. Dr. Gesner gives a garbled quotation from what he is pleased to call my placard, when he says - ""Mr. Foulis states, that with reference to the Coal at Frederick Brook, he has never claimed it."" - Now, my statement was - ""With reference to the discovery of the Coal at Frederick Brook, I have never claimed it."" As purchaser of several Mining leases on Frederick Brook, I do claim all the mines and minerals within the bounds of my license. - The Doctor's dishonest intention, in giving such a mis-statement, is obvious, and needs no comment. Doctor Gesner asks the Directors of the Gas Company whether I made the Gas from Coal or the Bitumen of Hillsborough, and adds - ""If he say Coal, then his pretensions to patent claims are unfounded; if he say Bitumen, then the material is mine."" Now, I never set up claims regarding the exclusive use of the mineral in question, well knowing that no such claim will be available where there is no discovery. Illuminating Gas, as I have already proved, has been produced by the decomposition of Bitumen since the first introduction of Gas light from Coal. The Doctor's assertion that the Bitumen is his, is truly ridiculous; it only goes to show his convenient way of estimating the difference between meum et tuam. I have already shown that Asphaltum has been used many years ago on the Continent of Europe for Gas Illumination, so the discovery spoken of is another mare's nest - a kind of curiosity, of which Dr. Gesner made a very large collection while he was our Provincial Geologist. He accuses me of dissimulation; he ought to know that I am incapable of using that artifice; that I speak and act with a rough sincerity; indeed, his reminiscence may recall some passages of our early acquaintance that ought to remind him that I have independence enough to express the indignation I feel, when egotism, presumption and arrogance meanly attempt to raise its own standard by sycophancy and detraction. The Doctor says that my assertion, ""the main seam at Frederick Brook runs parallel to the bordering strata,"" has been decided by Geologists who have since examined the mine, to be altogether unfounded and untrue. The geologists referred to are Dr. C.T. Jackson, Dr. Robb, Mr. R.C. Taylor and Dr. Percival. As the last two mentioned gentlemen were examined on oath at Dorchester, let us see from the statements they then gave, who has made an assertion altogether unfounded and untrue. Mr. R.C. Taylor, in his deposition, said, ""The wall in some portions of the level approach to parallellism."" And he states, ""I discovered, in some instances, that the walls behind the horses were parallel with the Coal bed."" So, there, the Doctor's hired Geologist, although he holds to the opinion that the Coal is Asphaltum, does not give a statement that makes my assertion altogether unfounded and untrue. What is Dr. Percival's statement on oath? It is this - ""The first appearance on entering the Mine, is that of a highly inclined bed with parallel walls."" ""In the Albert Mine, the seams of the Coal correspond to the surrounding walls."" Here, again, this Geologist does not decide against me. Let me now refer to the statement given by that eminent Geologist, Dr. C.T. Jackson, to the July meeting of the Boston Society of Natural History. ""Having examined the Mine, he had ascertained that the deposit is in reality parallel to the adjoining strata."" I trust these extracts from the statements of three of the four Geologists who examined the Mine, afford sufficient proof that my assertion regarding the parallelism, was not altogether unfounded, and the untruth rests with the Doctor, who has falsely stated the decision of the Geologists; and the effrontery with which he makes such statements, exhibits one of the ""modes of deception that he keeps in practice on the public."" The next false statement that I notice, is with reference to a Mining right in Westmorland. The Doctor says - ""Having obtained the right of the owners of the land for some valuable mining property, I afterwards discovered that Mr. Foulis laid claim to the same for his daughter, under a mining license. The inhabitants are not disposed to submit to such outrageous demands upon their rights - Mr. Foulis has been ordered off."" Now this statement contains two palpable falsehoods; the first, that after he had obtained the mining rights he discovered my claim; the second, that I have been ordered off. Doctor Gesner obtained by purchase from the Crown, through his Agent, S. Binney, Esq., a mining right, bounded on my previously purchased mining lot, and, as he asked for this boundary, he must have discovered my claim before the period that he states. Finding that his agent could not induce me to enter into any copartnership transaction that would allow him a mining privilege within the bounds of the right I had purchased, he has since, I believe, through his agents, endeavoured to obtain rights to mine from some of the owners of the land. Although I have been invited by some of the owners of the soil in this locality to commence mining operations, I have hitherto preferred to await the decision of the Judges on the case of the Crown Reserves at Queen's County. So, as I have not as yet been on, I could not have been ordered off. Dr. Gesner, by a strange inconsistency, wishes to make it appear that he is the advocate of the Farmer's rights. He forgets that he claimed being the first person who applied to Government for permission to work the mineral deposits. He says nothing of holding, through agents, mining Crown leases, and the infringement on the Farmer's rights which must follow operations on them. He forgets also that he has acknowledged that so great was his anxiety to obtain the Duffy Crown lease, that he dispatched his son from New York to purchase it, and failing to accomplish this, when he learned that Mr. Allison had concluded an arrangement for the purchase of it for œ3,500, he sent his agent post haste to this City, who endeavoured to prevent the completion of the transfer by Duffy, by an offer of œ5,500 for the Crown lease. To add to the ungentlemanlyness of their transaction, Duffy was kept in a state of inebriety, and to prevent him from signing the transfer, he was taken out of the city and kept for some days. But, to his credit be it spoken, when sober, returning reason brought rational reflection, the influences of honour prevailed, and again brought him to this City to accomplish his agreement. I mention these facts to show that Dr. Gesner's sympathy for Farmer's rights originated with his inability to procure the Crown lease that the Duffy's held. Failing to obtain Duffy's mining privilege, Dr. Gesner procured, in the most unhandsome way, a lease of four acres of land surrounding the mine from the owners of the soil. The parties well knowing that Mr. Allison was in peaceable possession, under the sanction of the grantee, and that he was willing to pay any legal demand they could urge. Thus does Dr. Gesner, on that most ungentlemanly interference, now rest his claims, and lost to that sense of honour which fears public scorn, he comes before the tribunals of justice to require that low legal trickery should usurp the jurisdiction of an honest jurisprudence. With regard to the Reserved Crown Mineral Rights, a high tribunal will decide. If the Crown has no such rights, the government ought not to deceive individuals who are willing to risk large sums in developing the mineral resources of the Province. If the right is vested in the Crown, then such provision should be made as would secure to the owner of the soil an ample recompense for any damage that may arise from mining operations. It is amusing to hear the Doctor's cry of ""No Monopoly!"" at the very moment when he is endeavouring to obtain one of the greatest monopolies ever asked for - the sole use of a mineral so universally known, for a purpose so universally required. The Doctor, towards the end of his letter, attempts to be facetious at my expense, but his gambol is clumsy, like that of a grizzly bear learning to dance. To show that he is not a dolt in literature, as proclaimed by the ""Chronicle,"" he furnishes a Latin quotation for an Asphaltum medal that he proposes should be awarded to me. In return Weekly Observer - Sep. 9, 1851 From the Boston Traveller. Boston Society of Natural History. - First August Meeting. - Dr. C.T. Jackson, Vice president, in the Chair. Mr. Teschemacher read a communication on the traces of vegetation in Coal. He applied his observations to prove that the new coal, from Hillsborough, N.B., belongs to the true coal formation, comparing the specimens with each other. Mr. Bouve remarked that since the publication of the ""Vestiges of Creation"" facts had come to light decidedly opposed to the theory of transmutation of species on which that work was based. in a similar way it would seem that the theory of the progressive development of species, was destined to be modified, if not overturned. As an illustration, he offered for theexamination of the Society a number of specimens of fossil palms or palm-like plants, from shales underlying the Pennsylvanian Coal. The shales were immediately over a conglomerate containing no coal in that locality, the conglomerate lying next above the old red sandstone. - Mr. Bouve presented the specimens, together with specimens of Fucoides, &c. Mr. Teschemacher, after examining the specimens, said that some of them presented characters resembling those of the Ferns; others however, he considered as undoubtedly Palms. He regarded the discovery a very interesting and important one. Dr. Jackson stated that he had made elementary, or so called organic analyses, of the coals, before and after separating the soluble bituminous portions, and had found that it was impossible to distinguish coals from bitumens by ultimate analysis, for the hydrocarbons are often isometric, though differing from each other in physical characters and chemical properties. Dr. J.L. Smith, on being requested by Dr. Jackson to give his views on the subject of coals, as he had made hem a special study, proceeded to address the Society quite at length. He had himself given particular attention to the study of Lignite. He noticed the characters of the various kinds of coal known to commerce, and in speaking of the recently discovered coal of Hillsborough, about the real character of which there had been of late so much discussion, he said that it approaches much nearer to true coal in its properties than lignite, which is now admitted by Geologists as a genuine coal."

Novascotian - Sep. 15, 1851 Report on the Asphaltum Mines of Hillsboro', New Brunswick, with a map has recently been published at Philadelphia. It is Prof. Taylor of that City, and Dr. Robb of Fredericton. The work is well executed and contains much interesting matter."

Royal Gazette - Apr. 14, 1852 Passed April 7, 1852: An Act to Incorporate the Albert Mining Company."

N.B. Reporter - Aug. 6, 1852 Important trial in Albert County. - The Mining Case Settled. - A telegraph despatch was received yesterday from Hopewell, Albert County, stating that the important trial relative to the Mining Leases in this County between Edward Allison, and Wm. Cairns, Esquires, Defendants, and Dr. Gesner of Nova Scotia, and others, Complainants, has at length been decided in favor of the Defendants. The Court opened on the 20th July, His Honor Judge Wilmot presiding, and the case occupied fourteen days during the whole of which time the greatest patience and attention was manifested by the Jury, which, we believe, was specially summoned for the trial, and consisted of some of the most intelligent men to be found in the Country. - New Brunswicker."

Codes: J8 / IDX_Names: Albert Mines;

N.B. Courier - Aug. 7, 1852 Albert County. - There has been quite an excitement in this County during the last two or three week, on account of a very important law suit which has been tried before the Supreme Court recently in session at Hopewell, and presided over by His Honour Judge Wilmot. The case to which we allude was an action of trespass brought against Wm. Cairns, Esq., by Dr. Gesner. Mr. Cairns is associated with Edward Allison, Esq., of this City, and other capitalists in the United States, as partners in the Albert Coal Mining Company, who purchased from the Messrs. Duffy at a heavy expense, certain Government leases to mine gold, silver, coals and other minerals in the County of Albert, and under these leases, after extensive preparations, extracted large quantities of a substance supposed by them to be coal. Dr. Gesner and others however, failing in their effort to secure these same mining leases, purchased the land itself from the owners, and on the ground that the substance was neither gold, silver nor coal, but asphaltum, attempted 5 to prevent the Albert Coal Mining Company from carrying on their operations. The whole question, therefore, resolved itself into this, whether was the substance extracted coal or asphaltum. As there were several other suits depending upon this question, it was arranged that they should be decided by the result of the first one, which was opened by Albert Smith, Esq., on the part of the plaintiff, on the morning of the 20th ult., and brought to a conclusion on the evening of the 3d. inst., by the Jury unanimously giving in a verdict for the Defendant, Mr. Cairns - the trial occupying thirteen days. The jury was a special one, and carefully selected; and from the fact that they only retired for ten minutes after the judge had summed up, we may presume that they had not much difficulty in coming to the conclusions they did. The evidence on both sides was very voluminous, and principally of a Geological and Chemical nature. It was thought by some that the Jury would have given in a verdict for the defendant at the conclusion of the evidence on behalf of the plaintiff, but the Mining Company were anxious to produce such an amount of incontestable evidence from scientific men of eminence in the United States, as would finally set the matter at rest; amongst their witnesses were Professor Silliman, Drs. Percival, Hayes, Jackson, Torrey, Ellet and Deck; Messrs. Teschmacher and Peebles were also examined on behalf of the defendants. On behalf of the plaintiffs, Dr. Robb, of Fredericton, Drs. Wetherall, Liddy, Antisell, and Professor Taylor. From what we could learn of the particulars of this case from the commencement, we are much gratified at the result of the trial in this instance, as we have all along had but one opinion in the matter, viz: that Messrs. Allison, Cairns, and their copartners were the real and bona fide proprietors of these mining leases, and that under these leases they were entitled to extract the substance in dispute. D.S. Kerr, Albert J. Smith, and C. Milner, Esquires, conducted the case for the Plaintiff; and for the Defendant, the Hon. J.A. Street, Attorney General, Hon. J.H. Gray, J.M. Johnson, Esq., of Miramichi, A.C. Palmer, Esq., of Dorchester, and Bliss Botsford, Esq. of Moncton."

Miramichi Gleaner - Aug. 9, 1852 County of Albert. - The important Mining Suit has been decided in favour of Messrs. Allison, Cairns &c., the parties now in possession of the Mine. The jury have pronounced the article Coal."

N.B. Courier - Dec. 10, 1852 Albert Mining Company. - On Tuesday last, his Honour the Master of the Rolls delivered judgement and granted an injunction at the instance of the Albert Mining Company, against Eugene LeGal and others, which will have the effect to restrain any further prosecution against the Company; so that their operations may be carried on without further annoyance. The Hon. John H. Gray, Q.C., the Hon. Attorney General, and James W. Chandler, Q.C., argued the case of the Albert Mining Company; and Hon. R.L. Hazen, Q.C., W.J. Ritchie, and D.S. Kerr, Esquires, for LeGal and others. - Chronicle"

N.B. Reporter - Dec. 14, 1852 In the case of trespass, Gesner versus Cairnsand others, that has excited so much interest and was tried at Hillsboro', New Brunswick, in August last, a verdict was given for the defendant but the court upon the consideration of various points have granted a rule misi to set that verdict aside for a new trial. - Nova Scotian."

Royal Gazette - Dec. 15, 1852 Albert Mining Company. Notice is hereby given, That the first Meeting of the Albert Mining Company incorporated under Act of Assembly, 16th Victoria, Chapter 87, will be held at Hillsborough, in the County of Albert, at the House of William Cairns, Esquire, at 11 a.m. Thursday the 6th day of January next, for the organization of the said Company, and for determining by a majority of the members present at such Meeting, their acceptance of the Charter of Incorporation as provided in and by the second Section of the Act; of which all Members of the Company will take notice and govern themselves accordingly. - Dated eighth December, A.D. 1852 Edward Allison Member of said Company. December 8, 1852"

Codes: J8 / IDX_Names: Albert Mines;
Miramichi Gleaner - Dec. 25, 1852 Sir Charles Leyll. - This distinguished geologist left New York last week in the steamer for England, accompanied by Lady Lyell. The object of this third visit of Sir Charles Lyell to America, was to deliver a second course of lectures at the Lowell Institute, Boston, and to examine some interesting localities in the north-eastern portion of America. It will be remembered, that Sir Charles and Lady Lyell were fellow passengers from England last summer, with Sir Edmund and Lady Head. On landing at Halifax, Lady Lyell accompanied our Lieutenant Governor and his lady, to Fredericton, while Sir Charles made a geological tour in Nova Scotia and this Province. From Halifax, he first proceeded to the coal mines at the South Joggins in Cumberland, for the purpose of making a close examination of the remarkably perfect coast section at that place, with the view of determining some important points in relation to the mode of formation of coal, and the fossil vegetation of the carboniferous period, upon which some difference of opinion has arisen among men of science. At the Joggins, Sir Charles spent four days, during which he was enabled to collect many new facts, eminently calculated to advance the progress of geological knowledge, and extend the reputation of these Provinces, as an increasing field for scientific enquiry. The discovery of several fossil trees and vegetables at the Joggins, will not be among the least curious of the new facts to be presented with reference to that locality. From the Joggins, Sir Charles proceeded to themines at Hillsborough on the Petitcodiac, solely however for scientific purposes, and without any intention of entering into the points in litigation between the parties interested in that valuable deposit. Thence he proceeded to Fredericton, and passing this City with Lady Lyell, went to Boston in the 'Admiral.' In his lectures before the Lowell Institute, Sir Charles has taken occasion, frequently, to make favorable mention of the mineral wealth of New Brunswick and Nova Scotia. ..."

Codes: J8 / IDX_Names: Albert Mines;
Weekly Observer - Feb. 3, 1852 Mining Leases. - Mr. Stiles presented from Edward Allison, Esquire, on behalf of the Albert Mining Company, setting forth a statement of difficulties and hardships under which the Company now labour, by reason of conflicting interests between land owners and mining leases, and praying Legislative regulations for relief thereof. The Hon. Member read the Petition at length; and moved that it be received and referred to a select committee to report thereon by Bill or otherwise. Petition received accordingly; and his Honor the Speaker proceeded to nominate Messrs, Harding, Montgomery and Barberie, as a select committee thereon. Mr. Botsford moved that the hon. Attorney General be added to the Committee; and thought, that in courtesy, the hon. mover of the Petition, Mr. Stiles should also be on it. Hon. Attorney General said, this was a very important Petition and was going to bring up a most important question. There was now a Bill before the House, which would go to invest the property in all mines and minerals in the Province in the owners of the soil. This petition prayed legislative action on the subject, as he conceived, for the purpose of enabling lessees and grantees of mines and mining privileges, to make arrangements with the owners of the soil to carry on their mining operations; and thereby to prevent the litigation which otherwise must inevitably ensue. At present, the owners of the soil had the right of preventing any persons from trespassing on their land; while the lessees or grantees of mining privileges had an undoubted right to the minerals in such land, but they had no right of entry on the land to get at them; and the continuance of such a state of things would destroy all the benefit of the mines and minerals in the country, and would wholly prevent the employment of enterprise and capital in developing them. It was a most important subject; and he therefore hoped the select committee would consist of at least seven members. Mr. Needham agreed with the hon. Attorney General; and hoped the Committee would be able to report a Bill that would give to the owners of the soil all that was above it and below it; that was the Bill that he would go for. The hon. Attorney General, Messrs. Montgomery,

Chapman, Botsford, Harding, Stiles and Lewis, were then named as the Committee. Hon. Mr. Wilmot said, he had in his hands a Petition from Mr. Berton of St. John, on a similar subject; and it was a question whether it should not be referred to the same committee, as he thought it involved the same principle. Mr. Cutler briefly urged that the matter should be provided for by some general enactment. Mr. Scoullar suggested, that as a Committee had already been raised on a somewhat similar petition, brought in by an hon. member for Queen's County, (Mr. Earle,) that a Committee might be enlarged, and the whole matter referred to it, instead of appointing a new one. Mr. Barberie thought the former Committee had better be discharged, and all the documents be referred to the Committee now just raised. Hon. Provincial Secretary thought it better not to appoint a new Committee at all, but to enlarge the original Committee; and in the mean time let this Petition lie on the table for information of Members. Mr. Earle thought, that if all these matters were referred to the same Committee, it should be enlarged to nine members. Hon. Attorney General suggested, that no hon. members interested in the question, should be on such a Committee. He believed some hon. members owned lands in which some of the mines in question were situated; and such members should not be on the Committee. There was one reason why he himself would rather object to being on the Committee; because he had been professionally engaged in one of those law suits at law. But there was a great difference in the nature of the Petitions in question. The Petition brought in by the Hon. member for Queen's, prayed for pecuniary compensation for damages sustained by the Petitioner, in defending his rights, as a land owner, in suits at law; but the present Petition prayed, that the Legislature should pass a bill to regulate the respective rights of the land owners and the mining lessees and grantees for the future. All mines and minerals and mining rights were the property of the Crown, and were always expressly reserved to the Crown in all grants of land. The judicial tribunals of the country, after having devoted a great deal of time and the most careful attention to the subject, had determined that such reservations and Crown rights were in full force, and that the Crown had never been divested of them; but they had also decided, that the right of entry on the lands granted was not in the Crown but in the grantees. Therefore, this Petition prayed that a law might be passed to define those respective rights, and thereby to prevent future litigation. The right of entry was not in the Crown; but the property in the mines and minerals was; therefore the licencee of any such mines, although he had paid a valuable consideration for such mining rights and property, could not enter upon granted lands to enjoy them. The object of the intended law was, to prevent such difficulty and injustice hereafter; by making some provision, to authorize the local Magistrates to summon a jury in all such cases, to assess the amount of damages which the mining licencee or grantee should pay to the owner of the soil, for a right of entry to work his mines. He believed that was what was contemplated by the present Petition; and if so, the purpose of this Petition was totally different from that brought in by the hon. member for Queen's. - The hon. Attorney General concluded, by explanation, that as he had been professionally employed in some of the litigations on this subject, it might probably be an objection to his serving on the select Committee. Mr. Earle thought the Attorney General seemed to cast his eye at him, (Mr. E.) when he spoke of hon. Members being interested in this question; but he assured the House that he was in no way whatever interested in the matter, further than every hon. member should be interested for the public good. Mr. Botsford made some remarks, corroborative of those of the hon. Attorney General, with respect to the distinction between the different Petitions; the one being for compensation for pecuniary losses in a particular case; and the present one being a general Petition, for a Legislative definition of the respective rights of parties. He did not see why a new Committee should not now be raised, as the subjects were so totally distinct. Mr. Needham thought there could be no impropriety in referring both to the same committee. Mr. Botsford replied, that if they did, they would lose the services of the Attorney General. Hon. Provincial Secretary said, that they could easily obviate that difficulty; there could be no objection to the names of any of the hon. members on the original Committee; and by merely adding the Hon. Attorney General and Mr. Botsford to that Committee, that would be sufficient. Then let them report distinctly on the first petition, and ask leave to make a further report; upon which they could proceed to the consideration of the present petition. He would therefore move accordingly. Mr. Needham seconded the motion. This motion was carried, and the petition accordingly referred to the original Committee, and the hon. Attorney General and Mr. Botsford added thereto. Mr. Botsford then moved, that Messrs. Harding and J.M. Johnson should be added to the Committee, making the total number nine; which being seconded, was also carried."

Codes: J8 / IDX_Names: Albert Mines;
N.B. Courier - Jul. 24, 1852 Albert County. - The Supreme Court for the County was opened at Hopewell, on Tuesday last, by His Honour Judge Wilmot. After the Grand Jury had chosen their foreman, and were sworn, it appeared that there was nothing to come before them, and they were accordingly relieved from further attendance. The learned judge took the opportunity of congratulating them, and the inhabitants of the County, on the prosperous condition of that section of the Province, and the pleasing fact that there was no case whatever on the criminal calendar at the present term. This state of affairs he attributed in great measure to the beneficial effects of temperance principles, which had been the means of promoting industry and comfort wherever they were carried out, instead of idleness, dissipation, and crime. ...The principal cases to be tried before the court were those connected with the Albert Coal Mining Company, in which Messrs. Allison, Davies, and others are concerned; and as they were likely to last for some weeks, Judge Wilmot had written to Judge Parker to open the Westmorland Court on Tuesday next. The point in dispute between the Coal Company and Dr. Gesner is, whether the substance extracted from the mine is Coal or Asphaltum; and a great amount of evidence, scientific and otherwise, will be brought forward on both sides. A number of Geologists and Chemists have already arrived in Albert, for the purpose of giving their testimony. The Jury has been most carefully selected, specially for these trials, and we learn that they are men of the most honest and respectable description. As the parties at present in possession have laid out a large amount of money, and are carrying on the work vigorously, and benefitting the country, we trust they will not sustain

any serious loss, whichever way the trial results. A railway, five miles long, from the mines to the wharf at Hillsborough, has been laid down, and coal waggons passed along it on Monday last for the first time. We believe this is the first railway in actual operation in this Province."

Weekly Observer - Jul. 27, 1852 and Novascotian - Aug. 2, 1852 Albert County. - The Supreme Court for this county was opened at Hopewell, on Tuesday last, by his Honor Judge Wilmot. The principal cases to be tried before the court,were those connected with the Albert Coal Mining Company, in which Messrs. Allison, Davies, and others are concerned; and as they likely to last for some weeks, Judge Wilmot has written to Judge Parker to open the Westmorland Court on Tuesday next. The point in dispute between the Coal Company and Dr. Gesner is, whether the substance extracted from the mine is Coal or Asphaltum; and a great amount of , scientific and otherwise, will be brought forward on both sides. A number of Geologists and Chemists have already arrived in Albert, for the purpose of giving their testimony. The Jury has been most carefully selected, specially for these trials, and we learn that they are men of the most honest and respectable

Miramichi Gleaner - Jun. 21, 1852 The Albert Coal. - Having my imagination highly excited by seeing a description of the Albert coal and its valuable addition to gas manufacture, I became possessed with a strong disposition to visit the locality of the mines and satisfy my curiosity, at the same time glean a little information as to its position and general appearance, not knowing but what it might be some advantage that coal fields to an unbounded extent repose beneath its soil. On arriving at the Bend of Petitcodiac, I fortunately was introduced to Dr. Cowie, who very kindly offered tp drive me to the mines. On our journey we called at Alexander Wright's, Esq., Salisbury, (to obtain the necessary information) the appearance of whose residence as about the finest I observed about those parts. On arriving at the mines I became acquainted with Mr. Brown, the Captain of them, who took considerable trouble in pointing out to me any little peculiarity or marked feature which distinguished the formation, and also collecting and furnishing me with specimens of the coal, bituminous shale, and fossil remains, the latter not being very abundant. The only good specimens of which I obtained from one of the miners, to whom I am considerably indebted. After exploring the subterranean wonders of the place I returned, and on my way I called on Mr. Cairns, the Superintendant of the mines who lives about three or four miles distant from them. He very kindly showed me his gas apparatus by which he illuminates his house. Its arrangement is remarkably simple: - A small retort, receiver for condensible products and a gasometer, constitute its whole arrangement, and I am certain every house ere long will be illuminated with this beautiful gas. The cost will be quite insignificant in comparison with the old processes of illumination. On my return to Salisbury, Mr. Wright furnished me with Professor Johnston's Report on the nature of the coal, and also another pamphlet purporting to be a review of that report, written by an anonymous man of letters. I read them both, and found the latter publication not to agree at all with the other. I consequently came to the conclusion to experiment myself to ascertain which of the two was correct. If science is so unsatisfactory as not to establish the truth, the sooner its votaries relinquish the pursuit of such branches of knowledge the better. If the study of the well filled and diversified page of nature is to be blotted by one professing to be its reader and interpreter, how can the young scholastic eye attempt to decypher those records with any degree of certainty or precision. Where all ought to be harmony and beauty of arrangement, calculated to awaken a feeling of enjoyment and happiness, we find the most discordant and crude expressions made use of, evidently exhibiting a sordidness of purpose which is most deplorable, more so, proceeding as it does from one who ought to interpret but to instruct, and study but to impart that information so highly calculated to awaken a thirst for instruction both profitable and amusing. The author of the Review seems to labor very hard to identify the Hillsborough coal with asphaltum; and after exhausting all his own scientific fire in endeavoring to establish it, he appendixes his pamphlet with certificates, unscientific, discordant and unsatisfactory. I was highly amused with one written by P. Guimaren, M.D., of the Bend of Petitcodiac, who informs us that the coal ""melts and runs down through the grate and into the ashes"", certainly a very convenient place of repose, as its concealment would necessarily prevent the examining of its physical and chemical characteristics, the identifying of which might possibly occasion a greater amount of information than what the learned gentlemen is in possession of. However, I shall now detail the few experiments I have made on the two minerals. Experiment First. - I placed about twenty or thirty grains of asphaltum, coarsely powdered, and the same amount of the Albert coal upon an old daguerrotype plate, which had sufficient silver upon it to cover the copper, leaving about half an inch between the two. I then placed it over the blaze of a Berzelius spirit lamp. In a very short time the asphaltum melted and assumed a smooth rotund surface, and soon emitted gas and volatile products of a very fetid and disagreeable odour, and continued to do so till nothing but a dry black scale of carbonaceous matter remained, while the Albert coal continued without any alteration except exhibiting a slight crackling sound, similar to salt when thrown on the fire. After the combustion of the asphaltum, a permanent black stain remained, with a copper-colored belt surrounding it, and outside of that another belt of black color, while not the slightest stain or discoloration was discerned where the coal rested. If the coal had been asphaltum why did it not melt and stain the silver? I then put a piece of about the size of a bean of each, without breaking, upon an iron wire mesh, the squares of which were about the sixteenth part of an inch wide, and on bringing it over the flame of a spirit lamp the wire became red hot, and immediately the asphaltum melted and dropped through the net, and continued to do so till none whatever remained above the wire. While this was going on the coal softened on the lower part, slightly puffed a little on the lower side, inflamed, but none dropped through the wire. If the coal was asphaltum why did it not drop through the wire? Again, I took twenty grains of Hillsborough coal and boiled it in two drams of Naptha for two minutes, filtered it, boiled the residuum in three drams of sulphuric ether, after in absolute alcohol. It lost only three grains. I then put twenty grains in two drams of pure kresote, boiled, filtered and weighed the residuum, and found it had lost two grains. I then boiled Asphaltum in kresote, and afterwards in naptha. - Each completely dissolved it, forming a thick varnish resembling Barbadoes tar. On boiling twenty grains of Albert coal in three drams of spirits of Turpentine, filtering, drying and weighing that which was not dissolved, I found it had lost three and a half grains. Twenty grains of Asphaltum boiled in the same quantity of Turpentine, dissolved completely, forming a fine japan. If the Albert coal is asphaltum, why did it not completely dissolve in Turpentine, Kresote and Naptha? I then put 960 grains of the Hillsboro coal into a small retort, and subjected it to destructive distillation, and obtained 440 grains of pure coke, leaving 520 grains for the condensible and gaseous products. The former amounted to about four drams, and in its subtile, heavy, disagreeable odor, resembles caoutchoucine. On puting the same amount of asphaltum into the retort and treating it in a similar way, I obtained 120 grains of coke and 810 of condensible and gaseous products. The odor of the liquid products resembled naptha, while that of the gas was almost insupportable from its offensive and fetid nature. This odor I consider a distinguishing feature of asphaltum. I then took two drams of the liquid products obtained in the destructive distillation of the Albert coal, and put twenty grains of the coal into it, and boiled it, and after filtering, drying and weighing, I found the coal had lost seven grains, leaving thirteen grains undissolved. I subjected 20 grains of asphaltum, to the same treatment, and found it to dissolve completely without residue - fluid and this while hot, and when cold had the appearand consistence of tar. I did not pursue my investigation further, considering the above quite conclusive. The liquid products, I think, would furnish an interesting subject for chemical enquiry. Apart from any chemical examination there is sufficient in the appearance and physical character of the two bodies to distinguish them; for instance, if the Albert coal is finely pulverised it exhibits nearly a jet black, whereas asphaltum is a snuff brown color, and has a nauseous smell. I would remark that the amellated structure of the Hillsboro coal is sufficient to set aside the idea of its being asphaltum, having an excellent opportunity of inspecting it when in the mine. When there I detached a large piece with square sides, and straight lines parallel to the face of cleavage, while asphaltum has a more massive and continuous structure, and has not that clear glossy jet fracture which the coal presents. I have no doubt in saying that it has been produced by a decomposition of wood, free from metallic and inorganic substances at great depths and under peculiar chemical phenomena, aided by heat and great pressure from superimposed strata. The following statement fosters this idea. The tar furnished by the destructive distillation of cedar wood, when re-distilled, furnishes a residuum scarcely distinguishable from Albert coal. It slightly dissolves in sulphuric ether, naptha, and absolute alcohol, and yields a beautiful gas when subjected to a high heat in a retort, leaving a light friable coke, resembling the coke from the Hillsboro coal. When burned in the open air it leaves a beautiful fine ash of reddish color. I intend sending a sample on to Mr. Wright, as also the coke. I obtained it in the manufacture of cedar oil, that valuable remedy for toothache and rheumatism; and I conclude by saying that the Albert

Weekly Observer - Nov. 23, 1852 and N.B. Reporter, Page 2 - Friday, November 26, 1852 and Miramichi Gleaner - Nov. 29, 1852 and Nova Scotian - Dec. 6, 1852 Albert Mining Company. - The Act incorporating this Company has received the Royal assent, and is published at length in the last Gazette. The names of the parties incorporated are Edward Allison, Jonathan C. Allison, David Allison, Wm. Cairns, Alexander Wright, Nathanial Gould and James Dowie, their associates and successors. The capital of the Company is fixed at œ30,000, and their right to enter upon private property 7 is limited to a tract of wilderness land of one mile square, described in a mining lease to Peter Duffy and John Duffy. - New Br."

Weekly Observer - Sep. 7, 1852 Sir Charles Lyell, who honorably stands at the very head of modern Geologists, accompanied by Lady Lyell, also came out in the last steamer to Halifax. Lady Lyell arrived in this city on Friday, accompanied with Sir Edmund and Lady Head, and proceeded with them to Fredericton. Sir Charles is travelling by the land route from Halifax, with the object, it is stated, of visiting the rich and extensive Mines in Albert County, and his opinion as to their character and importance will be looked for with much interest. It is understood that Sir Charles and Lady Lyell intend visiting the United States and Canada."

N.B. Courier - Sep. 11, 1852 Sir Charles Lyell arrived in town yesterday, from Albert County. His Excellency Sir Edmund Head came down the day before, to await his arrival, and we believe they proceeded to Fredericton today. We understand that Sir Charles Lyell is of an ancient family in Forfarshire, Scotland, and is the proprietor of a large landed property there, named Kinordie. He commenced his geological pursuits, in which he has since attained such eminence, as Honorary Secretary to the Geological Society of London. He has a large private fortune, and although devoted to the science of Geology, does not occupy any collegiate situation."

Novascotian - Sep. 13, 1852 Sir Charles Lyell, the eminent geologist, is at present visiting Albert County, N.B. and other localities of the province. It is thought that Sir Charles' opinion will go far towards settling the disputed coal and asphaltum question. Sir Charles and Lady are on their way to the United States."

N.B. Reporter - Sep. 17, 1852 Sir Charles Lyell arrived in town on Friday, from Albert County, and proceeded to Fredericton on Saturday, in company with His Excellency Sir Edmund Head, to join Lady Lyell. - Obs."

Codes: J8 / IDX_Names: Albert Mines;
Miramichi Gleaner - Aug. 3, 1853 and Morning News - Jul. 27, 1853 County Albert Mines. - A portion of the Halifax papers contain a report of a trial between the Company now working the mine in the above named county and Dr. Gesner. After a protracted trial of ten days, the Judge charged in favor of the Plaintiff, and the Jury returned a verdict accordingly. As the

question at issue has created considerable interest throughout this section of the Province, we publish below a portion of the charge of His Honor Judge Bliss. I will now direct your attention to the main feature of this case presented for your decision. The question you have to decide, gentlemen, is, whether this article is coal or not. Whether it is a mineral, is a question with which you have nothing to do; and I was rather surprised at the learned Counsel engaging your attention so largely on that point, after I had distinctly stated that I would reserve it for the decision of a full Bench; and here I may take occasion to say that having given my opinion, as a Judge is often called upon to give on points of law which arise in the progress of different cases; yet I shall not be at all afraid or ashamed, to change that opinion, if upon mature reflection, and a full consideration of the principles bearing upon it, a different opinion would appear to be correct. With that enquiry, however, you gentlemen, having nothing to do. It is a question of law - not of fact. The simple point for you to determine is, whether this is coal or not? If it is not Coal it is Asphaltum. All the witnesses, it appears, agree on this, both on one side and the other. On the one side they assert that it is coal - on the other, that it is Asphaltum; but the evidence on both sides is conclusive that it must be one or other of these two substances. If it is not true coal, it will pass, as far as your decision is concerned, to Dr. Gesner, with the soil, of which he is the lessee. The point is a very singular one to be brought in a Court of Justice. I have known such incidental questions to arise frequently in medical and scientific jurisprudence; but never an instance exactly similar to this. Singular however, as this case is, it is not more singular than the testimony which has been given, from the lowest to the highest. We find a disagreement in the opinions of the practical men who knew little of the principles of science, and we find as marked a difference in the conclusions of the learned men who have been examined. I am sure you, gentlemen, participated with me in the pleasure which every body in court must have listened to the testimony of Professor Robb, and I need not add any eulogy of his talents, or his attainments in the branches of science to which he is attached. The College to which he belongs in New Brunswick, may well be proud of him as a professor. We saw him during an examination of a day and a half - throwing off his answers with clearness and perspecuity, and giving explanations on points we did not understand in a manner so lucid and intelligible that must have been in the highest degree very satisfactory. If we look at the evidence on the other side, we find that it will equally bear examination. One of the gentlemen who has been examined for the defence is a professor of considerable reputation in the state of New York, the other holds a position of no less eminence in Massachusetts. Their explanations were very minute, and given in so clear a manner as to be intelligible to the narrowest capacity. I cannot deny myself the pleasure of calling to your recollection a remark of Professor Ellet, complimentary to the testimony of Dr. Robb. When gentlemen of science, whose evidence is apparently conflicting, observe such courtesy towards each other, it is not only gratifying to those who listen to them, but the eulogy is surely reflected back upon him who would have bestowed it on another. Besides the testimony of these learned men we had the evidence of the Superintendants of the Gas Works in Halifax and St. John. Their evidence also appeared to me to be singularly explicit and clear. [Mr. Peebles is the St. John Superintendent]."

Codes: J8 / IDX_Names: Albert Mines;

Headquarters - Dec. 7, 1853 The following important decision of the Albert Mining Company case was pronounced by the Court of Chancery by His Honor the Master of the Rolls - The decision appears to us of far too much importance to be abridged, and we are much indebted for an opportunity of publishing the judgment of the Court as delivered:- December 6, 1853 Albert Mining Company vs. LeGal and Others. - There are two main questions involved in the discussions that have taken place on the motion made for an injunction in this cause. 1st. The question of title. 2d. The right to an injunction. The first, the question of title, cannot be settled on an interlocutory proceeding like the present, and the proper tribunal for its decision is a Court of Law. In order, however, to determine the question now before me, it is necessary to consider the nature of the titles under which the parties severally claim, and their respective positions in regard to the subject matter in dispute between them. The case has been very fully argued in a discussion extending throughout six days, many affidavits have been produced, and many authorities cited, but the question before me, in the view which I take of it, does not call for a particular reference to the cases adverted to. The affidavits shew the Plaintiffs to be in the actual possession of a mine claimed to have been purchased from Peter Duffy and John Duffy, and which nearly a year previous to the purchase of the Plaintiffs, or rather of certain individuals since incorporated by the name of the Albert Mining Company, had been first opened and worked by the Duffys, under a licence from the Crown, dated 7th January, 1850. Within the bounds of this licence the Plaintiffs, it appears, have carried on their operations, and have expended large sums of money and raised a large quantity of the mineral substance found therein, and in short, have worked the mine on a scale of considerable magnitude. The Defendants, some or one of them, claim to be the owners of the land under which the mine of the Plaintiffs and the carbonaceous seam wrought by them are deposited. They also claim to be the assignees of Foster Bryant, to whom a prior mining right, in many respects similar to that obtained by the two Duffys, had been on 10th August, 1841, granted by the Crown, covering, however, a much larger space, namely, an area of nine square miles, and comprehending within its limits the lesser area contained in the Duffys' licence. There is no dispute as to the ownership of the land. To this the Plaintiffs assert no right. It is not denied that the Defendants are lawfully in possession, except so far as the works carried on by the Plaintiffs may have trenched upon the surface of the soil. The point in dispute is as to the mines and minerals within the limits of the Duffy licence, and the first question is whether the Crown after the grant to Foster Bryant could rightfully under the circumstances under which it acted, confer upon the Duffys a valid title. It is contended that after the grant to Foster Bryant, however he might have failed or neglected to comply with its conditions, it was necessary that the Crown should proceed by inquest of office to establish the forfeiture, and until office found that, no grant of the nature of the letters patent to the Duffys could pass. It was further contended that it is indifferent whether these letters patent are considered as a lease or a licence only as the Crown had declared the breach of the conditions should be a forfeiture, and had provided a remedy by re-entry. The principle which has been appealed to on both sides is that where in the case of the subject an entry would be necessary there in the case of the Crown, there must be an inquest of office. This, then, may be regarded as the true criterion. On the other hand, it is contended that the failure on the part of Bryant to commence the effectual working within the time prescribed in the grant, namely, within two years from its date, rendered the right conferred on the grantee, in the language of the grant itself, ""utterly null and void in all respects"". Other questions of importance arise supposing this to be adjudged for the Defendants, on which the establishment of their right must depend. It appears that an action of trespass has been brought by the Defendant Gesner, which has been twice tried, but with an adverse result, verdicts having been found each time against him, in which, however, a motion for a new trial has been made, which yet remains undecided. Another action of trespass, an action of ejectment, and a seire facias to repeal the letters patent to the Duffys have been also brought; all of which are now pending. On the other hand, proceedings have been instituted on the part of the Crown to repeal the grant to Foster Bryant. By means of these proceedings all the questions in regard to title discussed before me are in actual course of adjudication, and it only remains for me, without authoritatively pronouncing on the questions, to consider the rights of the parties in the interim. The position of the Plaintiffs is this, that they are in full and undoubted possession derived from the previous possessors, who entered without objection from any quarter, and with the assent and concurrence of the under owner of the land, opened and worked the mine undisturbed during the time they remained owners. The title of the Defendant, Abraham Gesner, to the land, arose from the assignment of three several leases from Alexander to Charles Milner, two of these leases severally contained an express declaration that they were not to be held to extend to any mines and minerals reserved or expected in the original grants from the Crown. The third, dated 24th December, 1850, the last in point of date, is a demise of four acres of land, (under which the Plaintiffs mine is situated) to be used by the lessee only, however, as fully as the lessors were entitled to under the terms of the original grant of the Crown. Shortly after the Duffys had sold to Cairns, the Defendant, Abraham Gesner, set up a claim to the mines in Cairns' possession, not by virtue of any specific grant or licence, but as derived from the original grant of the land, the minerals in question being, as it was contended, not included within the exception of the grant, which exception all the three leases expressly or impliedly recognised. A Bill in Chancery having been filed, and an application for an injunction made and refused, the first action of trespass was commenced and that case was tried in the County of Albert in June, 1852. The reason for setting aside the verdict then obtained for the Defendant therein, was not the ground of the then Plaintiff, Gesner, having established a right to the minerals, on the contrary, the judgement of the Court decided that point in the negative. The second trial in the present year was attended with a similar result. By these proceedings it was fully determined that the owner of the land as such had no right to the minerals. But a new claimant now appears to the mines in the person of the Defendant, Eugene LeGal, making title under the licence to Foster Bryant. LeGal's right, whatever it may be, arose in June, 1852, and was recorded in January, 1853. Henry Gesner, who assigned to LeGal, states his own title (derived by sundrey mesne assignments) to have been obtained in September, 1851, and that in the spring following he commenced a shaft, and while acting for himself and LeGal sunk it about 100 feet, and raised a small quantity of mineral. This shaft was situated half a mile from the Plaintiff's mine, though within the Duffy licence, and was not interrupted. It proved, however, wholly unproductive, and was abandoned. On the first day of May last, a new shaft was commenced within forty yards of the Plaintiffs works, and within their limits, which has been sunk to a depth of 160 feet. This was begun after notice that the land would be required under the 15 Vic., c. 87. It is to restrain the further prosecution of this work, and from the erection of a dam supposed to be contemplated by the Defendants from digging and carrying away the mineral within the Duffy licence that this application has been made. It is alleged that this shaft has become the cause of injury to the Plaintiff's works, the water accumulating therein and flowing their mine. This is altogether denied by the Defendants, who ascribe the injury complained of to the Plaintiffs' own want of skill. I will first consider the right of the Plaintiffs to protection in regard to the mineral substances, and secondly, the special damage complained of or anticipated. 1st. In regard to the minerals. The defendants derive no additional or stronger 8right from being or acting with the permission of the owners of the land. The two tiles, viz., to the land and to the minerals are entirely separate and distinct, and though the subject matter of each lies in juxta position with the other, yet in point of title they cannot be so wedded together as to present one subject of consideration, but must be regarded as completely separate. As owners of the land the Defendants, as it has been established, have no right except to the land, and the right claimed under the Foster Bryant licence is as opposite to that of the land owners, as that derived under the Duffys. The claim which the Defendants now assert came to LeGal long after the Duffys had entered, worked, and peacefully enjoyed their mine, and after Cairns had purchased and possessed under him. It is to be remembered that Henry Gesner was perfectly cognisant of the Duffys' rights and possession, having himself made them a conditional offer for them, and that Stephen Binney, the Defendant Gesner's agent, had also made great exertions to purchase from them. Henry Gesner had been employed by LeGal, who is associated with Abraham Gesner in certain works for which the mineral raised was required. Binney was also the agent of LeGal, as well as Abraham Gesner, prior to LeGal's purchase of the Bryant right. Both LeGal and Abraham Gesner must be taken then to have been fully cognisant of the right claimed and in actual exercise under the Duffy licence. In purchasing, therefore, an unexercised right (for there had been no effectual proceeding whatever under Foster Bryant's licence, at a period so long after, by the terms of it, it was forfeitable, if not actually forfeited) the Defendant LeGal has obviously purchased a lawsuit and entered on a speculation on the strength of a title having no support from possession. Forfeitable, I say, because it is impossible to maintain on facts as before me, however, this may hereafter turn out, that the right was not subject to forfeiture for non use at the expiration of two years, and if so, it is not attempted to be shown that the Crown had waived the forfeiture previous to the grant to the Duffys, whether right or wrong in making the grant without an inquest. - Though the court is, as has been truly said by the learned counsel for the Defendant, particularly cautious of interfering by injunction with mining operations, yet it is so where its intervention is sought to restrain operations in course of effectual progress. - To avert the future working of a mine, where large sums have been expended, and parties are in actual possession, must be attended frequently with ruinous consequences, but the circumstances in those cases more resemble those of the Plaintiffs than of the Defendants. On the other hand, it will in many cases protect an actual possession, when coupled with a prima facie title until a better right 9 shall be lawfully established. Whatever expense the Defendants may have been at has been incurred under circumstances which negative any supposition that the removal of the minerals within the Duffy licence would be acquiesced in by the Plaintiffs. I am therefore of the opinion that the Defendants ought not to be permitted to infringe upon the minerals within the Plaintiffs' lands, unless their title shall be first established at law, the injury being of that nature which involves irreparable destruction. 2d. As to the immediate greivance of which the Plaintiffs complain, the affidavits leave it very doubtful whether the flowage of their works has been the result of the Defendant's acts, or whether it is not in a great measure attributable to the nature of their own operations, but were the case much clearer than it is, I should hesitate to restrain acts not wantonly or designedly mischievous, which are properly referable to the right of the land owners (namely, digging within their own property to any extent short of the mineral deposit) and not to that claimed under the Bryant licence. This may in effect be very immaterial, as if the Defendants are debarred from obtaining the minerals, their object is for the time defeated. But however this may be, an important principle is involved. It appears that when the Duffys took possession it was under permission of the then owner of the land, who had a perfect right to give or withhold it, and the occupation of the land so far as was necessary was justifiable. But it is clear that Cairns acquired no such privilege, although exertions were made for that purpose, and the covenant of the Duffys to use their influence to procure it for him, shows at once his sense of its importance, and that he had failed to obtain it. In purchasing the mining right then he did it with the knowledge that he and acquired no right from the owner to occupy and encumber the land, notwithstanding which he has used their property without hesitation to suit his own convenience. It is true that the question is pending at law, and a jury contrary to what the Court considered the evidence warranted found for the Defendant in that case, yet that verdict has not yet been established, and as the Plaintiffs come here during the pendency of this suit for equitable assistance, their own conduct, or that of their agent towards the land owner is necessarily subjected to scrutiny, and becomes an important element of consideration, in order to determine their title to the aid of the Court. However embarrassing to them, the rights of the land owners are to be respected, and if they have consulted their own convenience in derogation of those rights they not only subject themselves to the legal consequences, but during that proceeding preclude this Court from interfering on their behalf. For these reasons, in accordance with the principles of this Court, 10 which I think the minerals are to be protected, I am, in my opinion, bound to reject the remainder of the application. ------- Injunction ordered until answer or further order to restrain the Defendants, their agents, and servants, &c. from entering upon, digging, taking, and carrying away any of the minerals, comprehended and described in the licence to Peter Duffy

S.J. Chronicle - Dec. 9, 1853 Albert Mining Company. - One Tuesday his Honor the Master of the Rolls delivered judgement and granted an injunction, at the instance of the Albert Mining Company, against Eugene LeGal and others, which will have the effect to restrain any further prosecution against the Company; so that their operations may be carried on without further annoyance. The Hon. John H. Gray, Q.C., the Hon. Attorney General, and James W. Chandler, Q.C. argued the case of the Albert Mining Company; and Hon. R.L. Hazen, Q.C., W.J. Ritchie and D.S. Kerr, Esquires, for

Chronicle -Nov. 11, 1853 and Headquarters - Nov. 2, 1853 The Albert Mining Company against Eugene LeGal,and Others. - During the whole of last week the Court of Chancery was occupied in hearing council for and against the Plaintiff's application for an injunction to restrain the Defendants from interfering with their mining operations at Hillsborough, in the County of Albert. The Master of the Rolls after a full hearing of the case has taken time to consider. For the Plaintiffs- The Hon. the Attorney General, J.W. Chandler, Q.C., Hon. J.H. Gray, Q.C. For the defendants - D.S. Kerr, and W.J. Ritchie, Esquires. - Headquarters."

Royal Gazette - Mar. 1, 1854 and N.B. Courier - Mar. 18, 1854 ADVERTISEMENT: Albert Mining Company. Notice is hereby given, That at a Special Meeting of the Stockholders of the Albert Mining Company, held at the Office of the President, in Saint John, on the 15th inst., it was resolved that calls on the Stock of the Company be made to the extent of ten pounds per share. In accordance with which Resolution, holders of Stock in this Company are hereby required to pay into the hands of the Treasurer, at the Office of Edward Allison, Esquire, in Saint John, on or before the twenty seventh day ofMarch next, ten pounds per share on the amount of Stock severally held by them. H.E. Allison, Treasurer.

Morning News - Jul. 4, 1855 Gas Coal. - At the Merchant's Exchange Room are some specimens of a highly bituminous and lustrous coal, from Hillsboro', New Brunswick, especially adapted to the manufacture of gas. These are not picked specimens, but taken loosely from a cargo which has just arrived; and certainly we have seen nothing bearing the name of coal so clear and brilliant. We are told that for gas purposes it is unequalled. - Boston Transcript."

N.B. Courier - Mar. 29, 1856 The Albert Mining Company. - This company, we learn from good authority, is now in most successful operation. After the lawsuits which involved it at the outset, had terminated, preparations for pushing work actively commenced and a competent mining engineer was engaged, and a large steam engine, with a powerful pumping apparatus, planted, by which the works were quickly freed from water which had greatly impeded the progress of the workmen. Regular deliveries of ""Albertite"" from the mines have been made, for which, $10 per ton, delivered on board at Hillsboro, was received for last year's sales, and will be paid for orders since received for this year's delivery. Such prices on the limited supply of not more than 10,000 per annum, will yield the company, for the same time, more than £10,000

Carleton Sentinel, Page 170 - Saturday, June 26, 1858 - (from Clowes) - Sackville Borderer - We learn from our correspondent at Albert, Samuel J. Calhoun, Esquire, ""that quite an extensive business is doing this spring at the Albert Mines. A new clipper schooner, launched last fall, called the S. L. Tilley, and several large vessels, are engaged conveying the Albert coal to the United States. There are several fine looking vessels building at Hopewell, and farming is carried on very extensively throughout the country this year. The people are looking forward in prospect of better times.""""

S.J. Morning Freeman - Mar. 1, 1859 To The Editor of the Freeman. - Sir:- In your report of the assault case between Foulis and Wright, it would appear as if I favoured Mr. Wright, when the evidence of Mr. Allison and Mr. Harding, two respectable gentlemen who were present, stated as follows: Mr. A. said both were in a fighting attitude, and one as fierce as the other, and one as much to blame as the other. Wright came round the table first, but did not strike. Mr. H. stated that he saw the whole of it; that Wright did not strike, but Foulis did, and would have struck again, had he (witness) not held his arm; that Wright had an opportunity to strike, but stated he would not do so. He saw all that took place, and in answer to Foulis said Wright might have put his fist up to Foulis' face first. You will please correct the statement in your next. Yours, &c. H.T. Gilbert. I certify the above to be correct. Edward Allison. St. John, Feb. 26th, 1859."

Codes: J8 / IDX_Names: Albert Mines;
S.J. Morning Freeman - Feb. 26, 1859 POLICE OFFICE. - FRIDAY. - Mines and minerals. - Robert Foulis, a gentleman well known in St. John, charged Alex Wright, Esq., J.P. in the County of Westmorland, with having assaulted him. His statement was that having heard a vein of coal has been discovered in Albert County, he called at Mr. Allison's office to ascertain if it was on the ground, the right to the mines of which he had purchased. Mr. Wright was in the office, but complainant did not address him, but spoke to Mr.Allison. Wright said the mine was not in his lot, and accused him of having caused him to pay £180 for land that was worthless. He replied he was sorry it was not more. Wright, using abusive language, came round and attacked him violently. He then put himself in an attitude of defence, and when Wright struck at him he seized him by the throat. The two persons by then interfered. Mr. Allison said the two quarrelled, and one was as bad as the other, but he believed Wright first assumed an offensive position. John Harding did not see any assault take place, though it might have occurred. The two had high words. The Magistrate knew Mr. Wright, and the evidence was not such as to satisfy him that he, a Magistrate of the County of Westmorland, had committed an assault, and he would dismiss the case. Mr. Foulis said he was told before he came into Court that this would be the result. The Magistrate ordered him into arrest for contempt, but finally told him he could go. Mr. Foulis offered to explain, but the Magistrate did not want any explanation."

New Brunswicker - Jul. 26, 1859 Coals. - Rich discoveries of minerals of various descriptions are yearly being made in this and the adjoining Province. Some of them are of the utmost benefit to science, commerce, and domestic enjoyment. We all remember the discovery of the famous Albertine, and the many different opinions expressed relative to its value at the time; but the beautiful oil which is now extracted from it is too well known to require commendation, as thousands of householders in this City and elsewhere can testify to its value for illuminating purposes. Recently a new coal mine has been discovered on the river Hebert, in the County of Cumberland, N.S., the coal from which possesses some excellent qualities, and after a fair trial, we feel satisfied must come into general favour with our people. From the specimens we have seen, it is not a bright looking coal, and is hard to appearance, but when lighted, it burns with a strong heat, and cements together like orrel coal. It possesses one peculiarity which is remarkable, it will last longer than any other coal we have ever seen kindled. From personal experience, and the experience of others who have tried it, we would recommend a trial of this coal to our citizens. Should the mine turn out as is expected, it will supercede the English article in this market, and establish a reputation in other places, besides realizing handsome returns to the proprietors. Messrs. George A. Lockhart & Son, are the agents in this City."

Morning News - Mar. 4, 1859 and Carleton Sentinel - Mar. 12, 1859 The Wealth of Albert County. - Nine years ago the first lot of coal taken from the mines in Albert County, was dumped out of a wheel barrow. Since that time the profit on the mineral and the oil extracted from it, after paying labor and other expenses, has amounted to a sum of £50,000. Eight thousand tons of Albertine coal, the supposed yield of the mines for the present year, has been contracted for at $15 per ton - making a sum of $120,000. Five thousand tons is contracted for by the New Brunswick Oil Works Company, and the remainder goes to the United States."

S.J. Morning Freeman - Mar. 8, 1859 To the Editor of the Freeman. - Sir:- I perceive by the communication in your Tuesday's issue, signed H.T. Gilbert, that our worthy Stipendiary has felt uneasy at your Police report of Saturday, published under the head of ""Mines and Minerals"", detailing the trial of Alex. Wright, J.P., for an assault which I alleged he committed on me in Mr. Allison's office, Mr. Gilbert fearing, very justly I believe, that from your report (which was substantially correct as far as it went) that the public would think he favoured Wright because he was a J.P. of Westmorland, his own native county as he stated. The Stipendiary, in giving his decision, stated that he knew Mr. Wright to be a J.P., and the evidence was not such as to satisfy him that he, a respectable Magistrate (save the mask!) had committed the assault, and he therefore would dismiss the case. Now, Sir, his amended statement of Tuesday does not put the matter in a more favourable light for showing his impartial justice, which he seemed after all to think required Mr. Allison's certificate; yet that does not deny that Wright first put himself in an offensive position, holding his fist up to my face and using threats, which was in fact the assault complained of. Mr. Harding's evidence in favour of Wright in my humble opinion does not, as the Stipendiary now states it, help his view of the case, and is also extremely defective, for he first swears that he saw the whole of it, saw all that took place; but he afterwards admits, when cross-examined, that Wright might have put his fist up to Foulis's face first. He thus admits that he might not have seen the whole of it, nor all that took place, although he first swore that he did. R. Foulis."

N.B. Courier - Apr. 14, 1860 The Bill to enable the Prince of Wales Coal Company, of New York, (U.S.) to hold property in this Province, was passed by our Legislature on the 30th ult. The Bill is similar to one passed this season to afford the same facilities to the Victoria Coal and Oil Company. The amount of property to be held was limited to the value of £20,000, and the limits prescribed within which the Company should hold and employ the property for manufacturing and mining purposes. In the Council the Bill was warmly opposed by the Hon. Mr. Robertson, and as warmly advocated by the Hon. Mr. Steeves. The observation of the former that these foreign companies applied for charters principally from motives of speculation, was denied by the latter, who said that they could now hold leases at 999 years, and that in these applications they sought the power to manage, not to speculate."

Codes: J8 / IDX_Names: Albert Mines;

N.B. Reporter - Jan. 20, 1860 The county of Albert is every day becoming of more importance. In addition to the Albert Mining Company we have the Caledonia Mining and Manufacturing Association, getting under way in very creditable shape; and now another and a later discovery, said to be upon a more extensive scale that either of the others, and an association formed which bids fair to rival, if not to exceed, all the rest. The coal (if that be the name) is of the same description, quite equal in quality, it ..?.. exactly the same, and the quantity we are informed appears to be untested. The gentlemen who form this last association are undoubtedly possessed of the means to put it through; and ..?.. hope for the sake of the country, as well as for their benefit, that nothing may occur to prevent their doing so. Every new enterprise of this kind deserves to be encouraged, and ..?.. only discharge a public duty when we say success attend it. - Westmorland

Morning News - Feb. 6, 1861 Albert County. - … Mr. Duval was then introduced. His subject was ""Albert County - its Mountains, Mines, Minerals, Manufactures, Marshes and Mud."" … All the Mines in the Province might be said to be in Albert County, as the Coal Works at Grand Lake were hardly worthy of the title of ""Mine"". The most valuable of these was in Hillsboro', and was discovered by the Duffy brothers in 1850, who observed the outcropping of the coal upon the giving way of a mill dam upon one of the streams; the coal was at first used for household purposes, (for which it did not answer well); for making gas; and finally for the manufacture of oil, for which purpose he believed it was the most valuable article in the world. After detailing the various circumstances connected with the history of the Mines, the lecturer went on to express his regret that they were owned almost entirely in New York. From 14,000 to 15,000 tons of coal were annually taken from the mine, and it sold at the wharf at Hillsboro' for $15 per ton; one fourth of the quantity raised was sent to the Oil Works at Spurr's Cove, and the remainder went to the States; from 80 to 100 men were employed in summer, and 60 to 80 in winter; from $400 to $500 were paid weekly for wages, and the Government received 1s. Per ton royalty off the coal raised, all of which was beneficial to the Province, to say nothing of the provisions, etc., used; so that while it was unfortunate that we did not own these works, still he could not agree with the writer in one of the recently published Essays,

who said that these Mines might as well be in Bunker Hill, or at the bottom of the ocean, for any benefit they were to the Province. Last year a dividend of 110 per cent. Upon the paid up capital of the Company was declared, the greater portion of which, it was true, was lost to the Province. At these Mines three gangs of men are employed; they work about 8 hours, and are then relieved; though at times but four hours work are required. Quite a village has sprung up at the Mines, and there is a good School there, supported by taxation, (the lecturer here declared himself in favour of this principle, and contended that the present law making it optional was useless and would never effect any thing), every miner paying 6d. a month to the support of the school, and 6d. a month extra if he attended himself, or a like sum for each one of his family."
New Brunswicker - Mar. 19, 1861 ADVERTISEMENT: Improved Albertine Lamps. The subscribers have received a full assortment of Hanging, Side, Hand, Stand and Parlour Lamps, with the new Economical Burner, which is so superior to all other burners. Also, a large stock of Glass and Paper Shades, Chimney, Wicks, Chimney Brushes, pure Albertine Oil, &c. The public is requested to examine our New Burners and Lamps, and convince themselves of their superiority. Geo. F. Everett & Co., Druggists, 9, (foot) King street."

Headquarters - Apr. 23, 1862 ADVERTISEMENT: Albertine Oil! At Brayley's Drug Store. Persons who are in want of a good illuminating oil that will not smoke. And that is free from disagreeable smell, And that will not explode, And that is in every respect a safe oil to burn, should buy the Albertine Oil. As the other dealers in an inferior kind of burning oil is asserting that their oil is of the same quality as mine, I publish below an extract of a letter received the other day from the agent in St. John. -- St. John, April 7, 1862 Mr. J.W. Brayley, Dear Sir, - The former lot of Albertine, as well as the last lot, are made from pure Albert Coal, you are the only person in Fredericton that has got it for sale. Mr. Lemont and Chestnut & Sons got our Albertine oil last summer, but not any since September or October last. Of all the oils imported from the United States last year, there was not a gallon of pure coal oil, nor were there sold in St. John, for the past twelve months, one gallon of pure coal oil, but what we made from the Albert coal. Yours, very truly, John McGrath"

Morning Freeman - Aug. 14, 1862 The Albert Mining Company resist the assessment of their stock, and have obtained an injunction to restrain the Corporation (City?) from enforcing payment for the present."

Morning News - Jan. 6, 1862 ADVERTISEMENT: Explosive! Hazardous!! Extra Hazardous!!! The leading Fire Insurance Companies in the United States have declared Petroleum Oils, Well Oils, Barth Oils, and sundry other Oils as highly Dangerous, liable to Explode, Hazardous, and Extra Hazardous! Of all the illuminating Oils, Albertine Oil is pre-eminently the best, it burns longer, gives a steadier light, and more light For Less Money than any other Oil. Albertine Oil is perfectly safe in use, and in this respect unlike many other oils with numerous names, which are highly dangerous, explode in the lamp, set fire to persons and property - several instances of which have occurred in this vicinity within the past few weeks. The Albertine Oil Company are now prepared to fill all orders, at Wholesale and Retail, for their genuine Albertine Oil, pure and unadulterated, manufactured from the celebrated Albert Coal. John McGrath, Agent, Albertine Oil Depot, 32,

Morning News - Jan. 6, 1862 ADVERTISEMENT: Portlandite Illuminating Oil. The subscribers have received from the Portland Kerosene Oil Company, 30 bbls. of their Best Illuminating Oil. This Oil is manufactured from the Albert Coal of New Brunswick, and is equal to any Oil manufactured on this Continent, and is superior to most of the Oils sold in this City. It is free from Naptha or Benzene, is non-explosive, does not gum the weeks, gives a clear and steady light, is as lasting as any other Oil. Not a single accident is known from the use of the Portland Oil. Price 10 cents a pint, 19 cents a quart, 38 cents a half gallon, 75 cents per gallon. A large discount by the barrel. Geo. F. Everett & Co., Druggists. 9 (foot)

S. J. Morning Freeman - Aug. 18, 1863 Denis Driscoll, a labourer, fell from a platform in the coal shed of the Albertine Oil Company, and sustained such injuries that he died on Monday morning."

Daily Telegraph - Sep. 3, 1863 Albert County Correspondence. - Miles of Land near the Mines being Locked Up by American Speculators. - Provincial Capitalists Apathetic. - ... Mr. Editor. - In your issue of the 18th inst. you gave a general invitation to your Albert county correspondents to furnish the doings of some American mineral hunters recently in this region. I have waited with patience and examined with care the succeeding numbers of your paper in vain to find the invitation accepted. Rather than the editorial heart should pine for lack of the desired information, I proceed to furnish briefly the facts as I have been able to gather in reference to the visits of these confessedly astute and certainly very reticent American gentlemen. In the month of May last three gentlemen came toHillsboro and proceeded at once to lease lands south and southwest of Albert Mines. One of these gentlemen has since visited Hillsboro twice, in company with another Bostonian, and at each time lands were taken, the last time in a northeasterly direction from the Mines, until all the land for miles in the above direction has been leased upon various terms for mining privileges. It is 6 understood that at least two of the three gentlemen above mentioned are concerned in the mining operations so extensively carried on at Little Glace Bay, on the eastern coast of Cape Breton, where they have expended about $100,000 in excavating a harbor capable of holding seven or eight common sized vessels. They will doubtless apply for a charter of incorporation next winter, at which time we will probably hear more about them. It is not expected that active mining operations will be commenced here before next spring. It is not creditable to our Provincial capitalists that these lands should have lain in undisturbed possession of the farmers for the last ten years, around and in full view of the successful working of the richest and most profitable coal mine in the world, without even an attempt to invoke their hidden treasures. No wonder they feel chagrined and humiliated when enterprising American capitalists step in before their eyes, and, sans ceremonie, propose to develop the resources of their Province. But it is time that this dog in the manger policy, in reference as well to our mineral wealth as to everything else, was for ever abandoned. It has surely wrought ruin enough in the public domain in the immunity allowed to speculators and capitalists to lock up from the frugal and industrious settler some of the most fertile lands in the Province. ... Vindex"

S.J. Daily News - Apr. 4, 1864 The Princess Alexandria Mining and Manufacturing Company has been duly organized at Hillsboro'. The following are the office bearers:- Treasurer and Secretary, J.G. White. Directors - S.P. Shaw, Horatio Bigelow, A.H. Twembly, W.J. Parsons, H.L. Hazelton, Leverett Saltonstall and George Snell, Esquires. The capital stock of the Company is divided into 5,000 shares of $100 each."

Codes: J8 / IDX_Names: Albert Mines;
S.J. Daily News - Jan. 29, 1864 Another Mining Company under the denomination ofthe ""Princess Alexandria Mining and Manufacturing Company"" has been formed in this Province. It proposes to raise Coal, Shale, Asphalt or Asphaltic Rock, and for raising, manufacturing and trading in oils. Capital $500,000, divided in shares of $100 each. Principal office to be established at Hillsboro'."

N.B. Courier - Jan. 23, 1864 Another Mining Company. - In the last issue of the Royal Gazette, the Provincial Secretary gives notice that John Gardner White, William Garland Howe, and William Loring Beal, of Boston, Mass., James White, of Hillsborough, and Joseph Lytle Moore, of Dorchester, in this Province, have filed the necessary papers for the formation of ""The Princess Alexandria Mining Company."" The object of the Company is to mine for Coal, Shale, Asphalte, or Asphaltic Rock, and for raising, manufacturing and trading in oils and other lubricating and illuminating substances. The capital is $500,000 divided into five thousand shares of $100 each. The principal place of business of the Company is to be at Hillsborough."

S.J. Daily News - Dec. 6, 1865 The Hillsboro' Advocate says that a number of gentlemen, including Professor Hinds, have been engaged during the past week in making a geological survey of land owned by the ""Princess Alexandria"" Company, with a view to obtain reliable information as to the precise locality where coal may be most easily obtained."

Daily Morning Telegraph - Feb. 11, 1865 The Albert County Mines. - [From the Mining Journal] New York, Jan. 28, 1865. To the Editor of the U.S. Mining Journal: A recent trip to New Brunswick has confirmed some curious views of mine, entertained several years since, concerning the position and origin of the famous Albert coal. It lies in an anticlinal fault, nearly vertical cutting across the strata as distinctly as any true lode of iron or copper. At the surface nothing can be seen but a film of coal of the thickness of paper, yet cutting through the strata. This gradually widens as it descends, till it becomes workable, obtaining a thickness of from six and seven to twenty-eight feet. Another feature, like that of the lodes, is the intersection of veins. Two veins cross the anticlinal one; but whether a larger amount of coal will be found at the intersecting line, as is the case with metallic lodes, remains to be seen. If this Albertite is to be called coal, then we must admit that coal is not continued to beds subordinate to the stratification, but occurs also in lodes, like metallic ores. This coal must have been injected into the crevices in a pasty or fluid state, since all the little apertures streaming off from the main vault, and even large cavities of many cubic yards extent have been filled in with it. It appears to me that these veins are analagous to veins of Petroleum. The latter are often found to occupy anticlinal vaults. If we should conceive a Petroleum vein to solidify, the solid mass resulting would present all the phenomena of the Albert vein. And on the other hand, the study of the irregularities of the Albert vein, if it be like Petroleum, would ellucidate the sinking of oil wells. It is a pity that the facilities afforded by the Albert Company to scientists for the study of their interesting mine are so meagre, on account of this application for the benefit of oil-borers. At the depth of 950 feet, the Albert coal is as abundant as ever. My examinations were made for the benefit of the East Albert Company of Boston, who have found the Albert vein upon their property, and have as good prospects of success as the Albert Company at the commencement of their operations. No stock in either company can now be purchased. The older company, for five or six years, has been paying over one hundred per cent. annually up on their capital. C.H. Hitchcock Mining Geologist"

S.J. Daily Globe - Jul. 1, 1865 The fire in the Albert Mines has been extinguished."

St. Andrews Standard - Jun. 13, 1865 and Morning Freeman - Jun. 13, 1865 The Albert Mines took fire on Tuesday last and have been burning ever since, although it is probable that by this time the fire is effectively checked. All the streams in the vicinity were turned into the mines - It is not likely that the damage will be very great."

S.J. Telegraph - Jun. 24, 1865 Hillsboro' Advocate.- Fire at the Mines.- We regret to learn that the efforts to subdue the fire at the mines have hither to proved unsuccessful. The opening of the shaft on Monday, when it was expected the fire was extinguished, added fuel to the flames, and as we write we hear that the fire has reached the upper ""level"" where it seems likely to continue for some time. We hope it may be prevented from extending beyond its present limits."

S.J. Daily News - Jun. 26, 1865 The efforts to subdue the fires at the Hillsboro' Mines have as yet proved unsuccessful."

S.J. Morning Freeman - Feb. 8, 1866 Advertisement: Albertine Oil - The Albertine Oil Co. have reduced the price of their burning oil to fifty-five cents per gallon by the barrel. Apply to the Albertine Oil Co. 33 Prince Wm. st."

S.J. Daily Globe - Feb. 26, 1866 The East Albert Mining and Manufacturing Company have recently been much encouraged by striking a small vein of coal about twelve inches wide."

Codes: J8 / IDX_Names: Albert Mines;

S.J. Daily Globe - Sep. 17, 1866 Explosion in a Coal-laden Vessel at Hillsboro'. -The Eastern Advocate says that on the evening of the 12th, an explosion occurred on board the ""Quickstep"", Capt. Charles Dickson, lying at the coal wharf, and partially loaded with Albertite. Not being ventilated, gas had generated in the hold, and a man entering with a lighted lamp an explosion occurred, producing such injury to the vessel that she will be almost valueless. The bows are completely parted so that she leaks like a riddle. There was some insurance on her, and the coal will be mostly saved."

S.J. Morning Journal - Apr. 8, 1867 The East Albert Mining and Manufacturing Company are sinking a new shaft back of that on which they have been working for some months. In the new shaft they follow the vein of coal which is visible at the surface, and expect to meet with greater success than has hither to crowned their labors."

Morning Freeman - Oct. 22, 1867 Accident. - A man named Joseph Oats had his hands so severely injured by an explosion in the East Albert Mining Company's pit on Tuesday last that amputation was found necessary. He with two others, Samuel Rogers and Mr. Gammon were drilling a hole in a rock which they had previously failed to blast in consequence of some deficiency in the fuse. Unfortunately they reached the powder sooner than they expected and a spark from the drill caused it to explode. Gammon and Rogers were not severely injured. Oats is doing as well as can be expected. He is an Englishman and married. - Eastern Advocate."

S.J. Daily News - Feb. 11, 1869 Accident at Albert Mines. - A Frenchman by the name of White had his leg broken in the Albert Mines last week, by the falling of a stay-log timber or breasting, lossened from its position by the explosion of gas in the mine. Under the treatment of Dr. Lewis of Hillsboro he is now doing well. No other person was injured."

Morning Freeman - Jul. 29, 1869 and S.J. Daily News - Sep. 2, 1869 The Albert Mines. - We are informed that the Albert Mines have been on fire for the past two or three days; and that, unless speedily extinguished, very serious damage may result. - GLOBE"

Daily Telegraph - Sep. 2, 1869 The Albert Mines have been on fire for several days."

S.J. Daily News - Sep. 2, 1869 Reports state that on discovery of the fire, the various openings to the mines had been closed in a way usual on such conditions. Up to latest advices the stopshad not been removed, and, of course, no entrance to the mines was attempted. It is probable, however, that an early effort will be made to ascertain the actual condition of affairs. If ordinary means fail, of course water will have to be introduced."

S.J. Daily News - May 23, 1870 The Circuit is still occupied with the case of Spurr vs. The Albert Mining Company. The evidence was concluded on Saturday, and this morning the Counsel will present their respective cases to the jury, after which the Judge will address them. Petit Jurors are expected to be on hand for any case that may come up this morning."

Royal Gazette - Jul. 26, 1871 Notice. The Annual Meeting of the Stockholders of the East Albert Mining and Manufacturing Company will be held at James Blight's Office, in Hillsborough, New Brunswick, on Monday, August 7th A.D. 1871, at eleven o'clock, a.m., for the purpose of electing Officers, and transacting such business as may properly come before the meeting. James Blight, Agent."

Chignecto Post - Sep. 7, 1871 The Albert Mines, we regret to learn are again onfire."

Daily Telegraph - Oct. 4, 1872 Albert Mines. - The Times states that John Byers, Esq., has resigned his position as Manager of the Albert Mines. He was a passenger in Monday's train for St. John, being on his way to England. Many in Albert will regret that Mr. Byers leaves the country, and will follow him with their best wishes. Mr. Wm. Golding succeeds him in the management of the mines."

Codes: J8 / IDX_Names: Albert Mines;
Daily Telegraph - Oct. 10, 1872 A Deep Boring. - One of the deepest rock borings in the world is that at the Alexandria Mines, Albert County, which is now being made under the superintendence of James Blight, Esq. The work is being done with a diamond borer which makes a hole about two inches in diameter. It is being worked down through shale at an angle of fifty degrees from the horizon, and has now reached a depth of about nine hundred and forty feet. The rods to which the borer is attached are growing very heavy as their length increase, but although they rest all along one side, in consequence of the angle of the boring, the friction is not so great as one would expect to find it. The borer may be worked with either a hollow or solid shank, the latter being used when the operators wish to determine the exact nature of the formation through which they are passing, and the other when the object is only to penetrate as far and as fast as possible in a given time. The rods are not withdrawn sometimes for days, as the matter removed by the borer is forced up to the surface by water sent down by a force pump. The borings brought up are received in a vessel arranged for the purpose, and, being drained, their nature is ascertained. Mr. Blight intends working down to a depth of about a thousand feet. He is endeavoring to strike the seam of the rich bituminous coal for which the locality is celebrated, and has already passed through several minor lodes. The borer at first penetrated the rock at the rate of twenty-five or thirty feet a day but now works at the rate of five or six feet daily. The rods composing the borer are screwed to each other, end to end, and great care has to be experienced in operating them lest they should break in which case they would probably be lost. Should the coal not be found in the present attempt another boring will be made. The company is one of the richest in the Dominion and Mr. Blight appears to be just the man to represent it. He is an Englishman born in the famous mining district of Cornwall and as he has been successful in discovering some of the richest coal deposits of Nova Scotia and New Brunswick, it is quite possible that he has a good reason of his own for believing that the large expenditure now being made by him will, in the end, result in the opening up of a new and rich mine."

Daily Telegraph - Aug. 30, 1873 Heavy Work. - Messrs. Fleming & Sons, at the Phoenix Foundry, are engaged on some heavy machinery, engines and boilers for the Spring Hill and Albert coal companies. ..."

Royal Gazette - Jul. 30, 1873 NOTICE. The Annual Meeting of the Stockholders of the East Albert Mining and Manufacturing Company will be held at James Blight's Office in Hillsborough, Province of New Brunswick, on Monday the fourth day of August, 1873, at eleven o'clock, a.m., for the election of Officers, and the transaction of such business as may properly come before the meeting. Edward Lawson, Sec'y. Hillsborough, July 19th, 1873 James Blight, Agent."

Daily Telegraph - Oct. 17, 1873 [From the Times] Albert County News. - The Albert Coal Company are sinking a new shaft near to the located line of the Albert R.R. The depth calculated for boring is nine hundred feet, and all the requirements in building and machinery will involve an expenditure of some forty of fifty thousand dollars."

S.J. Daily News - Apr. 2, 1874 Presentation at the Albert Mines. - On Friday evening Mr. Golden who has been foreman of the Albert Mines for a long time, and who is about leaving Albert County, gave a farewell party, which was attended by all the miners and their lady friends, and a large number of other invited guests. Shortly after the party had assembled, Mr. Bishop, the school master of the place, read an address, expressing regret at the announcement that Mr. Golden was about to leave them, and wishing him a long and happy life. Wr. Wm. Goodwin, the engineer of the mines, then approached Mr. Golden, and on behalf of the miners, presented him with a splendid gold watch and chain. The recipient returned his most heartfelt thanks for such an expression of kind wishes, and assured his friends that no matter where he lived, he would never forget the affection of the miners and their friends."

Codes: J8 / IDX_Names: Albert Mines;
S.J. Daily Telegraph - Apr. 24, 1874 Presentation to the Manager of the Albert Mines. - Albert Mines, April 21st, 1874. Mr. Editor: You will, doubtless, agree with me that the valuable Albertite coal is well enough known throughout the Dominion, and even the entire continent, not to need much comment here, suffice to say that the production this last winter has been large, and the company have already commenced conveying it on their rail track to the place of shipment. Ours is a world of change, and it may be truly said of this place. Our present manager is to leave us the last of the present month, and in contemplation of which, at a public gathering of the inhabitants at the manager's residence, on Friday evening, 17th inst., the following address was read and memorially presented:- Wm. Golden, Esq., Manager Albert Mines:-Dear Sir; The inhabitants of Albert Mines feel anxious to express their sorrow at leaving them, after being so long a time their sincere friend and protector. We can truly say we have ever highly appreciated your conduct toward us since your first coming amongst us, and we do not know of any better way of expressing our present feelings on the matter than by presenting you with a memorial of some value in order to show you our love and regard for you. So we would beg of you the liberty of presenting to you this Gold Watch, valued at $114, hoping it may be sufficient to impress upon your mind how highly we appreciate you. And as you are now about to leave us to go to distant parts, rest assured that you carry with you our highest and best wishes, and we sincerely hope that health and prosperity may attend you and your family. We would add a word of gratitude to your beloved partner, who has so many times and in so many ways shown how kind her heart was, especially in the sick room, where she has ever shown she could not do too much to relieve the sufferer. And, lastly, may the blessings of Almighty God be poured down upon you in abundance, both of a spiritual and temporal nature, and to every one of your family. Written in behalf of the inhabitants of Albert Mines. James W. Bishop. The following reply was the made by Wm. Golden, Esq:- To James W. Bishop, and the employees at the Albert Mines:- Gentlemen: Allow me most sincerely to express my thanks to you for the handsome present which you have now made me. I shall ever prize it, not only for its intrinsic value, but also and more especially as conveying an expression of your good will and love for me. I shall be proud of the gift as a memento of your liberality and esteem. I need hardly say that the prospect of leaving you produces within my breast feelings of a painful character. I look back on the past seventeen years, during which I have resided among you, with a good deal of pleasure, and regard them as embracing the happiest period of my life. My associations with you, in your daily toil, as also occasionally in your homes and with your children at the Sabbath School, have been of an agreeable nature, and now contemplating leaving you I feel that I am leaving warmhearted, generous friends. May Divine Providence continue to bless you, your wives and little ones. Your kind reference to the care for your safety which I have endeavored to manifest in the positions which I have occupied at the Mines, I duly appreciate, and here I would express my gratitude to that good Providence which has saved us from those terrible calamities which so frequently occur in connection with mining operations. May you continue to have the Divine protection. Mrs. Golden is gratified with the mention you make of her attention to the sick, and feels more than rewarded by your grateful recognition of her services in this particular. For your good wishes for myself, wife and family, please accept our united thanks. And now, friends, believe me that wherever in the future my lot may be cast, I shall never cease to desire the welfare of you and yours. Again thanking you for your kindness, I remain, Yours affectionately, William Golden"

Daily Tribune - Apr. 29, 1874 A Chapter of Mining History. - The readers of Provincial journals are often entertained with extracts from the mining literature of the States, and seldom serve up the materials that lie around loose nearer home. Except when a new mine is discovered, a company formed, a pic-nic held at the works, or some facts come out in reference to Hon. Alex. MacKenzie's silver mining grab in Ontario, we hear nothing about our mines. One concern -The Albert Mining Company - has been so totally neglected by the press that its existence had been forgotten when its name appeared on the records of the Supreme Court as defendant in the case of Spurr vs. The Albert Mining Co., a case in which judgment was given against the defendant last Saturday. This Company has a secret history, of course, as what mining company has not? A portion of the history of this corporation is worth telling for its own sake, and will prove of especial interest to those who think of taking stock in a concern that is controlled by one or two large owners. More than half of the stock of the Albert Mining Co., at the opening of our story, 1864, was controlled by W.H. Newman, of New York. The proxies for his shares were held by the Messrs. Gilbert, of this city, who owned a few shares of their own. So Mr. H. Gilbert was elected President with a salary of $2,000, and Mr. S. Schofield became Secretary with a salary of $800, and a bye-law was adopted providing that no business could be transacted at any meeting at which more than one half of the stock of the Company was not represented. At the next annual meeting the Messrs. Gilbert did not produce the proxies they held for the shares owned by Mr. Newman, and the meeting was adjourned under the bye-law. Every year thereafter the same farce was played, The Annual General Meeting adjourned without getting any statement from the officers of the

Company, without electing new officers, without doing anything at all. Year after year the shareholders met and adjourned as ignorant of the affairs of the Company as they were before. At the session of the Legislature in 1873 ""An Act relating to Corporations"" was passed without attracting the attention of anyone interested in opposing it, providing that Annual General Meetings of stock companies might proceed to business without regard to the number of shares represented, any bye-law to the contrary notwithstanding. So last July, when one of the Gilberts proposed that the ""meeting do adjourn on account of the absence of a majority of the stockholders"", one of the stockholders took ""An Act relating to Corporations"" from his pocket and read it. The President and the Secretary were astounded, as this was the first intimation they had of the existence of such a law. The doctrine, inculcated by some, of the unimportance of the proceedings of the Local Legislature, had been adopted by them to their sorrow. Picture the perplexity of President and Secretary. ""The proxies, go for the proxies,"" said one brother to the other as soon as the power of speech returned. ""Where are they?"" helplessly asked the recipient of the order. As the proxies had not been used since 1864 the place of their deposit was almost forgotten, but one of the brothers finally recollected that they were in C.W. Wetmore's safe. One went for the proxies, therefore, while the other presided over the meeting, read the minutes of the last meeting (1864) and ground his teeth at the tactics of the small shareholders. But the key of the safe could not be got, as it was in the pocket of an absent man. A shareholder insisted on a statement of the affairs of the company being read, and an election of directors held. Messrs. Gilbert asked an adjournment. The majority of the shareholders insisted on proceeding to business, and the President and Secretary gathered up the books and papers and cleared out. Then those who were left behind elected themselves directors, and declared a dividend of $10 a share on the six thousand shares of stock. At a subsequent meeting of the directors Mr. J.I. Fellows was chosen Pres. and Mr. H.L. Sturdee, Secretary. The Gilberts would not acknowledge the validity of the transaction, and refused to give up the books and papers of the company. The manager at the mine also refused to obey the orders of the new officers. President Fellows took precautionary steps to prevent any of the company funds being drawn by the ousted officers, and one of the stockholders, Mr. Spurr, brought suit against him and his associates for the dividend that had been declared. The suit would, of course, determine whether Mr. Fellows and his associates had been lawfully elected directors of the company, and, therefore, a quo warranto was applied for in the interests of the ousted officers, and refused. Then a motion was made to set aside the writ on the ground that those against whom it was directed were not the legal officers of the company. This motion was refused last Saturday, the

S.J. Daily Telegraph - Dec. 12, 1874 Albert Mining Company. - The annual meeting of this company is to be held in this city on the 12th. prox."

S.J. Daily Telegraph - Jul. 3, 1874 ADVERTISEMENT: Albert Mining Company. -- The Annual Meeting of the Stockholders of this Company will be held on Tuesday, 7th July next, at 12 o'clock, noon, at the office of Messrs. Gilbert & Co., Cushing's Building, Prince Wm. street. S. Schofield Secretary."

S.J. Daily Telegraph - Jul. 9, 1874 Albert Mining Company. - The annual meeting of this company was held on Tuesday, and Messrs. Henry Gilbert, Bradford S. Gilbert, Thomas Gilbert, John Byers and Alex. Duncan were reelected directors of the company by a vote of 4898 shares against 976 shares. The total number of shares in the company is 5968, the remaining 94 shares not being represented at the meeting. It is therefore claimed by this company that the old directors still retain the confidence of a very large proportion of the stockholders. Full and satisfactory statements of all the affairs of the company were laid before the meeting by Henry Gilbert. At a meeting of the directors held yesterday, Mr. Henry Gilbert was re-elected President, and Mr. S. Schofield Secretary of the Board."

Morning Freeman - Jul. 9, 1874 The annual meeting of the Albert Mining Company was held on Tuesday. The representatives of the large number of shares took care to be present on this occasion with all their proxies, and the directors of last year were not re-elected. Messrs. Byers, Duncan, B. Gilbert, H. Gilbert and T. Gilbert were elected, and Mr. Arnold, of the firm of Vroom & Arnold, was appointed Auditor of the Company's accounts."

Codes: J8 / IDX_Names: Albert Mines;

Royal Gazette - Jul. 22, 1874 Notice. The annual Meeting of the Stockholders of ""The East Albert Mining and Manufacturing Company,"" will be held at James Blight's office, in Hillsborough, N.B., on Monday the third day of August, 1874, at eleven o'clock, a.m., for the election of Officers, and the transaction of such business as may properly come before the Meeting. Edwin Lawson, James Blight, Secretary. Agent."

S.J. Daily Telegraph - Jun. 16, 1874 The Albert Mining Company - Award in Favor of Mr. Spurr. - In the case of James DeWolf Spurr against the Albert Mining Company, the arbitrators under a rule of court, Messrs. Simeon Jones, Geo. DeForest, and Z. Ring, have made their award, and the same was filed yesterday. They find that a sum of $14,892 is due to the plaintiff by the company. The arbitrators have been at work in Mr. Fellow's office for several evenings. The case has been a good one for the lawyers. Mr. Spurr's counsel were Messrs. Palmer and Weldon. Mr. Fellows (of the new company), had Mr. Skinner and Mr. Sturdee for his counsel, and Mr. S.R. Thompson was counsel for the Messrs. Gilbert (of the old company). It is possible that other gentlemen of the long robe were engaged, whose names we have not heard."

Codes: J8 / IDX_Names: Albert Mines;

Daily Telegraph - Oct. 20, 1874 Down The Albert Mines. - As a rule, we prefer sunlight, and solid ground, and have no ambition to descend into mines, or join an Alpine Club, or in fact go anywhere that is not perfectly safe, and should be the last man to engage in any adventure that might involve a fracture of the spinal column. Nevertheless, on the invitation of Mr. D' Orsay, the night ""overlooker,"" a veteran miner, a countryman, and a Derbyshire man to boot, backed by the consent of the manager, we agreed to ""do"" the Albert Mines on the ""night shift"", as the most appropriate season. How It Looked. - It rained drearily as we issued from the cookhouse, about nine o'clock, with the overlooker, arrayed in a woollen shirt and overalls, with a ""headlight"" stuck in an old hat. This light was a fine thing until the wind blew it out; and an illuminated hat would be a handy thing in the streets of St. John. We managed to grope our way across the bridge to the engine-house door, and were glad to get out of the drizzly darkness to the bright coal fire burning in the capacious chimney at the mouth of the shaft, the warmth of which contrasted pleasantly with the chill, damp air descending from over head though the open part of the roof. Going Down. - Everything was quiet. The business of the day was over, and the man in charge of the shaft was indulging in a glance over the columns of the Telegraph by the fire, occasionally brightened by a handful of Albertite coal, which, by the way, is never used for the sacrilegious purpose of fuel. We are taken to the dimly lighted engine room, and invested with a safety lamp, of which we feel awfully proud. The aspect is generally drowsy; the engineer is reclining on a bench, and even the great engine breathes heavily in a wheezy doze. We are next taken to the mouth of the shaft, and find a coal tub waiting, which we are invited to enter. The overlooker takes his stand on the edge, the signal is given, a fresh handful of Albertite illuminates our departure and we glide silently down the depths of the shaft, which gradually becomes shiny and wet, until we finally pull up at a depth of 800 feet, at a level on the east side, and land in a sort of entrance hall, which has been excavated to accommodated a horizontal windlass. Along the Level. - From thence we enter a long gallery lined every inch of the way with trunks of trees put close together, every set of three (the two side ones and the one overhead costing $6 in the first instance, and $3 for renewals). We received a sudden warning to ""mind your head"", and thought we did mind it, but the next moment a crash ensued, stars danced before us, and we imagined that one of the $2 timbers had received serious injury, and we should be sued for damages. We picked up our hat, thankful the ""head light"" had not gone out, and the mine had not caved in, but all we knew about mining left us from that instant. We had brought a note book, but between our head, the head light and the safety lamp, we found enough to do, and hopped along in a sort of Bosjesinan dance, with our neck askew till it ached, and we were told we had ""struck the vein"", and felt convinced we had. Then a door opened; a man was seated on the ground behind it with a safety lamp. He was politely called the ""day overlooker"", and after a short dialogue on ""slopes"", ""shoots"" and ""benches"", and a glance at the fire under the upcast shaft, we turned off at right angles, determined to ""mind our head"" this time, and at last arrived within sound of a low rumble, and were told to squeeze ourself into the wall. This seemed unreasonable, but our faith was great, and we presumed the laws of nature might wink at things down here; so we squeezed, and the next moment a spectre with a safety lamp passed us, and a loaded coal wagon made a shave at us. Here our open lights were dispensed with, and a little further on we halted amid a group of demons of the mine, who laughed ironically as the head of the overlooker disappeared through the roof of the level, up the side of the wall. We followed up a short, rude ladder, and edged through a trap into a sort of subterranean hen roost, with a slanting roof, supported by props; our guide led on all fours, and we followed under the impression that we had entered the noble order of Odd Fellows, or were going in for a Master Mason, according to popular belief. We got on our feet again, however, for it was only a playful ""dip of the vein"" that caused us temporary inconvenience and after passing a hole in the track, which we were told was a ""coal shoot"", leading perpendicularly to the bottom of the mine, two hundred feet, we arrived at the foot of a ""slope,"" ascending perpendicularly 50 feet. To get at this slope we had to climb upon a pile of slabs, and then feel for the first log. It was, in fact, a sort of steep inclined plane, the main portion of the log supported on each side, about a yard distant from step to step. It was pretty difficult for a novice to ""find things"" in the dark, and the ascent was tedious, but we at last came out through a tramway on another level, thinking that one slope was about enough, but thankful that we had not disappeared through the logs on the journey. This was nothing; suffice it to say, that before we reached our journey's end, we were put through two or three more ""slopes"" and traversed several more levels, at a great risk of disappearing down ""coal shoots"" and coming out at the bottom, if there was any. It is difficult to keep a connected view of things by the dim light of a safety lamp; we only know that we visited several places in our rambles where coal was being extracted from the vein. Sometimes these places were yards wide, and sometimes they were only a few feet, the vein being very irregular in its dimensions and being known to contract from 20 feet to a point. At one of these places, which had just been started from a level, the coal was cracking and flying off in scales at a fine rate from the mere removal of the rock in front, giving a novice the idea that ""things were coming together"" for his amusement. We crept up into the hole, and at one blow of the pick received a shower of coal in the face which at once convinced us how easily it might be extracted. We had hitherto followed our guide with implicit faith, had listened to his explanations of ""slopes"" and ""benches"" with profound attention, for it was somewhat droll to hear a strong Derbyshire accent 800 feet below the level of New Brunswick, and if he had proposed to ascend till we came out at the south pole, we should have followed him without a murmur; but when, after all we had gone through, he told us that we were immeasurably distanced by a Boston girl, who had come up from the bottom of the mine on a stepladder of logs 200 feet high, we felt that it was no use ""seeking the bubble reputation"" any further, and gave in to the Hub. Giving in was one thing, but going down again was another, and infinitely worse than coming up. The orthodox way of descending a slope is to slide down in the trough, but it is rather hard on pants, and a beginner might be rather awkward in ""putting on the brakes"", which is done by putting out a leg against the roof. We did not ask what a Boston girl did, but quietly groped down the logs after the overlooker, who apologized for adopting this manner of descent, by saying that his wife was not at home, and that he would have to repair his own damages should rents occur. After

getting down the three slopes or slides to our great joy, especially at finding our limbs were all there, seeing we had taken liberties with them we should never have dreamt of doing in broad daylight, we were conducted through a door to a quiet ""level"" laid with a tramway like the rest. This level we presumed was the ""drawing room of the mine"", as it had a damp, unused, sunless atmosphere about it, heightened by an aroma of decayed wood, and was moreover provided with an elegant settee in the shape of a log to sit down on. A little further on there was an opening between the rails of the track which looked like a grave. This, we were told, was the entrance to the 200 feet stepladder which led to the mysterious regions at the bottom of the mine - to which the coal from the levels descended, and was drawn to the shaft by the horse that ground his oats in perpetual darkness, in order that thousands of people not much more enlightened might have gas - here the pumping engine first drew water, and here, added our informant, with a sudden thrust, ""the Boston girl came up."" That was enough; we were reduced to silence, and as we sat in the gloom, waiting for the men on the ""shift"" to go up at 11 o'clock, our thoughts took a cheerful cast. We thought what a nice place this level would make as a chamber of the Inquisition, and pictured men on racks, or swallowing water by drops, or writhing with their legs in ""boots"", eight hundred feet below the orthodox and heretic fellow Christians on the surface. We imagined the politicians of Albert County spending a quiet week down here, and ""coming up"" with wonderfully broad, unanimous and enlightened views. Then we lost ourselves, when all at once the timbers of the roof and sides of the level came out from the gloom with a terrible distinctness in glowing fire, a female with dishevelled hair shot up the abyss, madly waving a safety lamp, in a manner which would have delighted the artist of Graphic or Life Underground. We had seized and carried her the wrong way somewhere, when a touch on the arm, accompanied by a Derbyshire accent dimly revealed the underlooker on his feet, safety lamp in hand, announcing that it was a quarter to eleven, and that the men would soon be coming out. We passed through the opened door into the other level, and were presented with a ""head light"" as a signal that our nocturnal festivities were over. We bade friend D'Orsay good night, leaving him to continue his rounds, poke up the fire at the upcast shaft, and descend to feed the horse, taking our departure, in charge of a youth, who informed us as the eleven o'clock ""shift"" passed up, that the men would soon be coming, and that they generally ran out of the mine, a fact soon verified by the sound of feet behind us, followed by a miner on the trot close at hand, soon joined by others at the same gait. In the high part of the level, this was all very well; but to run with your body done up in a right angle, under the impression that your hat is taking fire, is trying, and the monotony was soon broken by another ""crash"", accompanied by a new planetary system, by the light of which we recovered hat and extinguished lamp, and with the aid of ""Davy"" made the best of our way over wet and dry to the shaft. The miners sprang on the edges of the tub, as we took an inside place, and we went gyrating up the shaft, towards the mouth of which we perceived that a heavy rain had commenced on earth since our departure. The bell in the engine room jingled in the distance, the ""tows"" slackened their speed, and we ascended
again into the presence of the bright fire and the newspaper. We had hoped to get over at least half a century down below, but had only been about two hours. The clock pointed to eleven, and your valuable columns to the same debatable question, about which people were knocking their heads together when we left, even the Albert railway was not completed - the world was evidently stuck at the same place. We were somewhat surprised to find that our trip through the mine made us stiff and sore for four days after. It is, however, very well ventilated, the currents of air in fine weather being sometimes strong enough to blow a safety lamp out. The levels are generally dry, both above and under foot, with some few exceptions. Since the vein of Albertite has been discovered on the east, it is intended shortly to explore on the west. In this direction, indeed, considerable work has already been done under Mr. Blight for an American Company, whose property adjoins that of the Albert Mining Company, but hitherto without any tangible success, in spite of considerable boring and shaft sinking, though there is some talk that ere long operations will be resumed. Of sublunary affairs the miner seems to take most interest in boat racing, though there is something paradoxical in a man engaged in poking down coal 800 feet below the surface, being delicately sensitive as to the state of the weather on the Kennebecasis. His laconic way of alluding to the serious calamities to which his calling is unfortunately liable, would startle ""a dreadful accident man"". For instance, he will tell you ""There were eighty at the Drummond, and the widows got two dollars a week, with a dollar for each child."" It is needless to say that temperance is pretty strictly enforced at the mines. The men are mostly married, and rent houses built by the company, each householder being allowed ample ground for cultivation. An industrious man

S.J. Watchman - Dec. 11, 1875 Albert Mining Company - The annual meeting of the Albert Mining Company, will be held at the office of the Company, in St. John, on Tuesday, 11th January, at noon."

S.J. Daily Telegraph - Jan. 23, 1875 Albertite. - As is generally known, the vein in the county of Albert, from which this mineral is taken, has been worked to a depth of more than 1,300 feet. The dip of it is nearly vertical. This mineral, though often called coal, is not such in reality, since coal has been formed by the decomposition of vegetable matter, probably under great pressure, at some former period of the earth's history, as is evinced by the accompanying remains of trees and vegetable matter imbedded in or covered by adjacent rocks and earth. Some considerable time past when the miners were sinking on this vein, an indentation was found running deep into the walls, as if representing a cavity from which a rock had dropped. Strange to say, after the miners had gone down 150 feet on the vein, they found the stone which had fallen from this cavity, imbedded in the mineral of the vein. The stone had probably descended down the fissure prior to its being filled by Albertite, then most likely in a liquid or pasty state."

Royal Gazette - Jun. 30, 1875 Notice. The Annual Meeting of the Stockholders of The East Albert Mining and Manufacturing

Company, will be held at James Blight's Office in Hillsborough, N.B., on Thursday, July 15th, 1875, at 2 o'clock, p.m., for the election of Officers, and the transaction of such business as may properly come before the Meeting. Edwin Lawson, Sec'y. James Blight, Agent Hillsborough, June 26th, 1875"

S.J. Daily Telegraph - Nov. 5, 1875 Albert - Mr. Blight, the indefatigable manager of the P.A. Mining Company has lately been greatly encouraged by having struck a vein of coal from one to two feet thick with his diamond borer in the Princess Alexandria mine. This mine is a short distance southwest of the Albert mine, and all the friends of Mr. Blight and the company will be pleased to hear that the indications above noted give promise that it will become a valuable property."

S.J. Daily Telegraph - Nov. 17, 1875 Civil Docket: #37 Albert Mining Company vs. Spurr et al. - S.R.Thomson."
Codes: J8 / IDX_Names: Albert Mines;
S.J. Watchman - Nov. 20, 1875 The Moncton Times states that Mr. Blight, Manager of the Princess Alexandra Mining Co., who has been boring with a diamond drill in the vicinity of the Albert Mine, has passed through two seams of coal, - Albertite, we presume, the first one to two feet thick, the second eight feet thick. This is good news."

S.J. Daily News - Nov. 29, 1875 The Albert Mining Company have declared adividend of $5 per share on their capital stock, payable on 26th inst. The total dividend to be divided among the shareholders is $29,840."

S.J. Watchman - Dec. 30, 1876 The Albert Mining Co.'s annual meeting will be held in Cushing's Buildings, Prince William St., on Tuesday, Jan. 9."

Daily Telegraph - Jan. 12, 1876 Circuit Court:#27 Albert Mining Company, vs. Spurr, et al. - S.R. Thompson #47 The Spring Hill Mining Co. vs. Sharp, et al. - Forbes & Sinnott."

Royal Gazette - Jul. 5, 1876 Notice. The Annual Meeting of the Stockholders of The East Albert Mining and Manufacturing Company will be held at James Blight's Office in Hillsborough, N.B., on Thursday, July 30th, 1876, at two o'clock, p.m., for the election of Officers, and the transactions of such business as may properly come before the meeting. H. McK. Twombly James Blight, Agent. Secretary & Treas. E.A.M. & M. Co."

Morning Freeman - May 20, 1876 Albert Mines. - The Albert Mining Company have lately struck a new seam of albertite said to be 13 feet wide. This is very encouraging, and will make business lively at the mines again. - Times."

Daily Telegraph - Aug. 30, 1877 Albert Co. - Albertite coal is now being shipped in large quantities to foreign ports."

Daily Telegraph - Dec. 8, 1877 ADVERTISEMENT: Albert Mining Company. --The annual meeting of the stockholders of the Albert Mining Company will be held at the Office of the Company, Chipman's Hill, St. John, on Tuesday, Jan. 8th, 1878, at 12 o'clock, noon S. Schofield secretary."

Royal Gazette - Jul. 11, 1877 Notice. The annual meeting of the Stokholders of the East Albert Mining and Manufacturing Company, will be held at James Blight's Office, in Hillsborough, N.B., on Thursday July 19th, 1877, at two o'clock, p.m., for the election of Officers, and the transaction of such business as may properly come before the Meeting. H. McK. Twombly, Sec'y. James Blight, Agent. Hillsborough, June 28th, 1877."

Chignacto Post - May 10, 1877 One Man Killed and Two Injured by Blasting. - An explosion took place on the night of the 2nd, about 12 o'clock by blasting at the Albert mines. One man named Boyer was killed. He was a faithful laborer, and was much respected by all. He leaves three small children. Their mother died some time since. Two other men were wounded, and one is not likely to recover. An inquest will be held. Amos Jackson, one of the two wounded is since reported dead. John Dee, the other wounded man is likely to recover. In regard to this most melancholy affair no one is in the least

Morning Freeman - May 12, 1877 Sad Accident at the Albert Mines. Hillsboro. - Two Lives Lost. - On Thursday morning last between one and two o'clock an explosion occurred in a pit of the Albert Mines which caused the death of two of the workmen and serious injuries to a third. A correspondent gives us the following particulars: Wm. A. Boyd, Amos Jamieson and John Dee were employed in blasting a rock, and Boyd, who had charge of the work, directed Dee to put an extra heavy charge of powder in the hole prepared for it. It appears that the powder was not properly secured at the top and that the blast came out at the top, and igniting the fine coal dust, caused an explosion. Boyd and Jamieson were found about 15 feet from the rock, showing either that they were somewhat careless or that the powder ignited sooner than they anticipated. Boyd was struck by pieces of rock and instantly killed, and Jamieson was seriously injured about the head and was so badly burnt so that he died next morning. Dee, who lighted the fuse, was probably out of range of the discharge and, though badly hurt, his injuries will not likely prove fatal. Boyd was about 35 years old and leaves three orphan children. Jamieson was a young man 18 years old and son of Mr. Joseph Jamieson at the Mines. The accident caused a deep feeling of sadness at the Mines and the works were shut down during the remainder of the week. No blame can be attached to the Managers, as the accident appears to have resulted from the failure of the unfortunate men to exercise sufficient care in making preparations for the blast. - Times."

Morning Freeman - Nov. 7, 1877 Railway Accident at the Albert Mines. - On Monday, the rolling stock of the Albert Railway was engaged, as is customary, in shunting loaded cars of Albertite at the junction of the Albert Road and the Mining Company's branch and pushing them down to the end of an embankment where they are received by the Company. Eight cars had been shoved down and were left to the care of the brakeman Cameron; but they appear to have gained such headway, that before Cameron could get them under brake control, they had reached the end of the embankment and gone over it, being smashed and the contents scattered. The damage is from $500 to $600. - Moncton Times."

Codes: J8 / IDX_Names: Albert Mines;

Moncton Times - Nov. 7, 1877 Albert Mines. - More Coal Discovered. - Large deposits of coal have been discovered in what is called the East Shaft, and operatives are busily employed in bringing this to the surface. Owing to the apparent close of navigation, the shipments are about ended until the spring, as the summer contracts are supplied. The new shaft about half a mile west from what is called the West Shaft is progressing favorably. It is let to contractors and in short time tunnels or levels will be undertaken with a view to discoveries of albertite. - The old West Shaft is now being extended to cover 100 additional feet, from which depth new tunnels or levels will be effected. - Tel."

Chignecto Post - Nov. 8, 1877 New discoveries of Albertite have been made in the vicinity of the Mines and the most favorable indications are apparent. If the present anticipations be realized, the permanency of the present prosperity of this part of Albert is insured."

Chignecto Post - Nov. 8, 1877 Hillsboro Items.- New Work.- A new shaft has been sunk 125 feet deep, half a mile west of the old West Shaft, which is being sunk to a further depth of 125 feet for exploring purposes."

Daily Telegraph - Aug. 9, 1878 Albert Mines. - Large quantities of coal have been taken from the shoot, during the summer, direct to the wharf by the Albert Railway for shipment. Coal is now being raised at the west shaft while sinking is being affected at the east shaft."

Daily Times - Dec. 14, 1878 Albertite Coal. - The last vessel is now being shipped for the season. The operations, nevertheless, proceed at the mines, during the winter months as summer, giving employment to many hands."

S.J. Daily Globe - Dec. 24, 1878 Advertisement: Albert Mining Company. - The annual Meeting of the Stockholders of this Company will be held at the Office of the Company in Bayard's Building, Prince William Street, St. John, on Tuesday, 14th January, 1879 at 12 o'clock noon. S. Schofield, Secretary"

Daily Telegraph - Jan. 14, 1878 Albert Mines. - Early in the month of November last, Albertite coal raising was discontinued at the West Shaft, and due preparations made for further sinking. On the 5th Nov. last, the work of excavating began at a depth from the pit head of 1,298 feet, and on the 5th of the present month (just eight weeks) 118 feet were added to the above depth, and within the same time all the work of timbering, etc., was fully executed, making a total depth of 1,416 feet from the surface, probably the deepest coal shaft, from the surface to the lowest extremity, is 20x20 feet. The driving of a new tunnel to obtain the coal is now being effected. During the autumn season and up to the present the work of raising coal has been carried on quite extensively at the East Shaft, which is evident by the large pile or bank on the surface under the dump. The explorer shaft some three-fourths of a mile west of the present works, commenced in the month of September last and is now 250 feet deep. The hoisting is done by horse power. The usual supplies of timber, lumber, etc., are daily brought on the grounds, the season being unexceptionably favorable for the prosecution of work at

S.J. Daily Globe - Nov. 23, 1878 Fire - A building at the Albert Mines was destroyed by fire last night. It was occupied by Mr. G.B. Willett, and was insured for $500 in the Commercial Union Insurance Co. The building was owned by the Albert Mining Company. Mr. Willett saved very little of his stock which is said to be insured for $3,500. The fire broke out about 10:30 0'clock; origin unknown."

S.J. Daily Sun - Nov. 23, 1878 Fire at the Albert Mines. - A Hillsboro correspondent of the SUN, writing on the 22nd. says:- The Albert Mining Company's store at the Albert Mines... was destroyed..."

Daily News - Oct. 9, 1878 Exhibition. - ... While admitting the existence of many valuable deposits of coal, as well as gold in our sister Province, far exceeding those yet developed in New Brunswick, we can refer with pride and satisfaction to our great Albertite deposits in Albert County, which have for several years been yielding immense profits; and we have the confident expectation of further developments of this most valuable material in both the Counties of Albert and

Moncton Daily Times - Aug. 27, 1879 Arbitration Between the Albert Railway and Albert Mining Company. - At an inquisition recently held at Hillsboro to ascertain and assess the damages sustained by the Albert Mining Company by reason of the works and operations of the Albert Railway Company, through and upon their lands. There were present Messrs. Byers, Ketchum, with S.R. Thomson and Geo. Gilbert, Esq.'s, on the part of the Mining Company, while the Railway was represented by Messrs. A.E. Killam, Thomas McHenry, and C.A. Peck, Esq.'s. Mr. Killam kindly sent a special to convey the jury and representatives over the road to the mines. On the return both the parties agreed on a verdict to be rendered by the jury, which was only to be enforced in case the Albert Railway Company neglect to provide crossings and sufficient land for a tramway, after a year's notice, in case the Albert Mining Company finds it desirable to replace the tramway, etc., and so long as the Albert Railway will carry the Company's coal at the same rates as at present. All parties were well pleased with the arrangement, and what seemed likely to be a serious difficulty has been amicably arranged. The jury was composed of Messrs. W.H. Casey, Alfred Stevens, E. Peck, Gideon Bray, and Jonathan Robinson, Esqr's."

Codes: J8 / IDX_Names: Albert Mines;
Daily Telegraph - Aug. 28, 1879 Albert Railway and Albert Mines. - The Moncton Times states that a question of damages to the latter interest by the former was recently amicably arranged at Hillsboro, the jury named rendering a conditional verdict, to take effect in the event of certain crossings, and other facilities not being provided. The jury consisted of W.H. Casey, Alfred Stevens, E. Peck, Gideon Bray and Jonathan Robinson. There were present Messrs. Byers, Ketchum, with S.R. Thomson and Geo. Gilbert on the part of the Mining Company, while the Railway was represented by Messrs. A.E. Killam, Thomas McHenry and C.A. Peck."

S.J. Globe - Jan. 13, 1879 Circuit Court: Remnant Docket: Connolly vs. Shives and Fisher - Pugsley, Crawford & Pugsley. New Docket: Albert Mining Co. vs, Spurr - S.R. Thomson"

S.J. Daily News - Jan. 15, 1879 The Annual Meeting of the Albert Mining Company was held in their office, Bayard's Building, at noon yesterday. The only business of importance done was the election of officers of this company for the ensuing year. The following directors were chosen: - Henry Gilbert, Esq., President, and Messrs. J.S. Gilbert, Bradford S. Gilbert, Esq., Robt. Duncan and John Byers. S. Schofield, Esq., was again elected Secretary, and R.H. Arnold, Esq.,

S.J. Globe - Jan. 15, 1879 The Annual Meeting of the Albert Mining Company was held in their office, Bayard's Building, yesterday. The following directors were chosen: - Henry Gilbert, Esq., President, and Messrs. J.S. Gilbert, Bradford S. Gilbert, Esq., Robt. Duncan and John Byers. S. Schofield, Esq., was again elected Secretary, and R.H. Arnold, Esq.,

Moncton Daily Times - Jan. 17, 1879 Albert Mining Company. - At the annual meeting ofthe Albert Mining Co., held in St. John, Wednesday afternoon, the following directors were chosen: Messrs. Henry Gilbert, John Byers, Bradford S. Gilbert, Alexander Duncan and James S. Gilbert. At a meeting of the directors immediately afterwards the following officers were elected:- Henry Gilbert, President; S. Schofield, Secretary; John Byers, Consulting engineer."

Moncton Daily Times - Jul. 7, 1879 NOTICE: The Annual Meeting of the Stockholders of the Princess Alexandria Mining and Manufacturing Company will be held at the Company's Office, in Hillsboro, New Brunswick, on Thursday, July 17, 1879, at 11 o'clock, a.m., for the elections of officers and the transaction of such business as may properly come before the meeting. B.A.G. Fuller, Sec'y. James Blight, Agent. Hillsboro, June 23, 1879-jun25 21"

Daily Telegraph - Jun. 26, 1879 Albertite Coal. - Vessels are arriving in this port frequently, to receive this valuable product for foreign and home consumption. During these times of extreme financial depression much credit is accorded to the Albert Mining Co. for their monthly cash payments of about $4000 per month, distributed throughout the county for the general good of all trade. May great success attend this industry, and their enterprising efforts prove most remunerative to all concerned for years to come."

S.J. Daily Telegraph - May 28, 1879 and Moncton Daily Times - May 29, 1879 Albertite Coal Shipment. - The first vessel chartered by the head office, St. John, for the shipment of albertite, this season, is the Maggie Willet, which is daily looked for, to receive her cargo at the Hillsboro Albert Mines coal wharf. A large quantity of this valuable produce has already been transported by the Albert Railway to the company's wharf for foreign ports. The business of the season will likely be brisk in this commodity."

Daily Telegraph - Dec. 18, 1880 Albert Mining Company. -- The annual meeting of Stockholders of the Albert Mining Company will be held at the office of the Company, 130 Prince William street, St. John, on Tuesday, 11th January, 1881, at 12 o'clock, noon. S. Schofield, Secretary."

S.J. Daily Telegraph - Feb. 7, 1880 Mr. Haddow, who has acted as engineer for 14 years at the Albert Mine, left there on Wednesday last for Michigan."

S.J. Daily Telegraph - Jan. 14, 1880 Equity Court - New Docket: 1. Albert Mining Company vs. Spurr - S.R. Thomson."

S.J. Daily Telegraph - Jan. 14, 1880 and Moncton Daily Times - Jan. 15, 1880 Albert Mining Company. - At the annual meeting of the stockholders of this Company held, in St. John on Tuesday, the old Board of Directors were re-appointed for the ensuing year, namely, Henry Gilbert, John Byers, Bradford S. Gilbert, Alexander Duncan and James S. Gilbert. At a meeting of the Directors held subsequently Henry Gilbert, Esq., was re-appointed president and S. Schofield, Esq.,

S.J. Daily News - Jan. 14, 1880 Albert Mining Co. - At the annual meeting of the stockholders of this Company held yesterday, the old Board of Directors were reappointed for the ensuing year, viz: Henry Gilbert, John Byers, Bradford S. Gilbert, Alexander Duncan and James S. Gilbert. At a meeting of the Directors held subsequently Henry Gilbert, Esq., was reappointed President and S. Schofield, Esq., Secretary."

Codes: J8 / IDX_Names: Albert Mines;
S.J. Daily Telegraph - Jan. 19, 1880 Westward Ho. - ... Mr. Wm. Haddow, for a great many years in the employ of the Albert Mining Company, as engine driver, is planning to take his departure for Michigan early in next month."

Moncton Daily Times - Jun. 22, 1880 Meeting of Stockholders. - The Annual meeting of the stockholders of the Princess Alexandria Mining Company will be held at Hillsboro on the 15th prox., at ten o'clock a.m., for the election of officers."

Chignecto Post, Page 3 - Thursday, December 8, 1881 LOCAL MATTERS - The closing of the Albert mine is a great loss to the parish of Hillsboro, and will increase the heavy taxes in the whole County after readjusting, which should be forth with

S.J. Daily Telegraph - Dec. 16, 1881 The Albert Coal Mines. - The plant of the Albert Coal mines, sold at auction a short time ago, was purchased by Messrs. J. McGoldrick & Co. at a figure in the vicinity of $2,500. Already about eight car loads of the material has come over the ICR, and the rest is being shipped."

Moncton Daily Times - Dec. 20, 1881 Mining Matters. - The annual meeting of Stockholders of the Albert Mining Company will be held at their office, 130 Prince William street, St. John, on Tuesday, 10th January, 1882, at 12 o'clock, noon. The St. John Sun understand that Mr. Chas. Wilder, with whom are associated the Hon. Senator Carvell, Mr. Lewis Carvell, Dr. A.H. Chandler, and Mr. Jas. M. Piper, of Boston, has received several telegrams during the past week from Boston capitalists, with regard to the purchase of the 'Malagash' copper mine. These gentlemen control several other valuable mining properties in Nova Scotia as well as in New Brunswick, which, with as little delay as possible, they propose developing during the present season."

S.J. Daily Telegraph - Feb. 2, 1881 Albert Mines. - More coal has been got out than at this time last year, but the prospect is by no means flattering."

S.J. Daily Telegraph - Jul. 18, 1881 Albert Court. - The case of Prince of Wales Coal Co. vs. C.J. Osman is now being heard. This case is one in which the title of the plaintiff to certain lands is disputed."

Moncton Daily Times - Jul. 23, 1881 Albert Circuit Court. - In the case of the Prince of Wales Coal Co. vs. C.J. Osman, an action of trespass, the jury was discharged without giving a verdict, the counsel having agreed to a verdict of $900 for plaintiff, with right to defendant to move for a non-suit in the court above upon points reserved. The question involved is the sufficiency of the plaintiff's title. F.E. Barker, attorney, E.L. Wetmore and C.A. Steeves, counsel, for plaintiff. M.B. Palmer, attorney; G.G. Gilbert and D.L. Hanington, counsel, for defendant."

Chignecto Post - Jul. 28, 1881 Surrey.- The pumps have been safely removed out of the pit at the Albert Mines and nearly all the remaining coals are on the wharf. As soon as these are shipped and matters adjusted, this hitherto useful industry will be closed."

Moncton Daily Times - Jul. 30, 1881 and S.J. Globe - Aug. 1, 1881 The pumps have been safely removed out of the pit at the Albert Mines and nearly all the remaining coals are on the wharf. As soon as these are shipped and matters adjusted, this hitherto useful industry will be closed."

Chignecto Post - Jun. 9, 1881 The Albert Mines Closed.- Very reliable reports affirm that the managers of the Albert Mines have decided to close further operations; and preparatory to this have commenced to remove the pumps. When this is done, the pit will fill with water, and it will be impossible either to bail it out again or replace the pump to do so. The closing of this mine means a great deal both to the Parish of Hillsboro' and Albert County generally. It means the loss of employ to many and the loss to all of the circulation of some four or five thousand dollars of cash each month, which has taken place regularly for twenty-five or thirty years. As this company was assessed for about one sixth of the valuation of the Parish, it means the addition of just one-sixth to every rate- payer's tax until a readjustment is made for the county, when this will be shared by the whole county. Religious and benevolent interests must suffer as well. For many (15) years, I have been acquainted with the management of this public work, and everything connected therewith has been so regular and methodical, that I have looked upon this as model company, and the manager a model officer; and it is with deep regret that I pen the closing of this useful industry which is only done because the mineral can no longer be obtained. X."

Daily Telegraph - Jun. 21, 1881 Albert Mines. - Already we see more than the beginnings of the end of operations at this place. The pumps are now being taken out. Not many weeks hence and the beautiful little village for so many years so active - so full of stir - will be deserted. Some 1,300 tons of coal got out since the close of last shipping season is now being brought to the wharf, where the schr. Maggie Willett is taking in a cargo of it."

Codes: J8 / IDX_Names: Albert Mines;
S.J. Globe - May 16, 1881 Circuit Court. - This morning the case of the Albert Mining Company vs. the Albertine Oil Company was taken up and it will probably occupy the attention of the Court for three or four days. It is a suit brought by the plaintiffs to recover a balance claimed to be due on 5,000 tons of coal sold the defendants at $11 a ton - an amount of about $7,000. The coal was delivered in 1866 and '67. The case was tried at the August Circuit of 1876 and the plaintiffs were non-suited. The non-suit was afterwards set aside and the case is now being tried again. The counsel are Dr. Tuck, Messrs. G.G. Gilbert and Jas. Straton for the plaintiffs, and Dr. Barker and Mr. Weldon for the defendants. This morning was spent in proving the bills of lading, which was done by Mr. E.B. Ketchum, accountant of the Albert mines."

S.J. Globe - May 17, 1881 Circuit Court. - The evidence for the plaintiffs in the case of the Albert Mining Company against the Albertine Oil Company having all been in, this morning, the counsel for the defendants, Messrs. Weldon and Barker moved for nonsuit on the ground that the evidence given did not bear out the declaration. Messrs. Gilbert and Tuck replied at length. The arguments were concluded at 2.30 this afternoon, and Judge Weldon then decided in favor of the motion, and nonsuit was granted. The case will again be appealed."

Daily News - May 17, 1881 Circuit Court. - The case of the Albert Mining Company vs. Spurr was continued in the Circuit Court today. Messrs. Barker & Weldon made a motion for non-suit this afternoon on grounds that the evidence was insufficient to support the suit. The motion was granted, and the court adjourned until tomorrow morning."

Daily Telegraph - May 17, 1881 Circuit Court. - The case of the Albert Mining Co. vs. the Albertine Oil Co. was taken up yesterday morning. The plaintiffs claimed to be due on 5,000 tons of coal sold the defendants at $11 a ton - an amount of about $7000. The coal was delivered in 1866 and 1867. The case was tried at the August Circuit of 1876 and the plaintiffs were non-suited. The nonsuit was afterwards set aside and the case is now being tried again. The counsel are Dr. Tuck, Messrs. G.G. Gilbert and Jas. Straton for the plaintiffs, and Dr. Barker and Mr. Weldon for the defendants. The morning was spent in proving the bills of lading, which was done by Mr. E.B. Ketchum, accountant of the Albert mines. He was followed by Mr. Schofield in the afternoon, and then Mr. Ketchum was recalled, after which Mr. Gilbert, of the Albert Co., took the stand. The latter witness had not finished when the court rose."

S.J. Daily Telegraph - Oct. 6, 1881 Albert Mines. - Everything in this once active place is now very quiet. Only a few men can be seen moving around the works, gathering up and taking care of whatever is of value. All old iron and worn-out machinery are being sent to the Londonderry Iron Works and most of the good machinery, etc., to Springhill."

Codes: J8 / IDX_Names: Albert Mines;
S.J. Daily Sun - Oct. 21, 1881 Albert County Sketches. - A Played Out Mine. -The Deserted Village. - Heculaneum was, Thebes was, the Albert Mine was, and all are equally silent now, all equally dead to the present and without hope of resurrection in the future. The Albert Mine was a unique deposit of coal, which became known to commerce as Albertite. It was so inflammable that pieces of it could be ignited with a match. It was mixed with poorer coal used in the making of gas, and now that it has disappeared petroleum is used instead. The mine was opened about thirty years ago, and was abandoned last June. During that time 280,000 tons of coal was taken from it, which was worth $18 to $21 on board at Hillsboro, a total value of between five and six million dollars. The vein, at one place, was twenty-one feet thick, and the level 700 feet below surface, which was 3,000 feet long, was the best one that was worked. After that the seam grew thinner as it went down, and after a depth of 1,400 feet was reached it narrowed very fast. At 1,500 feet it as no longer profitable to work it, but a well was sunk 100 feet deeper, in the hope that the seam would grow thick again. This hope was in vain, as it grew so thin that it became like a sheet of paper dividing the walls of the rock between which it was compressed. This was at 1,600 feet below the surface. The dip of the seam was nearly perpendicular, and there were no pillars left, as in other coal mines, to support the roof. Timber supports were inserted and the mine robbed as the work of excavation proceeded. Notwithstanding the extremely gaseous nature of the coal the accidents were few, only four men having been killed in the mine during the thirty years it was worked. Three fires occurred, necessitating the flooding of the mine. Great attention had to be paid at all times to ventilation in order that the men might work in safety. The capital of the company was $120,000 at first, and this was increased to $240,000. The dividends were very large, except when the fires and flooding caused a suspension of mining. The largest dividend in one year was 250 per cent. The stock was not, of course, in the market, but one can imagine what an exciting one it would have been on Change, and how it would have gone up or down with conflicting rumors as to whether the next dividend would be 150 or 200 per cent. The owners, unlike the Ontario Bank Directors, did not unload their stock when they found the mine giving out. They have evidently not been West, and have much to learn. The mine gave steady employment to 500 men, who resided in cottages and boarding houses owned by the company. They were paid in cash every month. Many of them cultivated gardens, and kept cows, pigs and poultry. There was a post office and telegraph station there. The village contains 75 dwellings, a church and

schoolhouse, and only three families remain to occupy them. It is, in fact, a deserted village. The men were sent away gradually, after it became clear that the mine was giving out, and found employment at Springhill, Pictou, or elsewhere. At the final collapse there were but few left. The water has risen steadily since the pumps ceased to work, and is now seven or eight hundred feet high, or half way to the top. Some of the pump castings that were raised weighed one and a half tons. The valve pieces were 1,382 feet below the surface. Fifty carloads of machinery have been removed and sold. There are 1,400 acres of excellent land to be sold. It is said to be adapted for a stock farm. Two hundred acres are cleared, one hundred more could be readily brought into hay, and there is plenty of pasturage for a large stock. The cottages would make warm stables for the stock, every animal having a room to itself, and there would be no danger of a scarcity of water with the mine to draw from. Mr. E.B. Ketchum, who was the manager for the last six years the mine was worked, is one of the most active promoters of our cotton mill, and one of the largest subscribers to its stock. The close of the mine injures Hillsborough some, of course, as the miners spent a great deal of their earnings there. The traders are the chief sufferers. The farmers find a ready market here for all the surplus products they used to sell to the miners, and are not affected much. There is something melancholy, apart from the material losses incurred, by the collapse of a wealth-producing mine like this, the scattering abroad of the people who worked it, and the desertion of the cottages and gardens where men and women lived and loved and hoed potatoes. The place depended on one industry, and ceased to be when that industry failed. And thus is the lesson which the Protectionists teach - that no country can be permanently prosperous

Chignecto Post - Sep. 1, 1881 Springhill purchases equipment from Albert Mining Co. ..."

S.J. Globe - Aug. 17, 1882 Mines. - It is currently reported that E.B.Chandler, Esq., together with several Boston capitalists, has purchased the Albert Mines, and that they will be re- opened in a short time. - Maple Leaf."

Daily Telegraph - Jan. 3, 1882 ADVERTISEMENT: Albert Mining Company. -- The annual meeting of the stockholders of The Albert Mining Company will be held at their office, 130 Prince William street, St. John on Tuesday. 10th January, 1882 at 12 o'clock, noon S. Schofield, Secretary"

Moncton Daily Times - Jan. 19, 1882 The Albert Mining Company advertise for tenders for mining lease with 1400 acres of land, and houses, barns, etc., in Albert; also land and wharf at Hillsboro, and engines as will further appear on reference to advertisement. Tenders will be received up to April 1st."

Codes: J8 / IDX_Names: Albert Mines;
Moncton Daily Times - Jan. 23, 1882 ADVERTISEMENT: Notice. -- Sealed Tenders will be received by The Albert Mining Company, at their office Bayard's Building, Prince William Street, Saint John, until Saturday, 1st April next, for the purchase of the Mining Lease and undermentioned property belonging to the Company, in Albert County. LOT 1. The Company's Mining Lease, together with about 1000 acres of Land, in one block, at the mines, together with the Houses, Barns and other buildings as they now stand thereon. The land is partially cultivated and capable of producing from 80 to 100 tons of hay per annum. There is also a considerable quantity of Hard and Soft Wood Timber on same. LOT 2. The Land and Wharf at Hillsborough, having a frontage of about eighty feet on the river, and extending back, preserving the same width, about two hundred feet, and being connected with the Albert County Railway. LOT 3. One Horizontal Winding Engine, direct action, twenty inches diameter and eight feet stroke, together with Fly Wheel and Shaft, and drum for flat wire rope, as now standing on the foundations at the mines. LOT 4. One Cornish Bull Condensing Engine, sixty inches diameter and ten feet stroke, complete with all modern improvements, as it now stands on the foundations at the mines. Tenders may be for either any one or the whole of the above lots. Terms of payment cash or approved paper. The Company reserve the right to reject any or all Tenders which may be made. Henry Gilbert, Jan 19 -dwtf President"

Daily Telegraph - Jul. 7, 1882 ADVERTISEMENT: Notice -- A Special Meeting of the stockholders of the Albert Mining Company is hereby called, to be held in the office of the company, Bayard's Building, Prince William street, St. John, on Wednesday, August 2nd, 1882, at 12 o'clock, noon. Benj. A.G. Fuller. June 24, 1882 Secretary."

Royal Gazette - Nov. 1, 1882 Notice. A meeting of the Stockholders of The East Albert Mining And Manufacturing Company will be held at James Blight's Office, in Hillsborough, N.B., on Wednesday the 22nd day of November, 1t 2 o'clock, P.M., for the election of Directors, and transaction of such other business as may properly come before the Meeting. C.B, Pratt, Josiah Pickett, D.H. Eames, James Blight. Hillsborough, N.B., October 30th, 1882."

Weekly Transcript - Nov. 27, 1882 Albert Co. - Mr. Golding, from Pennsylvania, atone time manager of the Albert Mines here, is in the county. His appearance here puts new life in the prospect of the mine being reopened."

Weekly Transcript - Feb. 7, 1883 Albert Co. - Mention is made that the Albert mines, now closed for over two years, may be opened again. There is a belief that Albertite can yet be found there in paying quantities. There is water over a thousand feet deep in the pit next the railway."

S.J. Daily News - Feb. 9, 1883 The water in the Albert Mines is now over 1,000 feet deep in the pit nearest the railway."

Weekly Transcript - Feb. 21, 1883 Albertite. - Mr. James Robinson, with a number ofmen, went down to Albert County today to prospect for albertite there, for Mr. Edward Chandler. Mr. Robinsonwas under ground manager of the old Albert Mines for a number of years."

S.J. Daily News - Jan. ?, 1883 Albert Mining Co. - The annual meeting of the Albert Mining Co. was held at 12 o'clock today in Mr. Samuel Schofield's office, 130 Prince William street. The annual report represented the mine to be doing a fairly successful business. All the old officers were re- elected."

S.J. Globe - Jan. 9, 1883 and Daily Telegraph - Jan. 10, 1883 and Moncton Daily Times - Jan. 11, 1883 The stockholders of the Albert Mining company held a meeting yesterday and elected the following directors for the ensuing year:- Henry Gilbert, John Byers, Bradford S. Gilbert, Alexander Duncan, James S. Gilbert. At a Director's meeting, held subsequently, Mr. Henry Gilbert was elected president and Mr. S. Schofield, secretary."

Weekly Freeman - Jul. 7, 1883 It is reported that a seam of albertite from 5 to7 feet in thickness, has been discovered on the property of the old mines company in the Parish of Hillsboro. Should this prove to be true it will result in a revival of the importance of the Albert Mines Village."

Moncton Daily Times - Jun. 22, 1883 and S.J. Daily News - Jun. 23, 1883 Discovery of Albertite. - It is reported that a seam of Albertite, from five to seven feet in thickness, has been discovered on the property of the old mines company in the Parish of Hillsboro. Should this prove to be true, it will result in a revival of the importance of the Albert Mines village."

Moncton Daily Times - Jun. 26, 1884 Meeting of stockholders. - The annual meeting of the stockholders of the Prince Alexandria Mining and Manufacturing Company will be held at the office of James Blight in Hillsboro, A.C., on the 17th

Codes: J8 / IDX_Names: Albert Mines;

Royal Gazette - Mar. 26, 1884 Notice. To the several Stockholders of the Albert Mining Company. Whereas by a certain Act of the General Assembly of the Province of New Brunswick made and passed the 24th day of April, A.D. 1882, intituled and Act to amend an Act intituled An Act to incorporate the Albert Mining Company, and to provide for the winding up of the affairs of the said Company, it was among other things provided that the President and Directors of the said Company should dispose of the property of said Company, and after payment of certain expenses in said Act mentioned, and the claims of all creditors of said Company who should file satisfactory proofs of their claims in the manner and within the time mentioned and limited by said Act, should pay the balance to and among the several Stockholders of the said Company in proportionate shares according to the amount of the several and respective shares in the Capital Stock of said Company. And whereas there is a balance remaining in the hands of the said President and Directors for distribution among said Stockholders; Notice is hereby given, (as required by said Act,) that the President and Directors of said Company a proportionate share of such balance according to the amount of their several and respective shares in the Capital Stock of said Company, at the Office of the Company, in Bayard's Building, 130 Prince William Street, Saint John, N.B., on or after the twenty ninth day of April next. Dated this twenty second day of March, A.D. 1884. Henry Gilbert, President Albert Mining Company."

Moncton Daily Times - Nov. 18, 1884 Albert Mines. - A correspondent writes: Mr. James Gilligan, surface boss at the old Albert Mines for 27 years, has removed to Moncton. His house at the Albert Mines was always open to receive the stranger and by all he will be greatly missed. We wish him success in his new home."

Moncton Daily Transcript - Nov. 29, 1884 Albert Co. News: - James Gilligan, surface boss at Albert Mines for 27 years moves to Moncton ..."

Moncton Daily Times - Sep. 16, 1886 and S.J. Globe - Sep. 14, 1886 The Fire at Albert Mines. - A Costly Blaze. - No Insurance. - On Wednesday afternoon of last week, fire was discovered in one of the engine buildings at Albert Mines, Albert Co., and in a short time five buildings were destroyed by the flames, namely: The engine house, with two engines in it, one blacksmith shop, the carpenter shop, a dwelling and storehouse. In the latter building there were 8,000 cedar shingles, other lumber, sleds, pungs, and a lot of tools destroyed. There was no insurance on the buildings, and the loss cannot be correctly estimated until Capt. Henry Calhoun returns from St. John. The loss of these buildings makes the mines look rather forsaken, and it is generally believed that their destruction is due to the act of an incendiary - as yet

S.J. Globe - Jan. 19, 1888 A Rich Vein of Coal Struck. - Capt. Henry A. Calhoun, who purchased the Albert mine at a nominal figure not long ago, has been prospecting lately in the neighborhood of the mine, and has struck a rich vein of coal, between five and six feet in thickness and of splendid quality. It is not known to what depth the vein runs. The mine has been closed for some time, the former owners being of the opinion that the mine was worked out. The re-opening of the mine will probably create a boom in Albert county."

Moncton Daily Times - Jan. 27, 1888 That Discovery of Albertite. - The Maple Leaf says: Some of our contemporaries have been making indefinite reports about a valuable discovery of Albertite coal at Albert Mines. Many of the statements are very incorrect. James Robinson recently drove a tunnel in from the level of the brook, below the highway and a short distance northwest of the residence, and on the premises of Captain Henry A. Calhoun. Mr. Robinson struck several small veins of coal, from 2 to 3 inches thick. When he had tunneled some 60 feet, and some 30 feet from the surface, he struck a vein 5 feet 3 inches thick and took out ten barrels of excellent coal. The tunnel is closed up for the present, and the result can hardly be foretold. Another tunnel will be made where the prospects seem better, and we sincerely hope to be able to report the opening of another valuable mine at the Albert Mines before very long. The reopening of such a mine will certainly make a boom in this country."

Moncton Daily Times - Sep. 27, 1889 Albert Co. - Mr. J. Robinson is at present engaged prospecting for coal at the Albert Mines."

Daily Telegraph - Nov. 23, 1891 and Weekly Record - Fri. Nov. 27, 1891 The Canada Mining and Mechanical Review says: The famous albertite coal of Albert county, N.B., at one time was the most extensive mining operation ever conducted in the province, from which thousands of tons of the precious albertite were extracted and its stockholders became very wealthy from its operation. Thesupply of the mineral, however, gave out; the mines were abandoned and all the costly machinery in due time removed and sold. Indications of this mineral are still to be met with in Albert, Westmorland, and Kings Counties, and much time and money have been spent prospecting for it. There are many who believe it will be found in sufficiently large quantities to pay for working."

S.J. Daily Sun - Mar. 30, 1892 ...C.J. Osman, manager of the Albert Manufacturing company....."
Moncton Daily Times - Dec. 19, 1893 Hopewell Hill, Dec. 13. - John Steeves, of Albert Mines, has discovered a coal mine on his property near the old mines, and has taken out a mining lease, preparatory to making extensive operations. Several of the residents are taking stock in the enterprise."

Codes: J8 / IDX_Names: Albert Mines;
S.J. Daily Sun - Mar. 30, 1893 Albert Co. - Hillsboro, March 24. - Four men are engaged prospecting on the East Albert coal property, back from Edgett's Landing. One seam of Albertite coal has been unearthed of twelve inches thickness, and one or two others of less size. It is reported that a number of men are coming, and work is to be pushed this summer under the direction of a Boston firm of the name of Splane & Co."

S.J. Daily Sun - Apr. 21, 1899 Hopewell Cape. - Capt. Henry A. Calhoun is advertising by posters the famous Albertite mines property, consisting of houses, barns, a church, etc.; also his large and well equipped farm here at the Cape, for

Moncton Daily Times - Apr. 17, 1900 Albert Mines Sold. - The Albert Mines property, owned by Capt. H.A. Calhoun, has been sold to A. McElwee of New York, representing the American capitalists who recently purchased the Salisbury and Harvey Railway and some mining properties in Albert. Capt. Calhoun and Mr. McElwee met in Moncton on Monday and completed the transference of the mines, which the new owners propose to prospect a new. The price paid is said to be $20,000. Mr. McElwee returns to New York in a few day's time."

S.J. Daily Sun - Apr. 18, 1900 The Albert Mines property, owned by Capt. H.A. Calhoun, has been sold to A. McElwee of New York, representing the American capitalists who recently purchased the Salisbury and Harvey Railway and some mining properties in Albert. Capt. Calhoun and Mr. McElwee met in Moncton on Monday and completed the transference of the mines, which the new owners propose to prospect anew. The price paid is said to be $20,000."

N.B. Reporter - Apr. 25, 1900 The Albert mines, owned by Capt. H.A. Calhoun, have been sold to the American capitalists who recently purchased the Salisbury and Harvey Railway. The price paid is to be $20,000."

Moncton Daily Times - Jun. 2, 1900 Albert Mines. - We are anticipating greater activity in business when the new company takes possession of the old Albert Mines - which will be in a few days."

Moncton Daily Times - Jun. 18, 1900 Curryville. - We are pleased to learn that prospects are bright for the reopening of the old Albert Mines, and hope that it may be the means of restoring the balmy days of old."

S.J. Star - Aug. 1, 1901 Capt. Henry A. Calhoun, owner of the Albertite mines property in Albert county, and Mrs. Adelia Cole of Sackville were married yesterday morning at Sackville by Rev. Dr. Steele of Amherst."

S.J. Daily Sun - Nov. 8, 1901Albert County Coal and Things. - A recent New York Herald contained a two column advertisement of theNew Brunswick Cannel Coal Co., Ltd., capital two million dollars. The prospectus states that the 'property of the company consists of 27 square miles, containing millions of tons of cannel coal of the finest grade and most superior quality', 'and in addition to the coal, 'albertite', a solidified oil of great value, is found in vast quantities.' John Byers, now living in England, late of St. John, who was manager for many years of the Albert mines, will be surprised to

S.J. Daily Sun - Apr. 22, 1902 Negotiations for the sale of the Albert Mines property, which has been owned for some years by Capt. H.A. Calhoun, have about been completed, the purchaser being John L. Peck, banker and lumber merchant of Hillsboro, and J. Nelson Smith. The property consists of the closed down Albertite coal mine, residence, etc., and about 1,400 acres of lumber area, well timbered. There is also a church building on the property. Messrs. Peck and Smith have purchased the property principally for lumbering purposes, and will conduct operations extensively the coming season."

N.B. Reporter - Apr. 30, 1902 The Albert Mines property, owned by Capt. H.A. Calhoun, have been sold to John L. Peck, Hillsboro, and J. Nelson Smith. The property consists of the closed down coal mine and about 1,400 acres of timberland. Messrs. Peck and Smith will conduct lumbering operations extensively the coming season."

Daily Sun - Jun. 23, 1902 J.L. Peck and J. Nelson Smith, the purchasers of the Albert Mines property, have a number of men at work prospecting, and it is reported a lead of the various albertite has been discovered, that is very promising. Jas. Robertson, a well known miner, has charge of the work."

Kings County Record - May 9, 1902 The property of the Albert Mines has been sold. The purchasers, Messrs. J.L. Peck, of Hillsboro, and J. Nelson Smith, Lower Coverdale, bought the property for lumbering purposes. The price paid is said to be in the vicinity of $15,000."

Codes: J8 / IDX_Names: Albert Mines;

Kings County Record - Oct. 20, 1905 Work of again prospecting for Albertite coal is now being prosecuted on the old Albert mines areas in Albert County. Some American capital is behind the developments, and a force of miners are now driving a tunnel to intercept the Albertite veins or pockets which is believed are still on the property. Should they be found again in any large body, it will mean much for Albert County, as in former years it was the cause of placing much money in circulation there, as well as making its owners wealthy."

North Shore Leader - Aug. 10, 1906 Albertite Mines Will Soon Be Worked. - Business on a Large Scale to be Resumed After A Lapse of Years. - It is expected that inside of a month's time the Albertite coal mines in Albert County will again be in active operation. Some twenty-five years ago these mines were in active operation employing over two hundred men engaged exclusively at mining work, and twenty thousand tons of coal per year was mined for a number of years. The product was valued principally on account of its remarkable gas-producing qualities, yielding as it did some fifteen thousand feet of gas to a ton, whereas other coals yield about six thousand feet. Up to a week ago the mines have been in active operation on a small scale, by a company of American capitalists, who do not actually own the property but have mining and a prospective lease of fourteen hundred acres. In the neighborhood of $4,000 or $5,000 has been spent by this company and there is now at the mine's mouth ready for shipment seventy-five tons of Albertite. City Engineer Edington has commended to the city council the purchase of forty tons for gas-making purposes. - Moncton Times."

Kings County Record - Mar. 30, 1906 Albertite Coal Mine. - The once famous Albertite coal mine at the Albert Mines, in Albert County is again being opened up. George Robinson, of Boston, has leased the property from John L. Peck, of Hillsboro, for a year or more and has for some months past been prospecting. One tunnel was pushed in about 400 feet near the surface but was abandoned. Now another tunnel reaching in about 75 feet also near the surface has located a seam. Your correspondent visited the mine a few days ago and was shown the seam which was five feet wide and has been seen down for a depth of twelve feet. Unlike most mines in this country the seams run perpendicularly instead of horizontally. The coal is a brilliant black in color and light in weight. Anthony Hawks is the foreman at present. Mr. Hawks worked eleven years when the pit was at its best and is very sanguine now as to good results. The coal is said to be the best known in the world for making gas and was worth $23 per ton. Only one place yet known has coal which even approaches it in value and that is Trinidad. It is sincerely hoped that this may prove as good as in former years so that this part of our province may be financially developed. It may be interesting to note that this mine was opened up first about 50 years ago by Peter and John Duffy, of Hillsboro, who opened it about a year and then sold out to Wm. Cairns Co. There were three hoisting shafts, each straight up and down. One was 1,460 feet, the other two 1,000 feet each. About 150 men were employed and about 70 houses were built to accommodate them. The coal was hauled by horsecarts to Hillsboro, and shipped by water to Halifax, St. John, Boston and New York. From 15,000 to 22,000 tons were shipped annually. Archibald Brown was manager at one time. Messrs. Spurr and Allison, of St. John, were also financially interested. The works closed down about 24 years ago and since that time the place has been almost deserted. About 15 years ago, Capt. H.A. Calhoun bought the whole property, consisting of a large tract now timber land. He lived there for about ten years and then disposed of the property to the present owners. James Robinson occupies the large house built by one of the managers, John Byres. Mr. Robinson was underground foreman during the last four years the pit was

Telegraph Journal - Sep. 6, 1923 Hopewell Hill. - Albert Robertson, of St. John, has been visiting his parents, Mr. and Mrs. James Robertson, Albert Mines, who have been quite ill, but are now able to be about. This esteemed pair furnish an unusual record of nearly sixty-three years of married life, the sixty-third anniversary of their wedding due in a short time. Mr. Robertson is one of the few remaining old time miners, who was long connected with the famous Albertite mine when this noted product was brought from 1,500 feet below the surface and sent to the far corners of the earth. Mr. Robertson was underground foreman for years when the 'Mines' was a hive of industry."

Kings County Record - Sep. 11, 1925 Alma. - Louis Simpson, of Ottawa, who is interested in the mining property at Albert Mines, was here last week looking over the harbor and shipping facilities."

Codes: J8 / A2 / IDX_Names: Albert Mines; Albert / Kings County Oil Shales;
Morning News - Jun. 4, 1860 In Albert County there has been considerable destruction of property. Recently a building in connection with the Caledonia Oil Works, including about 1000 gallons of oils was burnt. The Albert Coal Mine has been on fire for some weeks, so as to completely prevent working. Efforts are being made to extinguish it, but the scarcity of water is so great, that much loss, it is feared, will occur before the repairs can be commenced."

Codes: J8 / A2 / IDX_Names: Albert Mines; Albert / Kings County Oil Shales;
New Brunswicker - Jan. 8, 1863 The Caledonia Oil Works Company. - The Caledonia Mining and Manufacturing Company held a special meeting on Saturday last, with reference to resuming operations in the manufacture of Oil from shale. It will be in the recollection of our readers that this Company had to suspend their manufacture of Oil in consequence of the large discoveries of Oil Wells in Canada over a year ago; but in the mean time the demand for Petroleum Oils in all parts of the world has become so great, that the price has advanced to a point at which its manufacturer from our rich shales may again become profitable. The Report of the Directors, presented at the Meeting, contains matter of so general interest that we publish it in full, intending to refer to the subject again. The following is the Directors' Report: The Directors of the Caledonia Mining Company having learned the great increase in the price of Coal Oil, which has lately taken place, have turned their attention to the consideration of the question whether the operations of this Company cannot be resumed to advantage. They have not been able to procure sufficient information to warrant them in recommending a call being made at present for that purpose; they therefore propose laying such information as they have been able to obtain before the Company, particularly with reference to the Oil Wells and their effects upon the Oil Markets of America and Europe. From the best information which they have been able to procure, they believe that the production of Oil from the wells both in Canada and Pennsylvania is steadily decreasing; and that the difficiency is not supplied by the new wells which are constantly being bored. If this should prove to be the case, and a steady price of sixty cents can be procured for refined oil per gallon, they think a remunerative business can be done in resuming their manufacture, and that the great abundance and low prices of Petroleum which have hither to prevailed, though appearing at the time detrimental to the interests of the Company, will really turn to their advantage, by inducing a large consumption, and thereby creating a new want of the article in the European and other markets. The Directors are able to state from information obtained by Mr. McDonald on behalf of the Albert Mining Company, by visiting the wells about the 1st of October last, that the Pennsylvania wells produced in the year 1861, no less than 21,695 barrels. That although other wells have been bored during the past year, the quantity produced in 1862 has not been more than 5662 barrels, some of the oil wells having given out, and new borings having in other cases stopped the production of old wells in the neighborhood. There are wells which have not been used for some time, as the oil could not be raised without pumping, and it was thought the then prices would not be remunerative for the extra labour required. If the present prices keep up, the pumping will be resumed, producing probably an increase of 5000 barrels per year in the quantity produced. In Canada 12 wells produced in 1861 no less than 7,500 barrels per day, while in 1862 15 wells produced only 8,780 barrels, several of the old wells having given out entirely; and recent information has shown that since the 1st of October last, when this report was made, the Canadian wells have fallen off in production no less than 700 barrels per day. On the other hand we find that the exportation of Coal Oil from the United States to Europe, and other parts of the world, has increased to an amazing extent. The exports during 9 months of 1861 were 368,940 gallons, while during the same period in 1862 they were 6,294,818 gallons, or about 19 times the export of the year preceeding. The prices of Crude Oil during the past year, in New York have varied from 23 cents in January to 50 cents in November, falling during the summer months to 14 cents and even at one time to ten cents per gallon. The price of refined Oil which commenced on January at 47 cents, rose in November to $1.10. packages included, and although prices have since fallen, the last quotations give 72 cents. The high prices in November have reached the exports, and will probably keep the price down during the winter. The prices of refined Oil are quoted in London at 3s. 3d. per imperial gallon; in Liverpool at 3s. 3d. Glasgow at 3s. 3d. while in most of the continental ports, Oil appears to be in great demand. The directors instructed Mr. Barber to visit the works and report on them, and his report will now be laid before you. The directors would not be desirous of immediate operations, but from the fact that they have on hand, wood of the value of about £500 which has already been exposed for two summers, and if not used this ensuing season will be comparatively useless. They will have to consider the propriety of adopting one of several courses; first whether it will be desirable to do more than by putting on the repairs which are absolutely necessary to go on and manufacture Crude Oil for shipment to Europe; next, whether it will be advisable to refine the Oil, and if so, whether the refining can be done by a

small apparatus at the works, or by erecting a refining works upon a more extended scale in St. John. They are also turning their attention to the question whether a more economical process than the rotary retort cannot be found for extracting the Oil from the shale. They are making enquiries upon these points and also with a view of procuring some person of practical knowledge in the manufacture of the oil. As before stated they do not propose asking for a call to be made until they have sufficient information to state what sum will be required, in the mean time they do express their confident expectation that by a prudent course of management in resuming operations, the undertaking will yet be found remunerative to the Stockholders."

Codes: J8 / A2 / IDX_Names: Albert Mines; Albert / Kings County Oil Shales;
Daily Telegraph - Oct. 29, 1874 Albert County. - Caledonia and Baltimore. -Leaving the Albert Mines on the west, we take our way through the woods, in which, here and there, a short distance above the mines, are evidences of exploring operations undertaken in search of the western extension of the vein of Albertite, which has made this county famous, and been literally a mine of wealth to those who have been lucky enough to fall in with a slice of it. These works have been undertaken by Mr. Blight for an American Company, and are indicated by the closed mouths of trial shafts, isolated wooden buildings, and various mining apparatus strewed around. This western end of the vein seems harder to pick up than the Atlantic cable, and as we have already intimated, the search has not yet been attended with success. Descending into a deep valley, and gaining the opposite hill, from the farm of Mr. Isaih Milton, there is a magnificent view of the surrounding country, the Albert mines lying in a sort of basin, and beyond them, in an easterly direction, gleam the waters of the Petitcodiac. ... the road turns off to Rosevale, but continuing along the Baltimore road; we should have come to the remains of the famous oil works, which were erected by the late Mr. Archibald for the purpose of extracting oil from the shale of this region. Rose Vale, as its name indicates, is a fine, well wooded valley, running east and west, and along it lie the six veins of shale, of which thousands of tons have been taken out, although no one from passing through it now, would ever suspect it had once been the centre of a great mining interest. The shale is said to have a dip of 45 degrees to the north, and the veins are from 5 feet to 12 feet wide, improving in quality according to the depth. Most of the places where the shale was extracted are now covered in, but Messrs. W.A. Stevens and J. Stevens, postmaster, with the former of whom we remained overnight, obligingly excavated some with pick-axes for inspection. The shale is at first site something like charcoal, though far heavier, with shining pencil marks on a dull ground, the grain being like that of wood. The direction in which the veins run has a remarkable similarity to that of the Albertite. The oil from the shale could be produced at about 60 c. per gallon, and is a very superior article, and an increased demand would probably bring it into requisition, though at present it could not compete with the low-priced well oil..."

Codes: J8 / A2 / IDX_Names: Albert Mines; Albert / Kings County Oil Shales;
S.J. Daily Sun - Apr. 23, 1888 and Daily Times - Apr. 27, 1888 The Albert Railway. - And How It Grew Out of TheDiscovery of Albertite. - Some Interesting Facts in Provincial History. - (Concluded from Saturday's Sun). - As previously stated, when C.D. Archibald undertook to introduce the Albert cannelite to the gas manufacturers of Great Britain, he soon surmounted every objection, save and except that the deposits were in the interior of the country, remote from the seaboard, and could not therefore be profitably shipped. Malcolmson Brothers, of Portlaw, county Waterford, owners of the largest cotton-spinning and weaving factory in the south of Ireland (vide Fraser's Ireland, edition 1854, p.124), where upwards of 1000 people were constantly employed, were at that time also the largest manufacturers of oil from shales. Mr. Archibald secured an interview with the head of this firm, and exhibited specimens of the Albert shales, together with analyses thereof, and authenticated evidence of the extent of the deposits. Satisfied that there were millions in it, Mr. Malcolmson immediately closed a bargain with Mr. Archibald for half of the deposits for the sum of œ10,000 sterling. His next step was to send out to New Brunswick a competent mining engineer and chemist, and boring machinery to determine the depth of the shale, together with apparatus for retorting and assaying. The scientific experts reported, after careful examination, that whereas the Scotch shales only yielded ten gallons to the ton, the Albert article assayed 60 gallons, and that the Scotch shales were in thin veins, the Albert deposit aggregated 30 feet in thickness. But they likewise reported that Mr. Archibald had retained in his own name two of the most valuable deposits. Mr. Malcolmson resented this as a gross breach of faith on the part of Archibald, and indignantly refused to have anything further to do with him or his shales. The Consolidated Gas Company of London next took up the project, which included not only the mining and retorting of the shales, but the building of the Albert railway. Mr. McHenry was employed to collect data. He was a close observer and a skilful gatherer of facts. He recognized the vast capabilities of the country if developed. He had ocular demonstration of the value of its mineral resources in coals, shales and freestone. He collected ores of copper, iron and manganese which gave promise of unlimited wealth. He saw its great resources in lumber, as well as the richness of the marshes for agricultural pursuits. To stimulate into life all this dormant region needed capital and enterprise. Mr. McHenry represented the case very strongly to the London gas men. He argued that the development of the natural resources of the county; that the two enterprises were bound together as closely as the Siamese twins. About this time the railroad subsidy measure, popularly known as the Lobster Act was passed by the New Brunswick Legislature. W.H. Steeves, representative from Albert County, was after much solicitation induced to have the Albert railroad named as one of the claws. No opposition was made to the proposition, as even the mover considered the scheme altogether visionary. However, a prospectus was issued and a company formed. Mr. Archibald, who was in London, represented to the Consolidated Gas Co., that by construction of this road, not only could the vast deposits of shale be utilized, but that the productions of the county, mineral and vegetable, would make it one of the best paying lines in the world. The plan suggested by Mr.

McHenry was favorably received. Abundance of capital was subscribed. All the available mining properties were leased by Mr. Archibald, and everybody connected with the scheme looked forward to a speedy completion of the road and to active operations in mining, lumbering and agriculture. But the great financial crisis which followed the suspension of the Bank of Liverpool put an end for a time to these pleasant anticipations, and before confidence was again established in financial circles, an inquisitive savant advanced the theory that underlying the chalk on which the cannel coal was superimposed, were other beds, thicker and more valuable than those considered nearly exhausted. Extensive borings revealed the truth of this theory. The oil wells of Pennsylvania and Ontario were producing immense quantities, and the Albert shales sank into insignificance. The indications of oil in Baltimore in connection with the shales, led the Albert men to think oil might be found there, and borings were made to the depth of 600 feet, which at that time was the limit of the borings in Pennsylvania. The shale was not pierced and the project was abandoned. It is confidently believed, however, that had the borings been continued to the depth now reached in other places, oil would have been struck, as the deeper the borings went the richer and more unctuous became the shale. The immense output of the American oil wells, and the discovery of new coal fields, extinguished for a time the scheme of building the Albert railroad. Mr. Archibald was forced into bankruptcy and shortly afterwards died heavily involved. Kenneth McLea, a young worker in London, was appointed receiver. The prospectus and papers relating to the Albert railway attracted his attention. He examined into the scheme and was favorably struck with the financial feasibility of the joint work of building the line and developing the county. In the meantime, Mr. McHenry, as secretary of the Albert Railway Co., had kept it legally alive. He had succeeded by persistent effort in getting a quorum at each annual meeting. In the county he was held to be a mono-maniac. No one believed in the undertaking but himself, and it was considered a good joke to accost him with the query, McHenry, when are you going to hold another annual meeting? He was chaffed unmercifully, but held on like a bulldog. Mr. McLea, ascertaining that the company still existed and that its charter was unrevoked, set to work in earnest to boom this enterprise. Through his exertions confidence was restored, capital was subscribed and a contract entered into with Featherstone Griffin to build the road - Mr. G. to have the government subsidy, and power to issue bonds under the corporate seal to the extent of $600,000. Baron Grant, at that time a prosperous and famous London banker was to furnish the ready cash. The bonds were engaged to be taken, and everything looked as if work would be started at once on a solid basis, but after the contract was signed, Baron Grant took it into his head to seek further information, which he did through a well known New Brunswick railroad man. That gentleman having no personal knowledge of the case, consulted Hon. A.R. McClelan, furnishing him with a schedule of questions based on the company's prospectus. While Mr. McHenry very possibly overrated the advantages, Mr. McClelan, a most conservative business man, seems to have leaned in the other direction. For instance, among other things in his report, Mr. McC. represented that no hay would ever be shipped over the road, yet strange to say, when the Albert road was finally built, he sent the first carload of hay over the line. The wide discrepancy between the tenor of the prospectus and Mr. McClelan's report, led Baron Grant to withdraw from the enterprize and the contract was voided by non-compliance with its terms. When this fiasco became known, a meeting of many of the principal inhabitants of the county was held at Harvey, and resolutions were drawn up endorsing the prospectus and condemning Mr. McClelan's report as inaccurate. A report of the proceedings was forwarded to Baron Grant, but too late to avert the mischief. Confidence was destroyed, and once more the scheme fell to the ground. At the meeting above referred to, Mr. McClelan stated that in his opinion the Albert railway would never be built, unless the people of the county put their shoulders to the wheel, and at his instance a committee was appointed to devise means whereby the county might be enabled to render the necessary assistance to the road. Hon. A.R. McClelan, Alfred Steven, G.R. Smith and five others were the committeemen chosen, and they prepared a petition to the legislature praying that the general sessions of the county of Albert might be empowered to assess the sum of $100,000 towards the construction of the much needed line. At this juncture, one Mr. Smart appeared on the scene and advocated the building of a narrow gauge line from Petitcodiac through the woods to Hopewell Corner. He offered to build this road for the government subsidy plus the county bonus and endeavored to prevail on the Albert Co. to make over the charter to him. Mr. McHenry implored the committee to wait a short time longer, guaranteeing that if he did not succeed in putting the work under contract within three months, he would assist the narrow gauge scheme as far as lay in his power. In the meantime the necessary legislation had been procured to enable the county to assess for the amount required, but on a vote being taken the proposition was rejected, the parish of Elgin going solidly against assessment. Thereupon a new measure was introduced, to enable the sessions to assess the sum of $40,000 on the parishes of Hillsboro, Hopewell and Harvey, and $30,000 on the other parishes. This was adopted by the sessions. In the meantime Mr. McLea had come over to America from London, and was negotiating with Duncan McDonald, on the basis of the original contract with Featherston Griffin, but when he learned that the county was willing to give $70,000 in addition, he refused to proceed unless he got this bonus. The Albert Railway Co. closed a contract with Duncan McDonald, and on March 5th 1872, Governor Wilmot turned the first sod of the Albert railroad. Mr. McDonald was engaged in other and more extensive works in conjunction with a Mr. Cook, and finding the other operations claimed all their attention, they entered into an agreement with A.E. Killam, who took the job off their hands, made a new contract with the company and built the road, which was formally opened by Governor Tilley in 1877. After the road was completed, Kenneth McLea submitted a bill for his services as promoter and commission broker, but Mr. Killam, who had dealt directly with the company, very justly refused to recognize Mr. McL's claim. The Maritime bank which held the bonds, vainly endeavored to float them in London, and finally Mr. Killam handed the road over to the bank. When the bank wanted to unload, Mr. McLea again appeared on the scene, with a friend's assistance purchased the road, stock and bonds at a low figure, and through the instrumentality of Ricardo, a London broker, disposed of the bonds at a rate that

Morning News - Aug. 1, 1856 Oil Works. - The following extract of a letter received by the last mail from New York, will show the encouraging prospects of the New Brunswick Oil Manufacturing Company, which must be highly satisfactory to the Stockholders, who are now rebuilding the works in a most substantial manner, and expect shortly to be manufacturing oils in considerable quantities. Their oil, we find, is now used in several stores and dwellings in Carleton with great satisfaction:- New York, July 23, 1856. ""Jas. DeWolf Spurr, Esq., Dear Sir, - I have already made trial of the Oil you sent me. A Lamp I had just received from the factory made after much care for the Kerosene Co. was used to try your Oil, and the result is that your's is more free from smell and whiter, and the light more steady and more intense by far, than even the best Gas Light. I do not doubt but a large business may be done here. I have ordered the lamps made, and as soon as finished will send to you. Your's respectfully, E.V. Haugement.""""

Morning News - Jun. 13, 1856 and N.B. Courier - Jul. 19, 1856 ADVERTISEMENT: New Brunswick Oil Works Company, Capital ... £50,000 in 5000 shares of £10 each. Present paid up capital ... £17,500 Proposed addition to paid up capital . 15,000 Proposed paid up Capital upon which --dividends will be payable... £32,500 --Board of Directors-- (Provisionally appointed), Hon. John Hamilton Gray, Chairman, James DeWolf Spurr, George Flemming, Thomas E.G. Tisdale, John H. Harding, Secretary and Treasurer - John McGrath. --This company has been organized for the purpose of making Lamp and Lubricating Oils from ""Albertite."" at 3 One ton of Albertite yields by distillation and purification of the distilled product, upwards of seventy gallons purified Paraffine Oils which are divided into two classes, namely - Lamp and Lubricating Oils, each different from the other in appearance and character. Paraffine Lamp Oil stands unrivalled for its economy, cleanliness in use, and brilliancy of light. Ninepence worth of this Oil will yield as much light as five shillings worth of Burning Fluid, when both are sold at the same price per gallon. Paraffine Lubricating Oil does not thicken, gum, or become sticky, it preserves the surfaces bright and clean, and upon all slides and fast running machines it lasts longer and lubricates better than any other oil now in common use. The Company's Works are designed upon scale sufficiently large to produce 350,000 gallons of purified Paraffine Oils per annum, at a cost not exceeding two shillings per gallon, if sold for no more than an average of three shillings and nine pence per gallon, (it is presumed they will command a much higher price,) they will show a return of £30,000 per annum, for distributions to shareholders. 1500 shares of £10 each are now offered for public subscription in Class A, or six per cent. Preferred stock secured by the whole property of the Company. A deposit of £2 per share will be required to be paid upon allotment of shares and the remainder by instalments as the business of the Company may require. The Act of Incorporation, Bye Laws, Prospectus with detailed information compiled from the reports of the best authorities in England, of the working of an Oil Factory in Scotland, and from operations conducted upon a large scale at the Company's works here confirming the estimate above stated, and form of application for shares may be obtained at the Company's office, No. 77, Prince William Street. If applied for by letter, (post paid) addressed to Mr. John McGrath, Secretary. -- Form of Application For Shares. To the Directors of the New Brunswick Oil Works Company:- Gentlemen, - I request that you will allot me -- Class A, Shares of £10 each, being six per cent. Preferred Stock in the New Brunswick Oil Works Company, and I hereby agree to accept such shares or any less number for the same in accordance with the Act of Incorporation and Bye Laws of said Company. Name, -- Business or occupation -- June 6 Address -- at the name applied by Sir Charles Lyell and others, to the Bituminous substance from the Albert mines, Hillsboro', in the Province."

Miramichi Gleaner - Mar. 29, 1856 New Brunswick Oil Works Company. - Application has been made to the Legislature for an Act to incorporate this Company, and we are pleased to learn that their extensive Oil Works Establishment in the Parish of Lancaster will be immediately completed upon a scale sufficiently large to produce 350,000 Gallons Paraffine Oils, per annum. These Oils will be made from Albertite (of Asphaltum vs. Coal notoriety), the produce of the Mines of the Albert Mining Company at Hillsboro', and as illuminating or lubricating agents, they are described to be of greater value than Sperm, the most valuable of all Oil hitherto in use. - New Brunswick."

N.B. Courier - Mar. 29, 1856 Asphaltum vs. Coal. - The question whether the substance in dispute be Asphaltum or Coal, has not yet been decided - most probably because it is neither the one nor the other. Sir Charles Lyell, and Mr. Dawson, of Nova Scotia, came to this conclusion and called it ""Albertite"". The Albert Mining Company having acquired undisputed possession of the mineral in question, are now successfully mining the same for which there is an increasing demand at prices that will yield the company a very handsome profit with capital invested. [Com]"

Codes: J8 / E2 / IDX_Names: Albert Mines; Oil and Gas - Kings Co.;
Daily Morning Telegraph - Jan. 31, 1867 The Albertine Oil Works. - The manufacture of oil from Albertite for lighting and lubricating purposes was first carried on in the province by Mr. J. DeWolf Spurr, who, after having specimens of his coal analyzed in England in 1852, and being convinced of the practicability of the project, contracted for the necessary machinery there. While this was being made, he returned and commenced the erection of the buildings at Spurr's Cove (more properly speaking Milford), which were completed in 1855. Early in 1856 the manufacture of oil was commenced. In October of this year a most disastrous fire occurred, which burned the building down to its brick foundation, at the same time destroying the semi-circular iron roof with which it was covered, it having broken to pieces in falling. About this time, or shortly after, the failure of a large English firm involved Mr. Spurr in additional losses. A number of other gentlemen than became associated with him, under the name and style of the 'New Brunswick Oil Works Company', who, in 1857, erected the large building in which operations are at present carried on. The business was continued under the management of this Company until 1861, but owing to a variety of causes was not successful, the works being in that year sold for the benefit of creditors of the Company. The whole establishment was purchased by the present proprietors, Messrs. Spurr, Moore, and McGrath, who have since that period conducted the business under the name of the Albertine Oil Company. The buildings are large, consisting of the manufactory proper, the coal house, the cooper and blacksmith's shops, etc. The first of these is 160 feet long and 100 feet in width, some 50 feet high on the side next the river, and about 15 on the upper side, being built on a declevity or side hill. The factory is covered by a corrugated iron roof, galvanized, and is supported by an iron framework that rests upon the very substantial brick walls. Considerable wings are attached at each end of the main building, in which are the blacksmith's shops and the room where the chemicals are prepared for use. In the large building, and extending through its entire length - say 120 feet - is the mammoth furnace, which is about 11 feet high and 15 feet broad, and contains the retorts in which the Albertite undergoes the first process. These retorts are large iron chambers, fitted in the brickwork, and having an opening in the front of the furnace, as well as a connection with the refrigerator at the back. Under the retorts are the fire places, one under each, all of them being connected with the flue which lies horizontally along the whole length of the furnace and communicates with the large chimney at the west end of the building. From the back part of each retort, a pipe, shaped like a horn, leads down into the refrigerator, which is, in plain language, a large iron tank containing cold water; and connects with a pipe at the bottom. With this a number of tubes or pipes, some three inches in diameter and ten or twelve feet in length, and set upright, are connected, the first and second, the third, and fourth, the fifth and sixth, etc., etc., being joined by elbows at the top, the last of the number being carried up considerably beyond the rest and opening into the air. The Albertite is brought from the coal house on a car, running on a tram-road which connects and runs through the entire length of both buildings. Each load on its way passes over the large truck scales and is weighed, a sufficient quantity for charging one retort being taken at a load. The tramway passes along just in front of the retorts, the car being unloaded by a simple movement in the exact place required. The capacity of the retorts is about ten hundred weight to each - which is much larger than those in use in oil works of the United States, the fifteen here used having a capacity equal to three times as many in use there. In the process of charging the retorts the door is opened at the front, the stop-cock being closed at the same instant. The Albertite is then shovelled in with the greatest rapidity, and when the task is completed the door is closed, being made perfectly tight by the application of mortar. At the instant this is done the workman in charge calls out the number of the retort; the attendant below instantly opens the stop-cock connected with the retort named, at the same time calling out, ""All right,"" and the preparation is complete. The greatest care and exactness is here required; for, obviously, if the door, as well as the opening at the back of the retort, were kept closed at the same time an explosion would inevitably follow. The heat of the furnace separates the oily portion of the Albertite from the rest in the form of vapor, which passes through the tubes at the back into the refrigerator, and is there condensed into oil. The lighter and more volatile portion, in the form of an inflammable gas, being forced along, rises in the first of the vertical tubes, before described, above the refrigerator, and is forced down through

the second, a portion of it being condensed during each passage through the refrigerator, until having passed through the whole of the vertical pipes, the portion which was not condensed passes off into the air in a gaseous state through the last pipe of the series. In order to guard against the possibility of this gas accumulating in the building, and thus giving rise to an explosion, it is lighted and kept burning during the whole time - some fourteen hours - that the retort is charged, giving a jet of flame of two to three feet in height and of great brilliancy. In the evening and night the illumination thus produced is of the most magnificent description. The oil, as it is condensed from the vapor, passes into a receiver, where it is measured, thus giving an opportunity of ascertaining whether the retort is working well. In this manner oil is extracted from the Albertite; it is yet, however, in a crude state - unfit for use, either as a lubricating oil or for purposes of illumination. In the refining process, which is very much more intricate and complicated than that just described, the crude oil is pumped into large tanks, of which there are three, lined with lead, and having a capacity of three thousand gallons each. This is done by a rotary pump connected with the engine of the works, which operates with sufficient rapidity to fill one of the tanks with oil from the vats below in thirty seven minutes. The oil here receives certain chemical ingredients, and is afterwards distilled and undergoes a variety of processes which we shall not here attempt to describe. Some idea of the extent of the operation may be formed, however, from the fact that the oil, while undergoing the refining process, is conducted through an extent of pipe more than a mile in length! The Albertite after having the oil extracted is removed from the retorts in the form of coke, which is used as fuel in heating the furnaces. Since the year 1861 the fires have been kept continually burning day and night, without even once allowed to go out. The Coal House connected with the works is a capacious building, eighty feet by one hundred, and of a height equal to four storeys, being so arranged that the Albertite can be hoisted direct from the vessel in which it is brought from the mines, to its place in the building. Three thousand tons were laid in here for use during the present year. The Cooper shop is also a large building, being sixty feet in length by forty in breadth, and three storeys high. The casks, which are iron hooped, are here made, oak being used for the staves and heads. These require to be out together in the most perfect manner, and are coated inside with glue in order to contain the oil, which is of a very penetrating nature. The quantity of glue used in this way is very considerable, and is purchased by the Company in England, $2000 worth having been in one instance laid in at once. The works have a capacity sufficient to produce 1,000 gallons of refined oil per day, about one hundred and fifteen gallons of crude oil being produced from a ton of Albertite. The exact amount of reduction which the crude oil undergoes in the refining process we have not 11 learned. - Since 1857 some 20,000 tons of Albertite have been operated upon. The illuminating oils produced by the works was in the years 1859 and '60 sold in Canada and the United States to an amount equal to about seven-tenths of the whole produced. These oils were then admitted to those markets as crude, at a low rate of duty. In 1860 a duty of ten cents per gallon was imposed by the United States authorities; this has since been increased to twenty cents per gallon - which of course entirely excludes Albertine oil from that market. The Company have also to contend with Intercolonial duties of seven to ten cents per gallon, which operates largely against the introduction of their oils to the markets of the other Provinces. The proprietors of the works have purchased some twenty five acres of land in the vicinity of their establishment on which they are erecting, from year to year, tenement houses for the workmen to whom they give employment. Six new buildings of this description were erected during the past year; these are thoroughly finished inside, having double walls of lath and plaster, and are painted on the outside in such a manner as to give them a very neat appearance. Of the quality of the illuminating oils produced in these works it is almost needless for us to speak. The fact that they are non-explosive was satisfactorily proved at the time of the burning of the Beacon in our harbour, there being some hundreds of gallons of Albertine then in the tank, which was consumed without even the slightest explosion taking place. Their capillary power is also much greater than that of other oils in use, so that every drop of oil within reach of the wick in a lamp burning Albertine is readily consumed. - The British Government, after carefully testing the various kinds of oil submitted for inspection, directed that Albertine should be used in the Commissary Department at Halifax. Large quantities in addition to the amount required for this purpose, have, not withstanding the adverse duties, been sent to Nova Scotia, and also to Prince Edward Island and Canada. The number of persons employed at present is over sixty. Formerly more workmen were required, the making of casks engaging the attention of quite a large number. As these casks are returned to be refilled, the number of new ones required annually is very much less. The whole cost of the buildings and works of the Company is estimated in round numbers at $250,000. The operations of the Factory are conducted under the personal supervision of Mr. J.N. Moore, one of the members of the firm, who is in every way qualified for the arduous and responsible duties of the position; and doubtless to his energetic and intelligent superintendence, coupled with the

Evening Times & Star - Oct. 15, 1910 Albert Oil and Gas. - The gas and oil discoveries in Albert county are the subject of an interesting article in the Victoria Colonist, evidently from the pen of Mr. H.C. Lugrin, who was once editor of the St. John Telegraph. Noting the fact that gas and oil have been found in Albert, and that pipe lines may be laid to Moncton and St. John, the Colonist writer says:- 'It may be mentioned that twenty seven years ago the St. John Telegraph published some information it had received which in its opinion justified a thorough prospecting of that part of the province, and urged that it should be undertaken. The idea was not entertained by any one with the necessary amount of money and thus the discovery of this valuable commodity was postponed for a quarter century. This seems to prove that sometimes the alleged visionary ideas of newspapers may not be so very visionary after all. 'There was a time when Albert county was verymuch in evidence in the matter of illuminants. Some fifty years or more ago a mineral was discovered in that country that was thought to be coal. There was some keen litigation on this point, and those interested in such things will find the story in the Reports of the Supreme Court of New Brunswick. The mineral was densely black and glistening. It broke with a shell-like fracture and its edges were almost razor-like. It could be lighted with a match. As the result of the litigation a special name was devised for it and it was called Albertite. As a matter of fact it was solidified paraffine. It occurred in pockets of greater or less size. The deposits were acquired by a company of United States capitalists, and the mineral was shipped away and refined into a very high-class illuminant. The pockets were soon worked out, and as the discovery of petroleum in large quantities and its commercial utilization were announced at that time, it was not felt worth while to continue prospecting for albertite; but those who were well informed contended that there were probably many other pockets, and, as has been said above, afterwards a few people were convinced that oil and gas could both be found in quantity. The new announcement is therefore no surprise to persons familiar with the history of Albert county."

Codes: J8 / E2 / GEOL / IDX_Names: Albert Mines; Oil and Gas - Kings Co.; Geology - General;
Daily Morning Telegraph - Apr. 29, 1865 In another column we have copied an article from the Maine State Press, in reference to the geological formation of the rocks of Maine and New Brunswick. - There marks are penned in review of a lecture by Professor Hind in this city some time ago. The Head Quarters thinks that if the Province had not been in the midst of an election excitement at the time the Professor's address was given to the public, his statements, would, no doubt, have received the attention they merited. We are of the same opinion. We also heartily concur in the Head Quarters' suggestion, relative to the importance of a thorough survey of New Brunswick being ordered by the Legislature. We have urged this step on several occasions, and are daily becoming more impressed with its necessity for the full development of the wealth that lies buried in the earth in this Province. We have been much struck with the amazing apathy, arising from ignorance that prevails among our own people in regard to the mineral riches of the country. Foreigners are very much better informed on this subject than we are. A proof of this assertion is found in the fact, that, while scarcely a score of persons in the Province were aware of the existence of petroleum in Westmorland County, American geologists and chemists had examined the locality, American oil men had secured lands at Dover, and American companies had sent a large force of men, fully equipped with steam engines and the necessary apparatus, to bore for oil. It is known also that they have succeeded to a considerable extent, and fully anticipate realizing an ample fortune. The Editor of the Christian Visitor has just added his testimony to that of a number of other well informed persons, relative to the prospect for oil; and we have seen further evidence on this point from a scientific gentleman who has spent much time, money, and labor in his researches in oil districts, which is in the highest degree flattering. Writing on the subject to Sir Edwin M. Archibald, Her Majesty's Consul at New York, who is interested in oil lands in Albert, he says: ""I have been familiar with the oil regions of Pennsylvania and Virginia since the very commencement of the business, and can assure you, that, as far as surface indications are concerned, New Brunswick excels either. Oil springs, burning springs, salt springs and gum beds are numerous all along the belt to the northward and parallel with the line of upheaval across Albert and Westmorland Counties, in which upheaval asphaltum or Albert coal is found occupying a vertical fissure, the axis of an anticlinal. This oil territory, in many parts, particularly in the vicinity of the Albert Mines, bears a strong resemblance to the Virginia Oil regions. In Ritchie County, Va., they have a vertical vein of asphaltum, with a line of upheaval traceable through several counties. In the immediate vicinity of this line of disturbance the most productive oil wells have been obtained. In Westmorland and Albert counties, as you recede from the line of upheaval, the flexure of the strata becomes very gentle, lying nearly horizontal. The property which has been selected for the ""Albert Petroleum Company"" embraces some of the most valuable points in the oil territory, being fine boring ground, and easily accessible. At Steeves' Ravine is a natural Petroleum Spring, which has yielded from one to two barrels of oil daily, since the first settlement of the country. Several others are in the immediate vicinity, and at many other points in Albert, on your property, oil 7 and burning springs exist. At Fox Creek are gum beds and oil springs, and below the Church, at Memramcook are many oil shews. Territory in any part of the oil regions in this State or Virginia, with such surface indications as you have, would bring fabulous prices. Under judicious management and with proper energy employed in boring, I have no doubt that handsome dividends may be realised on your proposed capital. If we only had such territory here, [Penn.] it would be drilled like a cullender in a very short time."" These are remarkable facts and ought to be generally known. They are important in every respect, but especially important as showing the interest with the geology of the country. A thorough survey, such as Professor Hind is competent to undertake, we feel satisfied would add wonderfully to our knowledge of the mineral wealth of the Province, and lead to the opening up of a new branch of industry for our people. It is to be hoped that nothing will be permitted to

Carleton Sentinel - Oct. 13, 1860 Mineral Resources of the Lower Provinces. -- Among the specimens of the mineral wealth of the colonies, which were to be seen at the recent Industrial Exhibition at Montreal, not the least interesting and important were those forwarded from the county of Pictou. They comprised a section of the main seam of coal from the Albion Mines; a specimen of oil coal from the Frazer Mine; and a block of freestone from Acadia Quarries, which was cut in an octagon front inscribed with scriptural quotations, and between each word a Greek cross, alternately of red and yellow. The section of coal from the Albion Mines was shipped in square blocks, which when on exhibition were piled one on the other, to the height of 37 1/2 feet, showing at a glance the enormous and unrivaled depth of this wonderful deposit. Few persons even in Pictou residing within an hour's journey of the Mines, have perhaps anything like an adequate idea of the magnitude of the seam of coal from which this shaft was taken, and nothing can more correctly furnish this information

than an inspection of a solid mass of coal, cut from the vein, although it may not comprise its full extent. A sample of this description, consisting of two blocks of solid coal, each about four and a half feet in length, and two feet in thickness at the base, was shown to us the other day by Major Norton, to whom they were presented by Colonel Scott, who also forwarded the pillar which was erected at the Montreal Exhibition. They now stand in the Consul's office, where he will be happy to afford those who may desire to do so, an opportunity of inspecting them. We were shown at the same time specimens of the productions of the Albert Mines of New Brunswick,consisting of the albertine in its natural state, as taken from the mine; the paraffine; a beautiful material resembling highly purified spermacetti, and of almost alabaster whiteness; the illuminating oil; and another liquid called kerosene, of a very inflammable nature, and used, we believe, principally for extracting grease from woollen or other clothes. These were forwarded to the Consul by the Kerosene Oil Company of Portland, where the product of the Albert Mines is manufactured. It may not be generally known that the unpromising looking material known as Frazer coal, a seam of which has been worked to some extent by J.D.B. Frazer, Esq., of ....wn, produces, besides the oil now extensively used in this country for illuminating purposes, the other two substances which we have mentioned. The paraffine is manufactured into candles, which in appearance closely resembles those made from sperm, but they give a more brilliant light and in other respects are preferable to the best sperm candles. – Eastern Chronicle."

S. J. Daily Globe - Jul. 28, 1862 and Philanthropist - Jul. 31, 1862 and N.B. Reporter - Aug. 1, 1862 Great Exhibition. - Ores and minerals of New Brunswick. - No better arranged set of ores and mineral products are to be found among the colonial courts than that which is displayed by New Brunswick. The specimens, many hundreds in number, are of museum size, and neatly laid out in a series of eleven glazed cases, minutely subdivided within for the reception of each individual sample, which is numbered and named, with a reference book at the convenience of the visitor. Copper and iron pyrites, iron ore in various other combinations, such ashematite, magnetic iron ore, clay iron ore, and yellow oxide of iron, and that very useful state of the peroxide of iron, bog iron ore, are all shown in this collection. Tin and lead ores are two other very important minerals to be found here; also many specimens of building stones in red and gray granites, and very compact sandstones; a variety of green mottled serpentine, a brown carnelian, and white and red veined and white pure marble, serve to prove that New Brunswick possesses abundant material for the builder and sculptor. Gypsum, plumbago, and limestone, and above all the important substance, coal,is shown here in many highly bituminous specimens. The ""Albert coal"" of New Brunswick presents a lustrous conchoidal fracture like pith or glass, showing its highly bituminous character. It is admirably fitted for the manufacture of coal gas or paraffine. A vein of pure cannel coal, ten feet wide, has been found in Albert county. The value of the coal export is rising rapidly. In 1858 it was £13,743, and in the following year nearly three times as great. Among ornamental stones are agates, 6 jasper, garnets, and amethysts, and doubly refracting Iceland spar."

N.B. Courier - Oct. 4, 1851 Discovery of Fossil Fish in the Coal Formation of New Brunswick, by Dr. C.T. Jackson. - Dr. Jackson, in a letter to one of the editors, dated Boston, June 20th, announces the discovery of perfect specimens of fossilfish in the coal mine of Albert County, N.B., on the 5th of May last, and larger numbers on the 27th of May, and the Lepidodendra on the 6th of June. The following is cited from his letter:- ""I returned to Boston on the 12th, with numerous fossil fishes of Hillsboro', N.B., the miners having followed up my discoveries of May last, and found even better specimens than I had myself discovered on my first visit. ""You may feel interested in knowing that I have made out some of the genera, and found new species of fossil fishes, and that the Paleoniscus occurs abundantly associated with aquatic plants; also that a Lepidodendron, near if not exactly identical with the L. gracule, Br., is found with the fishes and with scattered fish scales in the same piece of the shale. Broad flat leaves like those of palms occur also in the fish shales of the coal mine and a curious blistered leaf is extremely abundant in all parts of the fish strata. These I at last traced to a stem. They appear to be a new species and remind me of our aquatic floating plant, the bladder-wort of our ponds. ""The occurrence of immense quantities of well preserved coprolites of fishes confirms the idea of Agassiz, that the heterocercal tailed fishes swam close to the bottom; for otherwise the form of such materials could not be preserved; for they were entire in the mud which ultimately enveloped them. There are herbivorous fishes associated with those that ate them and the excrements of some tell the tale that some of the fishes were cannibals! Some of the coprolites I have seen connected with the anus of the fish, appearing as if extruded by compression of the fish. Some of the fish appear to have been dead and partially putrid when they were enclosed in the strata, others evidently struggled against adverse fortune, erected their fins strongly to guard themselves from the tenacious mud which embalmed them in their last struggle. - In fact, these fishes are literally embalmed and not petrified, the bitumen which so richly charges the marly or soft clay slate or shale preserving in the most delicate manner every scale, fin, and the minutest markings; the scales retain their silvery hue slightly tinted yellowish brown by the bituminous matter."" - American Journal of Sciences, Sept.1."

Morning News - Sep. 22, 1862 and S.J. Globe - Sep. 23, 1862... - (London Morning Star of the 6th of September) - In minerals New Brunswick cannot vie with her sister colony of Nova Scotia. But within the past few years the discovery of a new species of coal or substance resembling coal has given an incentive to mineral research that promises to produce the very best results. This Albert coal, or""Albertine,"" so called from its having been found first in Albert County, has been a great puzzle to scientific men, and the source of some litigation, in order to decide what species it really belongs to. Gas Companies who had patents or charters for the sole privilege of making gas coal have instituted proceedings against parties who manufacture gas from ""Albertine"". And these defend themselves under the plea that the substance is not coal but ""asphalte"" - Scientific men from the U. States and elsewhere were summoned to decide the controversy, but one half declare it to be coal and the other asphalte. The science of the quidnunc is at fault, and the question still remains in dispute. The value of Albertine does not, however, depend on the ability of wrangling geologists to assign to it a place in the fervently incomprehensible nomenclature of their special science. The substance, whatever its name or order may ultimately be, Albertine, coal, or asphalte, is at present iluminating a large portion of the world in the form of gas or oil, producing a light that almost equals in brilliancy the light of geological science itself. Fifteen thousand tons of Albertine have been raised in a year, worth £3 per ton. During the past year a vein of pure Cannel coal, ten feet wide, has been discovered in the same country, and the mineral prospects of New Brunswick are looking up. The chief staple of the colony, however, is timber ..."

Codes: J8 / L3 / IDX_Names: Albert Mines; Beliveau Albertite and Oil / Gas;
S.J. Watchman - Oct. 22, 1875 The Belliveau Albertite and Oil Company - Ameeting of shareholders of this Company, called for purposes of organization, was held at the Royal Hotel in this city on Tuesday afternoon, which meeting, after the transaction of business, was adjourned to the following evening, when an influential representation of St. John and Westmorland businessmen met at the same place. It is understood that the following gentlemen have been chosen Directors of the Company: Hon. A.E. Botsford, Sackville; William Patrick, Esq., Maccan, N.S.; E.B. Chandler, Jr., Esq., Petitcodiac; A.E. Killam, Esq., Moncton; James Harris, Esq., Portland; Matthew Lindsay, Esq., St. John; Francis Collins, Esq., St. John. About $50,000 of stock has been subscribed, and a call of two and a half cents has been ordered, payable on or before November 16, Mr. Patrick being authorized to receive the same from stockholders. Progress was made in the adoption of bye-laws at Wednesday nights meeting, which adjourned to meet again at the date just named. The promoters of the Company claim that they have a property which answers to all the geological conditions and requirements of a fully developed Albertite mine, and in this opinion they seemto be borne out by the official of Mr. McQuat, of the Dominion Geological Staff, who has made a special examination of the locality, and forwarded to the Government a special report on the subject. Writing to Mr. William Patrick, Mr. McQuat says: I may state that the facts observed tend to show that you have at Beliveau, apparently in perfection, all the very peculiar Geological conditions under which the mineral occurs at the Albert Mine, as far as these conditions are known; so much so as to force upon the mind of the Geologist the impression that it will be strange, indeed, if Beliveau be not found to resemble the Albert property also in that particular which gives to the latter so great an economic value. Again, there are many other points which I might allude to, as for instance, your very interesting discovery of a petroleum bearing band, &c. In his report he says: Mr. Patrick passed through a portion of this band in sinking a pit 15 feet deep, and thick oil flowed in from seams in the rock in such quantities that bottles were readily filled with it. At the Albert Mine a precisely similar, and no doubt the same, band was met with at a depth of 240 feet in sinking a new shaft near the eastern extremity of the workings, and I was informed by one of the men engaged in sinking that large quantities of oil in the same thickened condition flowed into the pit. The Beliveau Mine is situated near the Beliveau Village, in Westmorland County, on the Petitcodiac River, and about three miles in a direct line from Memramcook River and the Government railway. According to Mr. McQuat's report, there are here unrivalled facilities for shipment, as a tram way of about a mile in length following a small brook shown on the plans, requiring neither cutting nor bridging, will connect the pit with the Petitcodiac, where a comparatively inexpensive wharf will serve to load vessels of any size in all conditions of the tide and wind, while a very small sum would be sufficient for the construction of a landing place where vessels could be conveniently loaded at high water. Mr. McQuat's report appears to be as candid as it is thorough and exhaustive, and is calculated to excite sanguine expectations among those who are interested in the development of the property. The Directory is a strong one, and we understand there are many names quite as good among the other stockholders, including, for instance, such as Hon. E.B. Chandler, Dorchester; Robert Milligan, Esq., St. John; Messrs S.R. Foster and Son, St. John; Robert A. Chapman, Esq., Rockland; Joseph K. Dinlop, Esq., St. John; D.B. Boggs, Esq., Joggins; Hon. A. McQueen, M.P.P., Point de Bute; Carson Flood, Esq., St. John; Edwin Fisher, Esq., Portland; Hon. Edward Willis, St. John; and others might also be named."

Codes: J8 / LEGI / IDX_Names: Albert Mines; Legislation, etc.;
Royal Gazette - Nov. 17, 1852 Cap LXXXVII An Act to incorporate the Albert Mining Company Passed 7th April, 1852 Whereas a Joint Stock Company has been formed for the purpose of opening and working Mines in the County of Albert, who have expended a large sum of money in mining operations, and in the purchase of lands, erection of buildings, and making other improvements in connection therewith: And whereas the better to enable the said Company to prosecute the

said business, it is deemed advisable it should be incorporated: Be it enacted by the Lieutenant Governor, Legislative Council and Assembly, as follows:-1. That Edward Allison, Jonathan C. Allison, David Allison, William Cairns, John Cairns, Alexander Wright, Nathaniel Gould, and James Dowie, their associates, successors and assigns, shall be and they are hereby erected into a Company, and declared to be a body politic and corporate, by the name of ""The Albert Mining Company,"" and by that name shall have all the general powers and privileges made incident to a Corporation by Act of Assembly in this Province, for the purpose of opening and working Mines in the County of Albert, and establishing all necessary works connected therewith, and for the convenient carrying on and managing the same. 2. That the first meeting of the said Corporation for the organization thereof shall be held at Hillsborough, in the County of Albert, after fifteen days notice given in the Royal Gazette, by one member of the said Corporation; provided that the corporate powers shall not be deemed to be conferred upon said Company until a majority of members present at a meeting called as aforesaid shall determine to accept their Charter. 3. The capital stock of the said Corporation shall consist of the sum of thirty thousand pounds of lawful money, to be paid at such times and in such portions as the business of the Company may from time to time require, and to be divided into twelve hundred shares of twenty five pounds each. 4. The joint stock and property of the Company shall alone in the first instance be responsible for the debts and engagements of the said Company, and no creditor or person or persons having any demand against the said, for or on account of any dealings with the said company, shall have recourse against the separate property of any shareholder on account thereof, except in case of deficiency, or when the joint stock of the said Company shall fall short or not be equal to the payment of any debt due on demand against the same, that then and in such case the goods and chattels, lands and tenements of each shareholder, shall and may be levied 3 upon and seized respectively to satisfy such debt or demand, to the extent of double the amount of the share or shares or interest of such shareholder in the joint stock of the said Company, but no more. 5. That each and every shareholder in the said Corporation shall be held liable to the said Company for each and every call or assessment made (not however to exceed in amount the stock so subscribed for) for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, or to carry on the operations for which the said Company is incorporated, and shall and may be sued for by the said Corporation, and recovered in any Court of Record within the Province. 6. So soon as the capital stock shall have been paid in and expended for the purposes of this Corporation, it shall and may be lawful for the said stockholders, at any general meeting to be for that purpose called, to increase the said capital stock from time to time, in such sums as they may deem expedient, to a sum not exceeding one hundred thousand pounds, and they shall have power from time to time to increase the number of shares accordingly, or from time to time to assess such increase upon the original number of shares, or to increase the capital by both assessments and increase of shares. 7. The Company shall have the power to levy and collect assessments upon the shares from time to time, of such sums of money as may be deemed necessary for carrying on the business of the said Company; and whenever any assessment shall be made by the stockholders of the Company, it shall be the duty of the Treasurer to give notice thereof in a Newspaper printed and published in this Province, and also in the Royal Gazette, requiring payment of the same within thirty days; and if any stockholder shall neglect or refuse to pay to the Treasurer the amount of such assessment upon his shares at the time prescribed, it shall be the duty of the Treasurer to advertise all such delinquent shares for sale at public auction, giving at least thirty days notice of the time and place of sale; and all shares upon which the assessment is not then paid, with interest from the time such assessment became due, shall be sold to the highest bidder, and after retaining the amount of such assessment and interest due on each share, and the expense of advertising and selling, the residue, if any, shall be paid over to the former owner, and a new certificate or certificates of of the shares so sold shall be made out and delivered to the purchaser; provided always, that no assessment shall be made except by a vote of the stockholders and a majority of all the shares. 8. If at any time it shall be deemed necessary by the said Corporation, their agents or servants, to enter upon the estate, lands or grounds, being the private 4 property of any person or persons, for the purpose of carrying on their mining operations, they shall allow to the owners of such lands such reasonable compensation, by way of rent or otherwise, as may be agreed upon, for the damages such owner may sustain by reason thereof, and if the said Corporation shall not be able to agree with such owner or owners of the soil, as to the amount to be paid to the said owner or owners, for the damages he or they may sustain in consequence of such mining operations being carried on upon his or their land, then such compensation and satisfaction shall be determined by three disinterested arbitrators, one to be chosen by the said Corporation, and one by the owner or owners, occupier or occupiers of the private property in question, which two arbitrators so chosen shall choose a third arbitrator, and in case of their not agreeing in such choice within ten days after their appointment, then and in such case it shall and may be lawful for the Lieutenant Governor or Administrator of the Government for the time being, upon the application of the said Corporation, to appoint a third arbitrator; and the award of the said arbitrators, or any two of them, shall be final and conclusive in the matters referred to them; and in case any of the owners or occupiers of such private property shall decline making any such agreement or appointing such arbitrator, then and in every such case the said Corporation shall make application to the Supreme Court, or any Judge thereof, stating the grounds of such application, to issue a writ or warrant in such form as the said Court or Judge may prescribe to the Sheriff of the County of Albert, or in case he is interested, then to one of the Coroners of the said County, and in case the Sheriff and Coroners are all interested, then to some person or persons, commanding such Sheriff, Coroner, person or persons as the case may be, to summon and empanel a Jury of five freeholders with within the said County, who may be altogether disinterested, and do not reside within ten miles of the land in question, which Jury upon there oaths, (all which oaths, as well as the oaths to be taken by any person or persons who shall be called to give evidence in the matter, the Sheriff, Coroner, or person or persons summoning such Jury, is hereby empowered to administer,) shall inquire, ascertain, and assess the distinct sum or sums of money or annual rent to be paid as the amount of compensation and satisfaction for the damages that may and shall be sustained by such owner or owners, occupier or occupiers of such private property as aforesaid; and the inquisition, award or verdict of such Jury shall be returned and filed in the office of the Clerk of the Pleas of the said Supreme Court, shall be final and conclusive between the parties; which amount so assessed as aforesaid, and the costs and expenses of such proceeding to be taxed and allowed by the said Supreme 5 Court, shall be borne by the said Corporation, and shall be paid within thirty days after the said inquisition, award or verdict shall be filed as aforesaid, and until such payment shall be made the said corporation shall not be entitled to enter upon the said land, and in case an annual rent shall be awarded, unless such rent is paid within thirty days after it falls due, the power to enter under the said award shall be deemed to be annulled and discontinued. 9. Before the said Corporation shall contract any debts, a certificate shall be filed in the Office of the Secretary of the Province, verified by the oath of the Secretary or other principal officer of the Corporation, which oath any Justice of the Peace is hereby authorised to administer, to the effect that the sum of eight thousand pounds has been actually paid and expended for the purposes of the said Company, and unless such certificate be filed in manner herein directed, within three calendar months after the acceptance of this Charter, the corporate powers hereby conferred shall cease and become of no effect. 10. Nothing in this Act contained shall be construed to interfere with or compromise in any way the rights of the respective parties between whom suits are now pending for any matter, cause or thing which has happened or been committed before the passing of this Act, anything herein contained to the contrary notwithstanding. 11. Notwithstanding the provisions of the eighth section of this Act, the power and authority and provision contained in the said section, to enable the said Corporation to enter upon private property, shall only be deemed and taken to extend to the tract of wilderness land of one square mile, comprised in the lease or license from the Crown made under the Great Seal of this Province to Peter Duffy and John Duffy, bearing date the eleventh day of January one thousand eight hundred and fifty, and registered in the Office of the Secretary and Register of this Province on the twelfth day of January one thousand eigth hundred and fifty; nor shall this Act come into operation or be in force until Her Majesty's Royal approbation be thereto first had and declared. [This Act was specially

Royal Gazette - May 31, 1854 Cap LXIV. 18 An Act to incorporate the Asphalte Mining Gas Company. Section Section. 1. Corporation, how 2. Office for business, constituted where to be kept. Passed 1sy May 1854. Whereas Theophylait Southerwaite, Eugene Legal, William B. Deen, Horatio Eagle, Frederick W. Cooledge, Laurent Delmonico and others, have formed themselves into a joint stock Company in New York, in the United States of America, under the title of ""The Asphalte Mining and Kerosene Gas Company,"" for the purpose of mining asphaltum, asphalte rock, and other minerals, the manufacture of illuminating, gas, burning fluids, &c., and for the manufacture of mastics, cements, and hydraulic concretes; Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The persons so formed into a joint stockCompany in New York, in the United States of America, as set forth in the Preamble to this Act, are hereby declared to be incorporated under the style of ""The Asphalte Mining and Kerosene Gas Company,"" and shall have all the powers and privileges made incident to a Corporation by Act of Assembly in this Province, for the purpose of mining asphaltum, asphalte rock, and other minerals, the manufacture of illuminating gas, burning fluids, &c., and for the manufacture of mastics, cements, and hydraulic concretes. 2. The said Company shall keep an office at Dorchester, in the County of Westmorland, and an Agent there for the transaction of business connected with the Corporation in this Province, service upon whom of all processes, notices, and other documents, shall be deemed sufficient service upon the said Corporation."

Morning News - Feb. 27, 1856 Mr. Gray presented a petition from the Albert Mining Company praying that an Act may pass to amend the Charter of said Company. The Bill in relation to the same being also presented was read for a first time."

Royal Gazette - Apr. 2, 1856 Cap. VIII. An Act to amend an Act intituled An Act to incorporate the Albert Mining Company. Section. Section. 1. New division of capital 5. Act 15 V, c. 87, s.4 stock authorized. Repealed. 2. Disposal of shares to 6. Issue of preference pay debts. Shares authorized. 3 3. Issue of shares 7. Act not to prejudice unlimited. Rights. 4. Responsibility for debts. Passed 26th March 1856. Whereas the Capital Stock of the Albert Mining Company has, under the powers of the sixth Section of the Act of Assembly of this Province by which the said Company was incorporated, been increased to one hundred thousand pounds, divided into four thousand shares of twenty five pounds each; a number of which shares, on which ten pounds per share assessment has been paid in to the said Company have been issued, and are now held by the shareholders thereof; And whereas it is the desire of the shareholders of the said Company that the said Act of Incorporation should be amended in several particulars:- Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The said Albert Mining Company shall have the power to accept from the shareholders thereof, a surrender of the twenty five pounds shares on which ten pounds assessment has been paid to the Company, and to make a new division of the said capital stock into ten thousand shares of ten pounds each; and to issue one of such new ten pound shares to each shareholder for and in lieu of every twenty five pound share on which such ten pounds assessment has been paid; and such new ten pound share shall be liable to no further call or assessment. 2. The residue of such new shares of ten pounds each may be issued and sold from time to time by the Corporation as full paid up shares, for the purpose of enabling the said Corporation to pay its debts and engagements, or to carry on the operations for which the said Company were incorporated. 3. Whenever four thousand one hundred shares of such new ten pounds full paid up shares shall be actually issued by the Company and held by shareholders thereof, no further sale or issue of shares shall be made, unless authorized by a vote of two thirds of the issued stock of the said Company at a special or general meeting of shareholders. 4. The joint stock and property of the said Company shall alone be responsible for the debts and engagements of the said Company. 5. Section four of the said Act of Incorporation is hereby repealed. 6. The shareholders may at any public meeting, by a vote of two thirds of the issued stock of the said Company, direct the issue of shares of the said Company, not exceeding one thousand, to be deemed and treated as shares entitled to receive out of the net profits of the said Company a dividend of six pounds per centum per annum thereon from the date of their issue, before any division of the profits of the said Company shall be applicable to the other stock issued and held by the shareholders thereof; such preferred shares to be subject to such terms and conditions as the shareholders authorizing said issue may impose. 7. Provided always, that nothing herein contained shall impair or prejudice the rights or claims which any person now has against the said Company, or its property, or the shareholders thereof, or any of them."

Royal Gazette - May 9, 1860 Cap. LXXII. An Act to enable the Prince of Wales Coal Company of the County of New York, State of New York, to hold property in this Province. Section. Section. 1. Company authorized to 2. Company to keep an hold real and personal Office and Agent in estate in Albert and Hillsborough. Westmorland for certain purposes; limit. Passed 9th April 1860. Whereas Albert G. Allen, Lyman W. Gilbert, James A. Alexander, and James Blight, have formed themselves, 10 with their associates, successors, and assigns, into a Joint Stock Company, in the County of New York, State of New York, in the United States of America, by the name of ""The Prince of Wales Coal Company,' for the purpose of carrying on Mining and Manufacturing operations in this Province, and are desirous of being enabled to hold real and personal property in this Province, as such Company, for the purpose aforesaid;- Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The Prince of Wales Coal Company of the County of New York, in the State of New York aforesaid, and their successors, shall and may by that name have full power and lawful right and authority to have, hold, own and enjoy in any way, real estate and lands of all kinds in the Counties of Albert and Westmorland, for mining and manufacturing purposes in this province, whether in fee simple, or by lease, or in any other way; and to have and to hold personal estate of all kinds in the said Counties of Albert and Westmorland in this Province, in any way, and to alienate, encumber, lease, sell or deal with the same in any manner; provided always, that the real estate so owned by the said Company shall not at any one time exceed in value the sum of twenty thousand pounds. 2. The said Company shall keep an Office in Hillsborough, in the County of Albert, in this Province, and an Agent there for the transaction of business connected with the Company in this Province, service upon whom of all processes, notices, and other documents, shall be deemed sufficient service upon the said Company."

Moncton Daily Times - Apr. 8, 1882 Legislature. - An Act to amend an Act intituled An Act to incorporate the Albert Mining Company, and to provide for winding up the affairs of said Company."

Daily Telegraph - May 28, 1882 Royal Gazette - May 31, 1882 Albert Mining Company. -- Winding Up Notice. In pursuance of the provisions of the Act of the Legislature, notice is hereby given, that the Presidentand Directors of the Albert Mining Company will, on the expiration of two months after the first publication of this Notice, sell and dispose of all the Real and Personal Property of said Company, and all Mining Leases and Mining Licences belonging to the said Company, as follows:- 1st. The Lands and Premises, with the Buildings thereon, of the said Company, situate in the Parish of Hillsborough, County of Albert, being the Lands on which the Pits opened by such Company are, consisting of about 1,300 acres, more or less. 2nd. The Tram-road leading from said lands to the Wharf of the said Company, at Petitcodiac River. 3rd. The Wharf Property of said Company, on Petitcodiac River, in Parish of Hillsborough. 4th. Two detached pieces of Land in said Parish of Hillsborough, consisting one of 4 and one of 5 acres. 5th. The Steam Engines, Plant, and other personal property of the said Company. For particulars, apply at the Office of said Company, 130 Prince William Street, Saint John, N.B. Dated Saint John, N.B., 25th May, A.D. 1882. Henry Gilbert, President Albert Mining Company."

Daily Telegraph - May 28, 1882 Royal Gazette - May 31, 1882 Albert Mining Company. -- Winding Up Notice. Pursuant to provisions of the Act of the Legislature, notice is hereby given to all persons or person, or Corporate body, having any claim against The Albert Mining Company, to render their respective accounts and claims, duly attested, at the Office of the said Company, in the City of Saint John, within the period of six months from the time of the first publishing of this notice. Under said Act, all Creditors of said Company who shall not hand in their respective claims, duly attested, within the period of twelve months of the publishing of this notice, shall be respectively debarred from any participation in the proceeds of the sales of the Property of the said Company, and shall have no claims, either at law or at equity, against said Company. Dated this twenty fifth day of May, A.D. 1882. Henry Gilbert, President Albert Mining Company."

Codes: J8 / S5 / IDX_Names: Albert Mines; Albert County Coal (some Albertite);
N.B. Courier - Sep. 28, 1850 and St. Andrews Standard - Oct. 2, 1850 Mining Information. - From Albert we hear that a very rich seam of the asphaltum or pitch coal is being worked in Hillsborough, on the land of Mr. Duffy. The vein is twelve feet in thickness, but is only worked to a width of eight feet, and seven feet in height. This valuable working is in a ravine in the forest, about four miles from Edgett's Wharf, on the western bank of the Petitcodiac, about twelve miles below the Bend. It is reported that a seam of bituminous coal, 17six feet in thickness, has been found on the Shepody River, by Mr. Smith, the Agent of the General Mining Company in Nova Scotia, and that preparations are making for working it on an extensive scale. In addition to its great agricultural capabilities, the County of Albert appears to abound in mineral wealth; and if half

what is said be true, it will certainly prove one of the richest and most valuable portions of New Brunswick."

Daily Transcript - Jul. 23, 1894New Brunswick Coal. - One Hundred and Fifty Million Tons in the Fields - No Money in Mining Now. - Mr. C.O. MacDonald, writing in the Cape Breton Advocate, of the coal fields of New Brunswick, says:- In stating that I do not know much about the coal of New Brunswick, I am expressing the sentiments of many others interested in the economic features of Canadian coal. The fields have not been successfully defined so far, and conjecture is invariably introduced into any discussion of this coal. It is not easy to get the output in this province, but it certainly is small. The area of rocks thought to be more or less coal bearing exist practically in the shape of a triangle. The northeast arm runs to the coast at or near Newcastle, the other to the head of the Bay of Fundy, while the base of the triangle is the coast line between these points. An estimate of the quantity of coal contained in this stretch of territory is necessarily based as hinted above on conjecture. One attempt has been made and the quantity put down as some 150,000,000 tons of coal, but this must not, under any circumstances, be accepted as established. The seams so far as exploited are low, and I do not remembered of hearing of any section thicker than three feet. A native of northern New Brunswick has informed us that he has burned coal from seam and found it quite equal to Sydney coal, with less smoke. As might have been expected, the greater prominence which Nova Scotian coal has lately attained has increased the interest already taken in New Brunswick coal, but it does not appear that much development has been done. The annals of New Brunswick coal are attached more especially to the miningof the mineral called Albertite. This may not be termed a coal. It does not lie in seams or beds like bituminous, anthracite, or lignite coal. It is none the less a mineral, of an origin similar to that of coal. It lies in cracks and fissures of the strata, into which it has probably been infiltrated by the laws of gravitation, while in a fluid or semi-fluid state. The extent of the deposits are thus largely controlled by the size and dimensions of the cracks or fissures in which it reposes. At times large blocks of the mineral have been encountered, but these seem eventually to have contracted, narrowed away and become excessively small. Comparatively large sums of money have been expended in prosecuting mining operations in this mineral. Its value is, however, much reduced by the greater development of American and Canadian allied minerals. Notwithstanding this, the deposits are still prospected with a view to development, but rather, I suspect in a half-hearted manner. Soft coal is mined principally in the winter months, I believe, in Queens county and shipped from Newcastle to the local markets. It is stated that the severity of last winter prevented the operatives from taking as much out as usual. In the spring of 1893, says the report, when the snow went off there were between 15,000 and 16,000 chaldrons of mined coal at Newcastle awaiting shipment, while this spring there was not over 10,000. As the mines are from three to five miles from the wharf the coal has to be hauled that distance, and it is taken out of the pit in the winter when the men have little else to do. Looking at the coal industry of New Brunswick, whether albertite or soft coal is mined under present circumstances, there is little money in it, and for this reason it is ignored by the practical capitalist. The province is supplied from the United States, Cumberland, Pictou and Cape Breton

These specimens are said to resemble the Pictou coal. Examinations are being made and we will give the result in our next issue. Mr. Cookson's farm is situated on the road leading to Oak Bay, about three miles from

S.J. Daily News - Jul. 23, 1869 COAL IN CHARLOTTE COUNTY. - The St. Andrews Standard says:- ""We learn that Ralph Cookson while ploughing this week, struck upon a what he supposed was a ledge of black slate, but which turned out to be coal; some lumps were brought into Town, and burn with great clearness. These specimens are said to resemble the Pictou coal. Examinations are being made and we will give the result in our next issue. Mr. Cookson's farm is situated on the road leading to Oak Bay, about three miles from this Town."" The presence of coal in Charlotte County has been long ago propounded, not only in the neighborhood spoken of but at L'Etang and also in the Parish of Pennfield. An eminent geologist many years since when visiting that part of the country stated that under fields producing but scanty crops there lay rich beds of coal which would at some future day be developed and pour wealth into the coffers of the owners of the soil. One tract lying close to a creek up from Beaver Harbor he pointed out as indicating the presence of coal of a rich quality, and lying so close to salt water possessed advantages which a mine found at a more inland station could never obtain. Perhaps our Provincial geologists will look more closely into the matter, that if such carboniferous deposits exist they may speedily be turned to good account."

Eastport Sentenil - Jan. 3, 1877 A seam of coal has been found on the farm of Albert Greenlaw, near St. Andrews. It is of good quality, and investigations are to be made to see to what extent it abounds."

Codes: K5 / IDX_Names: Charlotte County Coal;
S.J. Globe - Sep. 24, 1898 and St. Croix Courier - Sep. 29, 1898 St. Stephen, Sept. 22. - Scattered lumps of coal found at several places near St. Stephen have from time to time aroused the hopes of seekers for hidden mines. These pieces have usually been found on or near the surface of cultivated fields, where they might have been placed by human agency, and but little attention has therefore been paid to them. Now, it is said that a piece has been found eighteen inches beneath the surface, in soil that had never been disturbed, and those who have heretofore looked for a coal bed in this region are taking a new interest in the matter."

St. Croix Courier - Mar. 29, 1906 and St. Andrews Beacon - Aug. 9, 1906 Coal Mining in Charlotte. - Charlotte county may shortly develop into a coal mining region to rival the Queens county fields. Coal prospectors have been at work for some time, and one promising spot has already been negotiated for. This is on Norman McLeod's farm, which is situated about four miles from Gaspereaux Station. The men who are interested in its development are from Fredericton, and they have the ground leased from Mr. McLeod for a term of years. They are to commence boring and digging shortly with a view to investigating the extent of the coal area, and the quality of the product. The outcroppings, which are numerous are of a good quality of soft coal, and a grade similar to that produced in the Queens County mines. - Globe."

Jun. 1925 - Copied from: St. Croix Courier - Jun. 23, 1955 30 Years Ago. - Ambrose Blaney, a veteran farmer from Little Ridge, was in town Wednesday with a finesample of anthracite coal that he unearthed from a gravel pit on his farm."

Codes: L1 / J8 / IDX_Names: Saint John Graphite; Albert Mines;
Novascotian - Jul. 7, 1851 and Morning News - Aug. 6, 1851 Nova Scotia and New Brunswick Minerals. - The following is from the supplement to the ""Illustrated London News"" of the 24th ult., in reference to some of the valuable minerals of these Provinces, sent to the Great Exhibition. ""In the same Colonial Court as that in which wesee the production already referred to, will be found specimens of Asphalte, from New Brunswick and a quantity of plumbago, or black lead from St. John, in the same colony. The latter is not of such a quality as to possess value for the higher purposes for which the material is required; but it is quite sufficient for machinery and for household use. It is flaky and of good color; but wants compactness. Not far from these specimens will be found some interesting minerals from Nova Scotia ... Mr. Archibald..."

Morning News - Sep. 20, 1852 and Miramichi Gleaner - Sep. 25, 1852 Sir Charles Lyell's Opinion of New Brunswick. -This eminent Geologist, now in New Brunswick, has visited some of the districts of Westmorland, and other parts of the Province - and we are gratified to learn that he expresses a highly favorable opinion of the geological features of this country, so far as his observations have extended. We understand that he is unable to decide the question of the Lawyers, as to whether the substance found in Albert, in such abundance, comes under the cognomen of Coal, or Asphaltum, as its character differs from both. It being a new thing to science, Sir Charles is puzzled to know, on first examination, what to callit. When in St. John he visited the black lead, or plumbago mines, at the Falls, and remarked that Anthracite coal would yet be found in that vicinity, immense beds, as this plumbago was but the outer corruscation of the treasure within. We hope the company will keep on digging until they strike a vein, and their fortunes are made. In the opinion of Sir Charles Lyell, this Province abounds in mineral wealth - such as coal, copper, &c. &c. - which will one day be explored and developed to the enrichment of the inhabitants. It requires but enterprise and capital to bring about these ends. Opinions from such a quarter, cannot be over estimated. If Professor Johnston was capable of giving our Agricultural capabilities a good character, professor Lyell will assist us in the mineral kingdom. We hope yet to hear from him, under his own hand. No doubt he will write a treatise upon what he has seen and approved of, 9 in this Province. That alone will do us an immensity of good. We are informed that Sir Charles Lyell and our Lieutenant-Governor were schoolmates. In company with Lady Lyell he intends to make a journey to the Rocky Mountains for Geological research, and the pleasure which the prosecution of science affords him. We hope when he returns to England he will give New Brunswick as good a name as he may think it deserves. - St. John Morning News."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Daily Telegraph - Nov. 27, 1874 Asphaltum. - E.B. Chandler, Jr., Esq., has been prospecting for some months in the upper part of Dorchester for a continuation easterly of the asphaltum veins of the Albert Mines, and has discovered excellent indications of its presence on the Petitcodiac, two miles above the Budroe Quarries, in the strike of the Albertite. The formation is the same as that in which the Albertite exists; oil makes its appearance in the soil and surface of the brooks, and the article itself has been found in small veins, a specimen of which is on our table. Several scientific gentlemen, who have examined the district, consider the prospects very encouraging. It is proposed to form a company and develop the

Daily Telegraph - Aug. 27, 1875 A New Albertite Company. - Mr. E.B. Chandler, Jr., and Mr. Wm. Patrick of Maccan N.S., the latter a practical miner, as well as a good geologist, have they believe, found the true Albertite at Beliveau, Westmorland County. Mr. McOuat, one of Mr. Selwyn's geologists, is of the same opinion, and the facts which e gentlemen submit deserve consideration. These gentlemen offer the stock to our citizens, and held a meeting at the Royal

Hotel, to-day, to give information on the subject. The meeting will be called to order at 3.30 p.m., and it ought to be attended by persons interested in the industrial development of the country The Albertite is a natural mineral development, the great value of which is well known."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
S.J. Daily Telegraph - Aug. 28, 1875 The Albertite Mining Project. - Mr. E.B. Chandler, Jr., and Mr. Patrick met several gentlemen at the Royal Hotel, yesterday afternoon, and as mentioned in yesterday's Telegraph, placed before them the nature of their project. The mining controlled by them is situate between the Petitcodiac River and the Memramcook, directly east from the celebrated Albert mine. Mr. Patrick explained the geological conditions applicable to the Albert mines, going into details, as to the shales, fossils, etc. He also explained the theory of the deposit and showed that the conditions under which Albertite should be found were all present, in their area, while, on the other hand, these conditions have never before been realized, except in the case of the existing Albert mine. He explained also, very convincingly, why it was improbable that the mineral should be found near the surface, though under circumstances of peculiar upheavals, such might be the case. Specimens of the shales, fossils, and also of the petroleum on the spot, were exhibited; as well as small pieces of Albertite. The true vein has not been found; if it had been there would have been no need to offer the public a share in the speculation, but Mr. Patrick held that the indications were so good as to make it seem morally certain to a geologist or mining engineer that the precious deposit was at the place indicated. Mr. Chandler read from a report made to Mr. Selwyn, director of the Canada Geological Survey, by Mr. McOuat, one of his assistants, a report in which Mr. Patrick's views were fully sustained. Several gentlemen, including Mr. Byers, Mr. J.L. Dunn, Mr. Foster, Mr. Goodwin and others asked questions which were frankly answered by Mr. Patrick. We should judge that a very favorable impression was produced as to the legitimate character of the project, though there were, probably, differences of opinion as to the financial conditions proposed by the promoters."

S.J. Daily News - Nov. 17, 1875 The Belliveau Albertite and Oil Company held an adjourned meeting yesterday afternoon at the Royal Hotel. Senator Botsford, Sheriff Botsford, E. Chandler, A.E. Killam and Wm. Patrick; Esqs. were among the representatives from Westmorland present. The St. John stockholders were fairly represented. The first call of 2 1/2 per cent. on the subscribed stock was paid in by all present, the by-laws taken up and discussed, a resolutions passed fixing the time within which active mining operations would be commenced, and the quantity of stock required on the list to warrant a start. The first of July was named as the starting period. Failing to commence at that period the Directorate are required to refund the stockholders all monies paid in. After three hours session, the meeting adjourned to meet this

S.J. Daily News - Nov. 18, 1875 The Beliveau Albertite Coal Company held adjourned sittings yesterday forenoon and afternoon. A code of Bye-laws was adopted and resolutions regulating the society's operations, the division of profits, the conditions on which membership privilege can only be exercised, etc. were adopted. The by-laws stipulate that every share-holder shall have a vote on every share up to 50 shares, and one vote for every ten shares over fifty, and that no individual shall have the right to vote on more than 250 shares of stock. The proprietary shares and the subscribed shares are to have an equal interest in the profits of the company regardless of the extent to which the latter may be taken up. So soon as a seam of coal is struck the stock list will be closed; this precaution is to prevent an improper use of unsold shares. Provision was made for the banking of all monies collected and authority was given to the Directors to secure such an amendment of the Charter from the Legislature of New Brunswick as would make unalterable, except by legislation, the limit for the share-voting power and to receive for the company the transfer of the mining property held by individual shareholders. The position of the company as now organized is excellent, and the prospects if the opinion of scientists is worth anything, are favorable for a handsome return."

Morning Freeman - Nov. 18, 1875 The Beliveau Albertite and Oil Company is organizing, and 2 1/2 per cent. has been paid up on all the subscribed capital. The shareholders are sanguine of success."

S.J. Watchman - Nov. 20, 1875 The Beliveau Albertite and Oil Company have had several meetings during the week. The assessment of two and a half per cent on the subscribed stock was generally responded to. Bye-laws were adopted, and other business of the Company received attention; the shareholders being unanimous in all their decisions. As already stated, the mining operations of the Company will be commenced when twelve hundred shares of stock have been subscribed for, representing $120,000 and a considerable proportion of this amount, more than one half, has already been taken. The agreement between the promoters, Messrs. Chandler and Patrick, and the Company provides that the former shall have paid up shares to the extent of one-half of the stock and to have one-half of the profits (if any) arising from the operations of the Company. To protect the interests of the holders of subscribed stock, an amendment of the Act of Incorporation is to be obtained which will provide that the voting power of shares shall be as follows: A vote for every share up to fifty shares, after which one vote for every ten shares. The Directors met and elected Hon. A.E. Botsford, President; E.B. Chandler, Esq., Secretary. William Patrick, Esq., is Treasurer pro tem, and authorized to receive subscriptions for stock and collect a payment thereon of two and a half per cent. The Directors are Hon. A.E. Botsford and E.B. Chandler, Jr., Matthew Lindsay, S.R. Foster, William Patrick and Francis Collins, Esquires. It is understood the claims of the Company on capitalists and others interested in developing the mineral resources of the Province, will presently be laid before the public."

S.J. Daily News - Nov. 20, 1875 The Beliveau Albertite and Oil Company. - The following gentlemen form the Directors of the Belliveau Albertite and Oil Company:- Hon. A.E. Botsford, Sackville, President; Andrew Lindsay, (St. John), Francis Collins, (St. John), A.E. Killam, (Moncton), William Patrick, (Maccan, N.S.), E.B. Chandler, jr., (Petitcodiac), S.P. Foster, (St. John). Mr. Patrick is Treas. pro tem; and Mr. E.A. Chandler, Secretary."

Morning Freeman - Nov. 25, 1875 The Beliveau Albertite and Oil Company elected Hon. A. E. Botsford, E.B. Chandler, Jr., Matthew Lindsay, S.R. Foster, William Patrick and Francis Collins, Esquires, directors. And the Directors elected Hon. a.E. Botsford, President; E.B. Chandler, Esq., Secretary. William Patrick, Esq., is acting treasurer."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Morning Freeman - Oct. 16, 1875 Albertite. - Mr. McOuat, of the Dominion Geological Survey, says that all the very peculiar Geological conditions under which the mineral occurs at the Albert mines, as far as these conditions are known, exist also at Beliveau, where Mr. Chandler and Mr. Patrick believe that a large deposit of this precious Mineral will be found."

S.J. Watchman - Oct. 16, 1875 Belliveau Albertite Mine - A meeting of the shareholders of this Company will be held at the Royal Hotel, next Tuesday afternoon, at 3:30 o'clock, for the purpose of organizing the Company."

S.J. Daily Telegraph - Oct. 26, 1875 The Belliveau Albertite and Oil Company has been organized with the following Board of Directors: Senator Botsford, William Patrick, E.B. Chandler, Jr., James Harris, Matthew Lindsay and Francis Collins; and a first call made on the subscribed capital."

Daily Telegraph - Aug. 18, 1876 Beliveau. - The directors had a meeting last Thursday at Moncton, and decided to abandon the work of sinking a shaft for the present, and commenced boring. This step has been taken on the recommendation of Prof. Ells, of the Geological Survey, who has been making an examination of the Albertite formation. Mr. Ells' opinion is, that a thorough test can be made at a cost not exceeding $6,000 (which would include the cost of a borer), and the work will be done within a comparatively short time. By boring, the formation can be tested to a depth of 700 feet, whereas the company did not contemplate sinking over 500 feet, and then drifting. The company will probably ask for tenders for the

Daily Telegraph - Jul. 8, 1876 Beliveau, Albertite and Oil Company. - There will be a special train from St. John to Memramcook, on Tuesday next, at 7 o'clock a.m., enabling persons interested in this property to attend the annual meeting on that day, at Belliveau. There will be teams in attendance in Memramcook to receive passengers. The return train will leave Memramcook at 6 o'clock p.m., reaching St. John about 10 p.m. Fare, going and returning, not to exceed $2; the trip is open to any gentleman wishing to spend a pleasant day or visit the property."

S.J. Daily News - Jul. 10, 1876 Excursion to Belliveau.- The annual meeting of the Belliveau Albertite and Oil Company, will be held tomorrow at Belliveau, and an excursion train for Memramcook leaves at 7 to-morrow morning, carriages receiving excursionists at the depot and conveying them to the scene of operations. The excursion is open to any one."

S.J. Daily News - Jul. 15, 1876 The Beliveau Albertite and Oil Company's Meeting.- From the Sackville Borderer. - The annual meeting of the Beliveau Albertite and Oil Company took place at the office of the Company in Beliveau Village, on Tuesday, the 11th inst. After a brief inspection by the stockholders of the shaft, engine and properties generally, the business of the meeting was commenced and the report of the Directors read; and from the same and acts submitted it appears that the Company have, up to the present time, expended for plant, labor, salaries, &c., in the vicinity of $4,000, and the number of shares sold to date has been 1279. On this the first call of 2 1/2 per cent has been fully paid and the second call of 2 1/2 per cent also paid, with the exception of about $1,000. When this amount is paid into the hands of the Treasurer the Company, after paying all back dues and June wages, &c., will have a surplus of some $2,000, or more, on hand, thus attesting to the economy and ability of those immediately concerned in the operation of developing the property. For the protection of the present stockholders and to prevent any monopoly of stock which some persons seemed to fear, a resolution was passed to the effect, that in future all shares sold were to be submitted to the Directors for their confirmation before being entered on the regular stock book. The following gentlemen were then elected Directors for the ensuing year: Hon. A.E. Botsford, Sackville; Matthew Lindsay, Esq., St. John; E.B. Chandler, Esq., Petitcodiac; Wm. Patrick, Esq., Belliveau; H. Collins, Esq., St. John; S.R. Foster, Esq., St. John; Duncan Harper, Esq., St. John. In concluding it may not be unimportant to our readers to know that the shaft is now down some 30 feet and what the indications may lead to we know not, but gas escapes now in bottom of shaft to such an extent that it will readily ignite. A short distance below the mine on the side of the brook can be seen the black oil floating on the surface of a pool of water near by, and the freestone rock itself is literally saturated with the oil, thus giving evidence of the near proximity of Albertite or something very like it. The engine is in good working condition and a saw gearing is attached, by which they provide all their own lumber on the spot."

Daily Telegraph - Jul. 17, 1876 Beliveau Albertite and Oil Company. - At the annual meeting of this club, on Tuesday last, at Baltimore, Albert Co., the following directors were chosen: - Hon. A.E. Botsford, Sackville; Matthew Lindsay, Esq., St.

John; E.B. Chandler, Esq., Petitcodiac; Wm. Patrick, Esq., Belliveau; H. Collins, Esq., St. John; S.F. Forster, Esq., St. John; Duncan Harper, Esq., St. John."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Morning Freeman - Jul. 25, 1876 A meeting of the stockholders of the Beliveau Albertite Mine was held on the Company's grounds last week. The work of sinking the main shaft, which it is proposed to carry down 500 feet, is proceeding rapidly, and the indications of the presence of a large deposit of Albertite are said to be very strong. The stockholders were much pleased with what they saw. 1100 of the 1200 shares required before commencing have been taken up, an engine purchased at a cost of $1,850, and other plant, all being worth $4,015. The Post says:- Mr. Patrick was called upon to say something with respect to the prospects of the Company. He stated that in his representations to the shareholders from time to time, he had placed no coal within 500 ft. of the surface, but the more the property was examined, the more hopeful he became for its nearer proximity. The small veins of Albertite, and the gas escaping were to his mind important indications. It was the intention of the Directors to sink 500 ft. and then to cross tunnel. He spoke hopefully of the future prospects of the Company. After some other unimportant business a vote of thanks was presented to Mr. E.B. Chandler, jr., for his gratuitous services; to Mr. Patrick for the manner in which he pressed forward his work, and to the President and the Directors for the energy and discretion they had displayed. The following Directors were elected:- Hon. A.E. Botsford, Matthew Lindsay, E.B. Chandler, Wm. Patrick, Francis Collins, Seth R. Foster, D.C. Harper. The following gentlemen were appointed auditors, Joseph L. Black and David G. Dixon, Esqrs."

Chignecto Post - Oct. 12, 1876 Albertite Discovery.- A small seam has been discovered below the surface at Oil Creek, Beliveau. Possibly it may lead to important results."

Chignecto Post - Sep. 14, 1876 The Beliveau Albertite And Oil Co.- A correspondent asks us for information respecting Diamond boring, which the Co. intend to adopt instead of sinking a shaft. We will endeavor to explain:.- The present operations of this Co., we understand, are to test the correctness of the inferences drawn from the surface indications at Beliveau, that a deposit of Albertite exists there, as at the Albert Mines, or that petroleum may be reached. A shaft 500 feet deep was determined upon, but the expense proving to be greater than estimated, and two years being the time required to sink it, the directors, we learn, concluded to use the diamond borer as the cheaper, quicker and most satisfactory method of proving the truth or falsity of the geological conclusions. The old-fashioned way of boring was by drilling by a chisel, in the same way as quarrymen still drill. The English used iron rods screwed together by which the length of the handle of the drill was adjusted to the depth of the hole. The Chinese used a heavy bar of iron to which the drill was lifted from and let fall to the bottom of the hole, and which was let out as the drill cut the rock. These drills are worked by machinery; in both the principle is the same of cutting away the rock by a succession of sharp blows and reducing it to powder or small particles, and in both there is a difficulty in determining the exact thickness of each different stratum through which the drill passes, and no means is given of arriving at the angle at which the strata lie to the surface. The Diamond borer, however, which is a modern invention, operates very differently. It does not cut the rock by striking a blow, but by revolving and grinding it away. As the name indicates, it is a drill made of diamonds. The diamonds are secured to the end of a hollow cylinder like a gun barrel, which is made to revolve and the diamonds cut away the rock with which they come in contact. The centre of the core of rock remains undisturbed and passes up in the hollow cylinder as the diamonds wear away the rock below them, and from time to time as the drill is drawn up, this core of unbroken rock is brought to the surface and presents as well the exact character of the strata through which the borer passes and their actual thickness as their dip or angle from the surface. By using the Diamond borer in the shaft itself, a perfect section of the strata to the depth cut would be brought to the surface, and if laid on a table would, at a glance, give all the information a shaft could afford. By boring other holes as suggested by the actual knowledge thus obtained, a determination of the facts sought for would be conclusively arrived at. The Messrs. Campbell have been exploring with a Diamond borer in Cumberland, and have bored several holes recently,- one of them being 100 feet in depth. At Beliveau a Diamond borer would average 30 feet a day, and at a cost not exceeding $2 a foot; so that a couple of thousand dollars would give an accurate section of the strata to the depth of double that of the proposed shaft, and by a series of other holes a large area could be fully tested, altogether at an expense not exceeding $10,000. The objection to boring, that pockets containing Albertite might be passed without being noticed, is also applicable to a shaft which might also pass pockets; and in drifting off from it the pockets might not be touched, so that in view of the much greater depth to which the Diamond borer would reach the chance of missing pockets of the Albertite would be as much less as the depth it went was greater than the shaft. We are therefore glad the Directors have determined upon a course which we always thought was the quickest, most economical, and most thorough of testing this interesting and important problem."

Moncton Daily Times - Aug. 13, 1877 and Daily Telegraph - Aug. 16, 1877 Annual Meeting of the Beliveau Albertite and Oil Company. - The adjourned meeting of this Company was held at Beliveau on Tuesday, the 14th inst. The Report of the Directors, with the accounts of the Treasurer duly audited, was laid before the stockholders and unanimously adopted. The Directors of the past year were re-elected, and subsequently Blair Botsford, Esq., was chosen President and E.B. Chandler, Jr., reappointed Secretary-Treasurer. The authority to Mr. William Patrick to make further sales of stock was continued. The stockholders also recognized and acknowledged the energy and perseverance displayed by Mr. Patrick in the affairs of the Company. The meeting was most interesting and harmonious. Recent developments in the Pit, - the presence, at a depth of 145 feet, of Albertite in unlooked for quantities, the large issue of gas, the varying character of the shale and the disturbed condition of the strata lately passed through - tended to inspire the stockholders with increased confidence in the ultimate results of their enterprise. Mr. James Robertson, a stockholder, an intelligent miner of twenty years' experience in the Albert Mines, in reply to a question, stated that he had no hesitation in asserting that all the conditions existing at the Albert Mine were to be found at Beliveau; and that the prospect of a discovery of Albertite there, in quantity, was most flattering. The pit has been sunk to a depth of 150 feet, and is timbered in the most substantial and thorough manner. The finances of the Company are in the most healthy condition. Calls to the extent of 7 1/2 per cent. have been made upon the shares already sold - about 1,600. The balance of 5 per cent. upon the shares disposed of, together with the amount to be realized from the sale of the remaining 900 shares, will provide ample funds to develop the property of the Company."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Chignecto Post - Aug. 16, 1877 Beliveau.- At the annual meeting on Tuesday, the officers were reelected. The stockholders present expressed themselves much pleased with the indications."

Chignecto Post - Dec. 20, 1877 Beliveau.- About 2,200 shares of the Beliveau Albertite Co.'s stock have been sold, leaving only 300 for sale. The shaft has been sunk 238 feet to date."

S.J. Daily News - Dec. 28, 1877 Memramcook Matters. - The Belliveau Albertite Company now have their pit down about 250 feet. It os the intention to tunnel or drive levels east and west in search of the precious stuff. The stock is all sold with exception of some 250 or 300 shares and it is confidentially expected these will not be in the market long, so intending purchasers had better look lively."

S.J. Daily News - Feb. 15, 1877 The Beliveau Mine. - The Beliveau Albertite and Oil Company have resumed operations, the contract for sinking the shaft has been let, and we understand that the work is to be vigorously prosecuted. We hope that success will crown the company's efforts."

Chignecto Post - Mar. 29, 1877 Beliveau.- Mr. Patrick has sunk the shaft a distance of 70 ft., and has reached a bed of slate having veins of pure Albertite running through it."

S.J. Daily News - May 12, 1877 Beliveau Albertite and Oil Works. - The manager states that the operations at the Beliveau Albertite and Oil Company's Works are progressing favorably. Shaft sinking has reached the depth of 85 feet, at which point shale has been struck lined with pure albertite. This is considered to be very encouraging."

Chignecto Post - May 17, 1877 Belliveau.- The President of the Albertite Company informs us that a leader of albertite was struck a few days ago in the shaft, that has already been followed for four feet and still continues, and the indications are similar to those that were successfully followed at the Albert Mines."

Evening Telegraph - May 19, 1877 Memramcook. - Work at Beliveau Albertite mine is progressing well, though by the breaking of some portion of the machinery the work was delayed a day or so. The discovery of a small vein of the Albertite cheers those interested."

Chignecto Post - May 24, 1877 Beliveau.- The Albertite Mine is exhibiting new and very encouraging indications. Gas commenced escaping from the bottom of the shaft last week, and on Saturday it took fire and singed the men."

Chignecto Post - Oct. 25, 1877 Belliveau Albertite Co.-Mr. Patrick has sunk 110(?) feet. The indications are favorable."

Daily Telegraph - Apr. 5, 1878 Beliveau Albertite Co. - A meeting of the Beliveau Albertite Co. directors - Messrs. M. Lindsay, S.R. Foster, Wm. Patrick, F. Collins, E.B. Chandler, jr., D.S. Harper and Blair Botsford - was held last evening at the Royal Hotel. It was announced that the company is free from debt, and that nearly all the stock has been taken. Everything is in the most favorable condition. Work is progressing well at the mine. The main shaft having been driven 250 feet in depth, levels are now being excavated south and west, some 150 or 200 feet having been driven. Small seams and pockets of the precious stuff are frequently met with and all indications seem healthy."

Daily Telegraph - Apr. 9, 1878 ADVERTISEMENT: The Beliveau Albertite and Oil Company – A further call of two and one half per cent on the Capital Stock of this Company was duly made by the Directors at a meeting, held on the fourth day of April instant, payable on or before the tenth day of May next to the Treasurer, or at the Bank of Montreal, in Moncton or St. John, or to William Patrick, Manager. E.B. Chandler, jr., Treasurer. Petitcodiac, 5th April, 1878."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Moncton Daily Times - Jun. 1, 1878 The Albertite recently found on the Beliveau Albertite Company's property was discovered on the farm of Belony Burk, which is about the last French farm on the Memramcook before entering the

English settlement of Rockland. The spot is about a fifth of a mile from the main road to Rockland and adjacent to a gully, on both sides of which a large number of trial holes have been sunk. A considerable number of persons have visited the location and entered the small excavation from which Albertite has been taken, in search of specimens, of which a barrel or two have been removed. (Very satisfactory specimens of the mineral and its enveloping rock may be seen at the Times office). The vein is of uncertain width, ranging from five to thirteen inches. On Thursday evening, when a representative of the Times visited the place, a miner was digging test pits on the property next above, and had found indications at one or two points. The place is only about a mile from the Belliveau mine on the Petitcodiac side of the hill, and traces of Albertite are found at various points between. Old miners who have worked many years in the Albert mine and are now engaged in the Belliveau, say the indications are far more favorable for finding Albertite where they are now sinking than they were in the Albert mine before the mineral was actually reached. It is to be desired that with the hopeful signs which accompany the operations of the Company, these operations may be vigorously urged and that the stockholders will do all in their power to aid the Directors and their officers in pushing the work of development to a successful issue."

Moncton Times - Jun. 22, 1878 Beliveau Albertite and Oil Company. - The annual meeting of this Company is called for Tuesday, 9th July, to be held at Beliveau. See adv't in today's TIMES."

Daily Times - Jun. 22, 1878 Beliveau ad not found..."

Chignecto Post - May 23, 1878 Beliveau.- The Directors come up to-night and spend tomorrow at the mine, returning tomorrow night. Mr. Patrick is driving in on the northern level. The indications are said to be excellent, the escape of gas increasing the further the shaft is penetrated."

Moncton Daily Times - May 27, 1878 Albertite at Belliveau. - The Telegraph has the following:- Memramcook, May 24. - At Beliveau Albertite mines men have come upon a vein of pure Albertite, which at first was from one to five inches thick, and has since increased to eleven inches, and now gives promise of good development. The stockholders are much encouraged. It is said the Albertite has not been found in the shaft which is being sunk but in an outcrop on another part of the property. It was reported on Saturday that in consequence of the discovery the stock book has been closed. We have seen a sample of the find which is Albertite of the purest quality."

Morning Freeman - May 29, 1878 Of the reported find of Albertite at Beliveau, the Moncton Times says: - It is said the Albertite has not been found in the shaft which is being sunk but in outcrop in another part of the property. It was reported on Saturday that in consequence of the discovery the stockbook has been closed. We have sent a sample of the find which is Albertite of the purest quality."

Chignecto Post - Nov. 21, 1878 Beliveau.- The diamond borer is in position at Taylor's Village vein and boring has

Daily Telegraph - Oct. 5, 1878 ADVERTISEMENT: Notice. -- At a meeting of the Directors of the Beliveau Albertite & Oil co., held in St. John on the 24th inst., a Further call of 2 per cent on the subscribed Stock was ordered to be made, payable on or before the 25th of October, at the Bank of Montreal, Moncton, to William Patrick, Manager, or to E.B. Chandler, Dorchester. By Order, E.B. Chandler, jr., Secretary."

Chignecto Post - Sep. 12, 1878 The Beliveau Albertite and Oil Company purchased from the Local Government the Diamond Borer for $500. The original cost was over $3,000. The manager intends to use it as an auxiliary in sinking the pit on the vein at Taylor's Village. The pit is now 45 feet down. Operations are suspended till the borer is placed in the work. At the depth now reached there is but little Albertite, but they are working in the fault or displacement through which the Albertite found at surface was injected, and the proprietors are confident in finding it at a lower level. At the other workings, the south level is 280 feet long, and the north, 260 feet. Some of the shales on the south level are very rich, and are dipping in the opposite direction from what they are at the pit bottom."

S.J. Daily Sun - Sep. 26, 1878 The Beliveau Anthracite and Oil Co. - A number ofthe Directors of this Company was held at the Royal Hotel on Tuesday evening at which Francis Collins, Matthew Lindsay, William Patrick, Blair Botsford, Fred W. Hales and D.S. Harper, Esquires, were present. - the Directors ordered a further call of two and a half per cent. on the subscribed stock, payable on or before Oct. 25. This Company lately purchased the Diamond Borer from the Provincial Government, and intend to use it in sinking the shaft at the new 13 inch vein. They are now down about 45 ft. in this shaft, indications continuing favorable. The manager is still tunnelling at the old shaft, having reached a depth of 250 ft. These tunnels have been driven south about 300 ft., and north about 300 ft., besides others of shorter distances. Although Albertite is passed through at all points, the Company think they are not deep enough and intend to go deeper. In the south lead the workmen have passed through an anticlinal, the shale dipping north and south. The Company are very hopeful of

S.J. Daily Telegraph - Feb. 27, 1879 and S.J. Globe - Mar. 5, 1879 More Albertite. - A private dispatch received in this city, yesterday, conveys the gratifying intelligence that the Belliveau Albertite and Oil Company have struck four feet of

Albertite at their mine at Taylorville, near Memramcook. This Albertite is at a depth of only 180 feet from the surface. The outlook is very promising."

Daily Telegraph - Feb. 11, 1879 ADVERTISEMENT: The Beliveau Albertite and Oil Com'y. -- Notice is hereby given that at a meeting of the Directors of the Beliveau Albertite and Oil Company, held at the Royal Hotel, in the city of Saint John, on the seventh day of February instant, a call - being the fifth call - of two and one half per cent, was made upon the shares of this company; and I give notice that payment of the said call is required to be made within thirty days from the date thereof. Dated at Dorchester, County of Westmorland, this eleventh day of February, A.D. 1879. E.B. Chandler, Jr.,

S.J. Daily Telegraph - Feb. 11, 1879 Belliveau Albertite and Oil Co. - We direct attention to the notice of a call made by the directors of the Belliveau Albertite and Oil Company. A doubt being entertained of the legal sufficiency of the call made on the 24th September, but the directors, at a meeting held on the 7th February, instant, made a fifth call of 2 1/2 per cent. This is not intended to apply to those stockholders who have paid the fifth installment, under the notice of the 24th

Chignecto Post - Feb. 20, 1879 More Albertite.- A private despatch received in this city, yesterday, conveys the gratifying intelligence that the Beliveau Albertite and Oil Company have struck four feet of Albertite at their mine at Taylorville, near Memramcook. This Albertite is at a depth of only 180 feet from the surface. The outlook is very promising.- Telegraph."

S.J. Daily Sun - Jan. 3, 1879 Beliveau Mines, Dec 25, 1878. - Our Diamond Boreris making good progress. At a depth of 185 feet passed through 17 inches Albertite, some Asphaltum and considerably rich Shale a few feet below it. The prospects continue to improve in the pit as well.- Com. to Truro Sun."

S.J. Daily Telegraph - Jan. 4, 1879 Belliveau Mines. - The following has been communicated to the Truro Sun from the Belliveau Mines:- Our Diamond Borer is making good progress. At a depth of 185 feet passed through 17 inches Albertite, some Asphaltum and considerably rich Shale a few feet below it. The prospects continue to improve in the pit as well."

S.J. Daily Telegraph - Jan. 17, 1879 Accident at Belliveau Mine. - Sackville, Jan. 16. - James Hamilton, son of W.J. Hamilton, hotel keeper at Amherst, had his hand badly crushed at the Belliveau Mines this morning. He was in the excavation where the tubes of the diamond borer enter the ground, when a piece of the tubing which was being placed in position at the surface fell on his left hand crushing it terribly. It is feared that amputation will be necessary. He is under the care of Dr. Wilson of Dorchester."

Moncton Daily Times - Jan. 18, 1879 Accident at The Beliveau Mines. - A Sackville despatch to yesterday's Telegraph says:- James Hamilton, son of W.J. Hamilton, hotel keeper in Amherst, had his hand badly crushed at Beliveau Mines this morning. He was in the excavation where the tubes of the diamond borer enter the ground, when a piece of tubing which was being placed in position at the surface fell on his left hand, crushing it terribly. He is under the care of Dr. Wilson, of

Chignecto Post - Jul. 10, 1879 and Moncton Daily Times - Jul. 11, 1879 and Daily News - Jul. 11, 1879 Beliveau. - The annual meeting of the Beliveau Albertite and Oil Company was held at the company's office on Tuesday, the 8th inst., represented by stockholders from St. John, Prince Edward Island, Nova Scotia and various parts of Westmorland. The affairs of the company were found to be in a most satisfactory condition, and work at the mine going on vigorously, with highly encouraging prospects. By an almost unanimous vote the meeting empowered the directors to make a further call of 2 1/2 per cent. whenever they should deem it advisable. The stockholders present were gratified at the sight of a vein of Albertite which has been recently uncovered and exposed to view for a considerable distance. This vein pursues a course at right angles to that near which the new shaft is being sunk and preserves the general course of the vein at the Albert mine. The old Board of Directors was reelected for the ensuing year. Messrs. Wm. Patrick and E.B. Chandler, jr., tendered the company each 50 shares of their paid up stock to be sold for the benefit of the company, for which generous donation they received the hearty thanks of the meeting. - Sackville Post."

Weekly Freeman - Jul. 19, 1879 The Beliveau Albertite and Oil Company held its annual meeting last week. The prospects of the company are regarded as excellent. A vein of true albertite was recently uncovered for a considerable distance, but this is not regarded as sufficiently large to pay for the working, and the boring is continued. The Directors were empowered to make a further call od 2 1/2 per cent whenever they think necessary."

Moncton Daily Times - Jul. 23, 1879 Beliveau Albertite Stock Sale. - An auction sale of unpaid stock of the Beliveau Albertite and Oil Company will take place at or near the Weldon House in this town, tomorrow afternoon, at half past four
Moncton Daily Times - Jul. 25, 1879 Beliveau Stock Sale Postponed. - The sale of Beliveau stock, advertised to take place in Moncton yesterday, has been postponed till the 2nd day of August next."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Chignecto Post - Jul. 31, 1879 and Daily Telegraph - Aug. 1, 1879 Beliveau.- What is Doing - Indications and Prospects.- Our reporter visited the works of the Beliveau Albertite and Oil Company at Dorchester on Monday to ascertain the

progress made towards developing the Albertite. Last year it will be remembered, that a vein about a foot in width at the maximum was accidently uncovered in the conglomerate formation back of Taylor's Village. On this vein a bore hole was sunk, a distance of 160 feet at which depth, 17 inches of Albertite was passed through - so the foreman - Mr. Patrick, Jr., informed your reporter. A second bore hole was then made a few feet to the south and was sunk 335 ft. At a depth of 185 ft., 49 inches of Albertite was found. The Directors becoming satisfied from these indications that they had at last hit upon the article, and that further boring was unnecessary, commenced sinking a pit. Your reporter found this pit had reached a depth of 50 ft. The shift at work was busy blasting the shale, which was very hard and is found dipping perpendicularly, but so contorted as to have no discernible strike. These shales are overlaid by a conglomerate rock disposed horizontally and unconformably to shales. But the manager has not confined his work to sinking the pit; he has also been prospecting and sinking test pits and cross cutting the strata west of the main pit. At a distance of 600 yards from it, a heavy deposit of red marl exists in which a fracture was found. This fracture has been traced already a distance of 300 yards in a straight line S. 80ø E., and your reporter measured in this fracture a vein of Albertite varying in width from one to three inches. The existence of this fracture in the marl for so great a distance in a right line and filled with Albertite, shews that a uniform force was exerted over the whole extent, and that the fluid Albertite filled the interstices instantaneously with the action. The extent of these interstices would alone determine the quantity of Albertite injected. The uncovering of a continuously regular vein for so long a distance, and which may hereafter be found to extend indefinitely either way, is logical evidence that the Company has hit upon the exact locality where the disturbing force was exerted. And if that force, as scientists agree, was nothing more than the gas of heated, inflammable, fluid Albertite which burst up from beneath, filling up the fractures it had made and being afterwards congealed, it becomes reduced almost to a certainty, that this newly discovered fracture follows the central line of disturbance. If the force were exerted at a distance, or laterally the fracture and vein would not resemble a seam, but would be somewhat irregular; hence the conclusion that the Company are now working above the source of the disturbing power. Another favorable indication is that the boring, so the Manager states, exhibits a fault or slide of five feet, thus increasing the prospect of pockets. At any rate a very few weeks will determine whether the present expectations of the Directors will be realized or not. The diamond borer engine is now used for hoisting, pumping, &c, but in a few days the large engine will be ready for work, when operations will be more rapidly carried on. A distance of 200 feet down or some distance below where the Albertite was struck, will, it is expected, be reached on last of September or early in October."

Moncton Daily Times - Jun. 23, 1879 ADVERTISEMENT: The Beliveau Albertite & Oil Company, The Annual Meeting of the Stockholders of the above Company will be held at Beliveau, in the County of Westmorland, on Tuesday, the Eighth day of July next, at 2 o'clock, p.m. By order of the Directors. Chandler, Jr. Dorchester, 14th June, 1879 Secretary."

Moncton Daily Times - Mar. 6, 1879 The Beliveau Albertite Mines. - Mr. William Patrick, general manager of the Beliveau Albertite and Oil Company, writes: No. 2 Diamond Drill Hole is now 180 feet deep. We have discovered four feet of Albertite and are now boring to facilitate in sinking the Pit Shipping from here may reasonably be expected this season."

S.J. Globe - Mar. 8, 1879 Auction Sales. - Five shares of Belliveau Albertite Company mining stock was sold to Mr. C.A. Stockton for $16 for the lot."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;

Moncton Daily Times - Mar. 29, 1879 The Beliveau Albertite and Oil Co. - A meeting of the Board of Directors of this company was held in St. John, on the 25th and 26th insts. After discussing the best mode of turning to account the late discovery of Albertite in borings it was decide to proceed with the sinking of a shaft a depth of two hundred feet. The work has already commenced by boring with the Diamond Drill to facilitate the blasting."

Moncton Daily Times - May 9, 1879 Beliveau Albertite and Oil Company. - A meeting of the Directors of this Company was held at Weldon's Hotel in this town, on Tuesday of this week, at which a resolution was passed confirming various calls heretofore ordered by the said Company, and ordering their collection within a given time. A notice of the resolution will be found in another column."

Daily Telegraph - May 29, 1879 ADVERTISEMENT: To The Stockholders of the Beliveau Albertite and Oil Co'y. -- At a meeting of the Directors of the above Company held at Weldon's Hotel, in the Town of Moncton, on the sixth day of May, instant, the following resolution was passed:- Resolved that the calls made by the Board of Directors on the Shares of the Stockholders, namely, those made on the eighteenth day of May A.D., 1876, of two and one-half per cent; on the Twenty-seventh day of December, A.D., 1876, of two and one-half per cent; on the fourth day of April, A.D., 1878, of two and one-half per cent; and on the seventh day of February, A.D., 1879, of two and one-half per cent, be, and the same are hereby confirmed, and that due publication thereof be made by the Treasurer, requiring payment of said calls. Dated 7th day of May, A.D., 1879. E.B. Chandler, Jr., Secretary. Notice is hereby given that payment of the above calls is required to be made within thirty days from the date of publication hereof. Dated at Dorchester in the County of Westmorland, the seventh day of May, A.D., 1879. E.B. Chandler, Jr., Treasurer."

Weekly Freeman - Nov. 1, 1879 The prospects of the Belliveau Albertite mine seem bright now. The stock could have been purchased very cheaply a few weeks ago, now there is none on the market. We hope that when the shaft is sunk as proposed the anticipations excited by the boring will be more than realized."

Weekly Freeman - Nov. 15, 1879 The Beliveau Albertite and Oil Co. are rushing things along. The new steam Rock Drill works well, and in consequence they are sinking the pits more rapidly."

Moncton Daily Times - Oct. 7, 1879 Memramcook, Oct. 6.- Work is still being prosecuted at the Albertite mines, and there seems to be reason to hope for ultimate success. Not withstanding this, some of the shareholders are beginning to think that declarations of dividends would be preferable to calls for stock."

Moncton Daily Times - Oct. 16, 1879 The Operations at the Beliveau Albertite Mines. - A correspondent at Dorchester writes:- A great interest is taken in the Beliveau Albertite and Oil Company since the report became current that a large quantity of the mineral had been reached by the borer. The operators for some time past have been sinking a large shaft on the farm of Belony Burk, near Taylor's Village, in order to reach a seam four feet in thickness touched by the borer early in the season. Meanwhile a party with the borer has been making tests at various points in the vicinity of the shaft to ascertain the extent of the deposit. Running at right angles to the Beliveau Ridge is a fissure, or properly a fault, in the formation, caused by some ancient convulsion of the earth's surface which was rent asunder and the earth's crust on one side of the fissure forced up past the other side, so that the strata on one side of the fracture are several feet above the corresponding strata on the other side. This crevice, which at the surface varies in width from one to two inches, is filled with Albertite, and the theory is that the convulsion and depression of the earth's surface, which caused the fault, forced the mineral when in a liquid state up through the break to the surface, from some immense subterranean deposit. It is on a branch of this same fault that the main shaft before mentioned is located. It occurred to some one to try the borer at a point on the fault some four hundred yards nearer the ridge than the shaft, - a point where a cleft is made in the ridge by a ravine, and where the contortions of the surface give evidence of a more general upheaval. The stratification here is nearly horizontal, while the fault is perpendicular, so the borer was started about ninety feet from the fault inclined at an angle of 55 deg. in order to intercept it, over one hundred feet below the surface. The result proved most satisfactory. At a depth of ninety feet, - after passing through marl, a vein of Albertite was reached two feet in thickness, and after passing through ten or twelve feet more of marl the borer again brought Albertite to the surface and continued to do so for the next twenty feet. Whether the deposit for that thickness is in a pure state or not, could not be determined owing to the imperfect nature of the borer. At a meeting of the directors, held at the mine this morning it was decided to sink a trial shaft to the deposit at once and ascertain its exact nature. In the meantime the Company's stock has taken a decided rise in the market and stockholders feel correspondingly comfortable."

Chignecto Post - Oct. 16, 1879 Albertite Discovery.- Those who read the article in this paper some weeks ago, describing the remarkable appearance of a seam of Albertite running in a right line several hundred yards west of the pit at Taylor's Village, Dorchester, as indicating the location of an extensive Albertite disturbance, may be prepared for further important developments. Some time ago drilling in the formation immediately south of this seam was commenced at an angle of 55ø. At 75 feet the borer passed through 5 feet of Albertite; at 90 feet, 2 feet more was passed through, and yesterday 18 feet more was passed through. The evidence is accumulating that this is the seat of an extensive deposit of Albertite."

S.J. Daily Telegraph - Oct. 17, 1879 Beliveau. - A despatch from Dorchester states that the Beliveau Albertite Company, in boring at Taylor Village, has struck another vein apparently of great thickness."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
S.J. Daily Sun - Oct. 17, 1879 Beliveau Albertite and Oil Company. - On Friday last, it is said, the diamond borer of this Company's works struck a vein of Albertite two feet thick on a lead further up the hill at Taylorville, than where the management is at present sinking a main shaft; and on Tuesday the borer again went through a deposit of albertite and marl 15 feet in thickness. A small deposit of this had already been found near the surface and is very valuable. The directors had their regular meeting that day at Dorchester and after going over to the grounds where the new operations are going on, and considering the whole matter, decided to sink a trial shaft 100 feet there and proceed to the work at once. The new leads struck by the borer are valuable and it is believed they are extensive."

Chignecto Post - Oct. 23, 1879 and S.J. Daily Telegraph - Oct. 25, 1879 Beliveau.- The Directors have contracted for the sinking of a test pit, 90 feet to cost $450, on the vein where Albertite was crossed by the borer last week. The pit will be completed in a month."

Moncton Daily Times - Sep. 5, 1879 Beliveau. - In accordance with the order of the Directors, the Treasurer of the Beliveau Albertite and Oil Company gives notice of a further call of two and one half per cent. on the stock of said company."

Moncton Daily Times - Sep. 6, 1879 and Daily Telegraph - Sep. 15, 1879 ADVERTISEMENT: Notice of Call. At a meeting of the Directors of the Beliveau Albertite and Oil Company, held at the Royal Hotel, T. John, on the Twenty-second day of August last, the following was passed: The Secretary-Treasurer having intimated that a majority of the Stockholders who have paid up the 12 1/2 per cent. on their stock had given their assent to the making of a further call of Two-and-one-half per cent. by the Board of Directors. Therefore, ordered that a further call of Two-and-one- half per cent. be made on the Subscribed Capital Stock of this Company. Notice is hereby given that payment of such further call of Two-and-one-half per cent. is requested to be made within thirty days from the date of publication hereof. Dated at Dorchester, in the County of Westmorland, the 4th day of September, A.D. 1879. E.B. Chandler, jr., Treasurer of the Beliveau Albertite and

Chignecto Post Sep. 25, 1879 and Moncton Daily Times, Page 3 - Friday, September 26, 1879 The Albertite Company have now sunk 100 feet.They have obtained a Burleigh Rock Drill to hasten their blasting operations. They expect to reach the place where they touched Albertite with boring rods about the 1st of November."

Moncton Daily Times - Apr. 21, 1880 and S.J. Daily Telegraph - Apr. 22, 1880 The Beliveau Albertite and Oil Company. - The President and Secretary-Treasurer of this company recently visited the works at Beliveau to make an examination of the operations being carried on. They learned that on the eighth inst., after the firing of a blast the miners went into the level from pit No. 2 with an ordinary open lamp, as they had been in the habit of doing, when without warning, an explosion of gas occurred, which threw the men back a distance of fifteen or 20 feet. The gas took fire and work had to be stopped. The fire was extinguished the next day and work resumed. There has since been a continuous discharge of gas. A branch vein leading from the one to which the level is now being driven, has been discovered, from which thirteen bushels of albertite have recently been taken."

Chignecto Post - Apr. 22, 1880 Beliveau Developments.- The work of tunnelling at the bottom of the pit No. 2, towards the vein of Albertite, touched by the diamond borer, have been proceeding satisfactorily till a few days ago, when a couple of miners were struck by a sudden jet or outburst of gas and thrown back from the face of the level some twenty feet, though not injured. The presence of gas together with the issue of water has prevented the work being since actively prosecuted. An air fan is being prepared, which, when completed, will ventilate and permit work being resumed. In the mean time the issue of gas continues unabated. A representative of the POST visited the mine on Monday. The pit was then partially submerged. The roar of escaping gas was almost like distant thunder. One of the bore holes was unplugged in the reporter's presence and a light applied to it, when at once a large and brilliant flame shot up, and burned for some time steadily, until the hole was replugged. Arguing from the analogy furnished by experience of mining in the Albert Mine, the presence of gas is an evidence of Albertite - perhaps not amounting to a demonstration, but still a fact establishing the very great probability of the near presence of albertite in quantity. In all cases where there is Albertite, there is likely to be gas, owing to the highly inflammable character of the material, and it is this fact that has led to the discovery of some of the pockets worked in the Albert Mine. Some of the stock holders appear to be sanguine they are in the eve of an important discovery."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Daily Times - Apr. 24, 1880 To The Stockholders of the Beliveau Albertite and Oil Company. - At a meeting of the Directors of the Company, held on the thirteenth inst., the undersigned were requested to visit the works, to make a careful examination of the operations, to report upon the outflow of gas in the level and to publish over our signatures an account of the present state of matters at the Mine. We accordingly visited the Mine on the sixteenth inst. From our enquiries from Mr. William A. Patrick, the foreman, James Lavin and other miners, we learned that on Thursday, the 8th inst., after the firing of a blast, the miners went into the level from Pit No. 2 with an ordinary open lamp as they had been in the habit of

doing - that, without any warning, there was an explosion of the gas, which threw back the men a distance of 15 or 20 feet from the face of the level into the sump of the pit. The gas took fire and work had to be stopped. On the next day, Mr. Patrick, the foreman, and James Lavin went into the level and succeeded, at considerable risk to themselves, in putting out the fire. The miners then resumed work. Upon firing a blast near the roof of the level there ensued a very large discharge of gas accompanied with a small quantity of water. From that time until the present there has been a continuous escape of gas, and it has been found impossible to proceed with the work in the level until means are taken to get rid of the gas, and the mine thoroughly ventilated. At the mouth of the pit a noise like that of steam escaping from a boiler, or the sound of a large and distant waterfall is heard proceeding from the bottom of the pit. That this proceeds from the escape of the gas there can be no doubt. Mr. Botsford, who went down to the bottom of the shaft with Lavin and another miner, found no such floor of water as would in any way account for this noise or roaring. Mr. Botsford, when at the bottom of the shaft, directed Lavin to put the Davy lamp into the mouth of the level. Instantaneously the lamp filled with the gas which ignited and shewed the lamp full of flame. The lamp was then withdrawn from the level, allowed to resume its former condition and again placed in the level with the like result. The lamp also indicated the presence of gas in considerable quantities in the cavities of the walls of the shaft. We also directed our attention to the recent exposure of the surface veins of Albertite. These are about 50 feet distant from the mouth of the Pit, have been very lately made, and show a branch vein leading from the one to which the level is now being driven. From these veins about thirteen bushels of Albertite have been recently taken. Blair Botsford, President. E.B. Chandler, Sec'y-Treas. Dorchester, April 19, 1880."

Chignecto Post - Apr. 29, 1880 The gas escape at the main pit at Beliveau, still continues unabated, accompanied by a constant roar. Two large gas burners from the pit are now in use in the engine room, dispensing with the use of oil lamps for night work."

Moncton Daily Times - Apr. 30, 1880 Gas at Belliveau. - The engine house at Belliveau is now lighted by gas burners supplied from the pit."

Daily Telegraph - Aug. 6, 1880 The escape of gas on the level and shafts of the Beliveau, Albert county, is something marvelous, having increased lately very rapidly. The level is now within ten or twelve feet of the supposed locality of the bore holes, and the growing conviction in the minds of those interested is that albertite is close at hand. Should it prove so, it would be of immense value to that part of the country."

Chignecto Post - Dec. 2, 1880 Beliveau Stock.- Twelve shares belonging to the estate of Norrie Best could not find a purchase at auction at St. John on Monday."

Chignecto Post - Jul. 1, 1880 The violent explosion of gas at the Beliveau mine on Saturday was the foundation of a false report of the discovery of Albertite."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Chignecto Post - Jul. 1, 1880 Annual Meeting of Beliveau Co.- The annual meeting of the Beliveau Albertite and Oil Company took place at the Company's office, on the Beliveau farm, July 13th, at 2 p.m. The meeting was well attended, stockholders from P.E. Island, Nova Scotia, St. John and other places, being well represented. The following shares were sold for non-payment of calls; John Ryan 10 shares, bought by Robert Holman for $50.00; Daniel Cleveland 5 shares, bought by W.T. Gard for $29.00; J.W. Gordon 5 shares, bought by H.A. Whitney for $12.00; Geo. Ludhope 8 shares, bought by W.J. Wilson, Jr., for $60.00; R.P. Whitney 5 shares, bought by J. and G. Harris for $25.00. The secretary explained that H.A. Whitney had through mistake, been sold out without notice, and asked that he be allowed to bid in Gordon's shares for the amount received by the sale of Whitney's stock; it was sold therefore, as above, for $12.50. Minutes of last meeting were then read and approved. Also report of Auditors. Auditors recommended that the company's funds be deposited so that payment could be made by stock as in other companys. Secretary explained that it was impossible, under existing circumstances, while it is so often necessary to realize by the sale of shares of delinquents. Jos. L. Black, Esq., asked for a more detailed financial statement. Secretary went into details, reading from day-books, &c., and summing up, showed that net liability of the company at present time is $1,700.00, subtracting which from $3,000.00 expected to be realized from sales of stock, leaves an anticipated balance of $1,300.00 in the Company's favor. Senator Botsford asked for the total receipts and expenditures and amount paid for salaries and travelling expenses up to date. The Secretary stated the gross amount received to 31st of May last, to be $37,966, and that salaries and travelling expenses amount to $7,000. Mr. Patrick stated that owing to his interest in the stock and his firm faith in the ultimate success of the enterprise, he has been giving his services to the company, for less than half the remuneration he could receive elsewhere. Senator Botsford considered affairs had been mismanaged and that greater results should be shown after an expenditure of $37,000. He asked, why, when a seam was found, a shaft was not sunk directly on it, instead of having to tunnel under to reach it. Mr. Patrick said any practical man would not need an explanation, and referred to the operations in Albert Mines to prove the correctness of his ideas. Considerable time was spent in sharp speeches all around, when criticisms, complimentary and otherwise, were freely indulged in. The meeting next proceeded to elect directors for the ensuing year. It was first moved and seconded that the present directors be continued in office until September, but their being doubts as to the constitutionality of such an adjournment of the election, after having Judge

Botsford's views on the subject, it was decided to proceed at once with the elections. The following gentlemen were accordingly elected directors: Warden Botsford, E.W. Hales, D.S, Harper, Wm. Patrick, E.B. Chandler, Matthew Lindsay, Wm. Esson, Jos. L. Black and John McKenzie, Esqrs., were appointed auditors. The meeting then adjourned sine die. The directors then met and elected Matthew Lindsay, President for the ensuing year, and re-elected E.B. Chandler, Secy.-Treasurer. Warden Botsford stated that he had not time to devote to the duties of President for another year. Adjourned."

S.J. Daily Sun - Jul. 2, 1880 Albertite. - It appears that the announcement of the discovery of a four foot vein of Albertite on the Beliveau property was premature. It is said that the report was due to a miscalculation on the part of the acting manager. To whatever cause these reports, from time to time, are due - and that the Directory are free from blame in the matter will be believed by all who are acquainted with the members of the Board - it is not in the interest of the Company that such erroneous information is given to the public. The parties having the largest interest in the works have faith in the ultimate success of the enterprise, and anything that happens to shake the faith of others is to be regretted."

Moncton Daily Times - Jul. 3, 1880 The report of the finding of a large vein of Albertite at Belliveau made public in the St. John papers was premature."

S.J. Daily Sun - Jul. 5, 1880 The Beliveau Mine - A Letter of Explanation. - To the Editor of The Daily Sun:- In your issue of 2nd. instant, it is stated that the announcement of the discovery on the Belliveau property was premature, and that the report was due to a miscalculation on the part of the acting manager, etc. As these remarks would seemingly intimate that I announced the discovery of a vein of the above thickness, I beg leave to explain through your columns that I have not authorized such a statement, nor did I mention, in information I conveyed to those in authority, that Albertite in any known quantity had been struck. My telegrams were to the Directors of the Company only (who must be informed at once of any developments made) and not to the public. Since this matter has been going the round of the press in various forms, it may be well, for the better information of its readers, for me to explain the circumstances which gave rise to this report. As we had been blasting in the level almost hourly for a week, with gas escaping in as great quantities as for the past two months and no explosions or ignitions had occurred, it was rather surprising, after discharging a blast on Saturday last, to find the level was on fire. Directly dense smoke, rapidly increasing in volume and emitting an odor similar to burning Albertite, issued from the mouth of the shaft, and so continued until drowned by flooding the mine with water. This, to say the least, was perplexing, for the gas escaping here burns without smoke and makes scarcely any smell. The shales we had been working through contain no less petroleum than before mined; so it seemed highly improbable that they had caught fire so quickly. That this substance, which was on fire and creating the smoke, was highly bituminous none could think otherwise. The query was, what could this substance be? The more I reasoned the more difficult it became to resist the conviction that the rock removed by the blast had exposed albertite. Not only myself but old and intelligent miners of much experience in the Hillsboro Albertite mines were forced to the same conclusion. The above, I feel confident, will convince the intelligent that I erred simply in judging of deceptive appearances, and not in calculating the position of the works. Much erroneous information has been given the public, but it certainly does not come from either the directors or management. Whether these reports arise through ignorance or malice, I cannot say, except this, they are highly creditable productions of either. That any report from any source should weaken the confidence of stockholders, I very much regret, for I am deeply interested in this enterprise, both as acting manager and as one of the largest shareholders, and am therefore determined as far as in me lies to make this undertaking a full and complete success. Thanking you for the space so kindly allowed me, I am, sir, Yours Truly, W.A. Patrick Belliveau Mines, 3rd July, 1880"

S.J. Globe - Jul. 15, 1880 At the annual meeting of the Belliveau Albertite and Oil Company on Tuesday the following directors were elected for the ensuing year: Messrs. Blair Botsford, F.W. Hales, Duncan S. Harper, William Patrick, E.B. Chandler, Matthew Lindsay and Wm. Esson. Mr. Matthew Lindsay was elected President; Mr. E.B. Chandler was re- elected

S.J. Daily Sun - Jul. 15, 1880 The Beliveau Mine. - Annual Meeting of the Shareholders. - Dorchester, July 14. - The annual meeting of the Beliveau Albertite and Oil Company took place at the Mines yesterday, in the new offices in course of erection. In the shaft they are supposed to be within 9 feet of a deposit now; a pipe from the hole made by the borer supplies a gas jet incessantly with pure gas. The cost of the repair on account of the late fire is $300. After inspecting the working of the mine, the stockholders assembled and proceeded with the sale of delinquent's stock, as follows: John Ryan, 10 shares, Daniel Cleveland, 5 shares, J.W. Gordon, 5 shares, George Tudhope, 8 shares, R.P. Whitney, 5 shares, which were bought respectively by Robert Holman for $50, W. Tremaine Gard for $29, H.A. Whitney for $12.50, W.J. Weldon, Jr., for $40, and J. & G. Harris for $25. A sharp criticism by Senator Botsford, concerning the management, called forth an animated discussion. The Sec.-Treasurer stated the present liabilities of the Company to be $1,700, but there was stock yet to realize on to the value of $3,000, which, when disposed of, would leave the company with a balance to their credit of $1,300. The following directors were elected for the ensuing year: Blair Botsford, F.W. Hales, Duncan S. Harper, William Patrick, E.B. Chandler, Matthew Lindsay and William Esson. Warden Botsford did not wish to continue as President, and Matthew Lindsay was elected to that position by the directors. E.B. Chandler was re- elected Sec.-Treas. On motion of B.A. McStovart it was resolved that auditor's reports and abstracts of financial and working operations of the Company be printed in pamphlet form for the information of stockholders. The meeting then adjourned sine die."

Weekly Freeman - Jul. 17, 1880 At the annual meeting of the Belliveau Albertite and Oil Company on Tuesday the following directors were elected for the ensuing year: Messrs. Blair Botsford, F.W. Hales, Duncan S. Harper, William Patrick, E.B. Chandler, Matthew Lindsay and Wm. Esson. Mr Matthew Lindsay was elected President; Mr. E.B. Chandler was re- elected Sec.-Treas."

Daily News - Jun. 18, 1880 More Mining Fancy Pictures. - To the Editor of the Daily News. - Sir, - I notice that the Beliveau Albertite mine is again being trotted before the public. For years past this same operation has in one shape or another been performed just about this time, and always with encouraging prospects. So far the stockholders have had plenty of encouraging words from the lips of interested enthusiasts, but they have enjoyed no practical benefit from the long continued operations of the well paid Manager and his men, Now, why is this so? Is it that the material exists in no considerable quantity in the place or places where it was said to lie in unbounded extent? Or, is the projector of this mining scheme a mere theorist, whose forte lies more in the region of fancy than of fact? The mere issue of gas from a fissure in the level twenty-two feet from the pit and 190 feet below ground, the pushing on work actively just before an annual meeting, the probable value of albertite which the operators may never reach in paying quantities, or the poor comfort contained in the statement that the Beliveau Company will do a good thing if they strike a big deposit in the vein in which they are now working may serve to calm some easily satisfied minds, but it will scarcely allay the grumbling and discontent which years of profitless effort have engendered. Before any further calls are sanctioned by any meeting of stockholders, they should have more evidence than has yet been furnished of the probable success of continued efforts. Tinted maps and neatly prepared drawings are one thing, but the determination of the existence of albertite in a paying quantity is quite another. The one is a mere off-shoot of fancy, the other is a hard matter of fact which something more than mere guess work is needful to establish. Albertite. St. John, N.B., June 17, 1880."

Moncton Daily Times - Jun. 25, 1880 ADVERTISEMENT:The Beliveau Albertite and Oil Company. – Notice is hereby given that the Annual Meeting of the Shareholders of the above Company will be held at the office of the Company, in the Parish of Dorchester, in the County of Westmorland, on the 13th Day of July, next At the hour of 2 o'clock, p.m. By order of the Directors, E.B. Chandler, June 19 Secretary."
Moncton Daily Times - Jun. 25, 1880 Taylor's Village. - The Belliveau Albertite and Oil Co. have almost completed new buildings, in the place of those recently burned."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
S.J. Daily Sun - Jun. 28, 1880 About Beliveau Albertite and Oil Co. - To the Editor of the Daily Sun:- I have frequently seen accounts of the progress of the Beliveau Albertite and Oil Co. in the papers, and of the indications that had lately come to light giving the Company renewed hope and energy, and being slightly interested I have often made enquiry as to what was doing, as I sometimes conceived an idea that matters were not pushed forward as rapidly as one might wish in this important enterprise. I found that one prominent excuse offered by the Directors and officials of the Company was that they could not get stockholders to pay their calls promptly. I am, however, induced to ask why such lukewarmness has been displayed by this Board of Directors, who are supposed to be good business men, having the interest of the Company at heart, in holding back the names of the stockholders owing a large interest in the Company, for months, instead of selling them out promptly as the rules of the Company require? I find that on the 10th of May last some 80 stockholders owning some 500 shares and representing $50,000, having been favored for months by having their stock held for them under futile promises to pay; but in reality waiting till some sure development should occur before they risked anything further, were partially advertised for sale. On the day of the sale the shares of certain persons were not sold as required but still further held back as a favor, and the result is that the secretary of the company has had to re-advertise some 65 shares for sale on the 13th of July next, not to speak of some 79 shares additional that should also have been advertised and sold on the 10th of May last. Supposing these people had been poor or in such a position that they could not pay promptly, it might not matter so much, but when you find names on this list such as Hiram Black, Rev. D.D. Currie, J.W. Gordon, Harmon Humphrey, A. & W. Ogden, Edward Milliken, M. Inglis Moffatt, Josiah Wood, W.H.T. Sumner, R.G. Scovil, A.A. Stockton, and others, the supposition becomes an absurdity. Do the directors of this company imagine this is a proper way to handle these matters, or fair treatment of such stockholders as have paid up promptly? No wonder the company presents the appearance of dragging out a lingering existence with its financial matters handled in this manner. The probability is that not less than five per cent. on an average would be due from these 500 shares, representing $50,000, that should have been sold on 10th May last. This would have placed $2,500 in the Treasurer's hands, and would doubtless do quite an amount of work. It appears to me that this style of conducting the business of the Company has gone on quite long enough. The Directors may be very kind, sympathetic, charitable and accommodating, but it is not a necessity in business matters of this kind, and individuals taking stock in this enterprise should toe the mark so to speak, or if not, take the consequences. Such modes of conducting business lay the Directors and officials open to the charge of favoritism or gross carelessness, either of which I would be sorry to impute to them without further proof. It might be pertinent if some of the stockholders of the Company asked for some explanations on these points on the day of the annual meeting, 13th July next. It is said a prominent member of the Directorate, when in the city lately, assumed a highly indignant air, asserting that the work had not been carried on economically, and that a change in the management must be made, etc. If such a thing be true, I wonder it did not also occur to him, considering that the present Board of

Directors for the past two years have allowed matters to go on in this way. If some changes in the Directors would not also be conducive to the health of the Company? Many of the stockholders probably entertain that opinion at present. There is evidently something Rotten in Denmark, and it behoves the stockholders of the Company, as far as practicable, to be present at this annual meeting on the 13th July next, and probe these various matters carefully, and see that what tends to the best interests of the Company be strictly enforced in the future. I may trouble you again before long, and in the meantime, with many thanks for space, I am, sir, yours truly, STOCKHOLDER CITY, June 26, 1880"

S.J. Daily Telegraph - Jun. 28, 1880 Albertite. - What promises to be a valuable find is the discovery of a large vein of albertite near Memramcook, N.B. For some time workmen have been engaged boring, as an experiment, and they are fully satisfied that the article will prove very productive and remunerative when worked."
S.J. Daily Sun - Jun. 28, 1880 Striking Albertite. - A telegram from Dorchester to those in St. John who are interested in the Belliveau Mine, states that a seam of albertite, four feet thick, has been struck. It is understood that the mine has been on fire, in consequence of a dynamite explosion firing the gas, but the water has been allowed to accumulate and fill the level and the fire is extinguished. It is expected that the management will get the water out today. A Dorchester telegram to the Sun says: A great deal of interest has been aroused here by this discovery of Albertite. It is to be hoped that the Company are in a way to be rewarded for their expenditures and patient waiting."

Moncton Daily Times - Jun. 29, 1880 Striking Albertite. - A telegram from Dorchester to those in St. John who are interested in the Beliveau mine, states that a seam of Albertite, four feet thick, has been struck. It is understood that the mine has been on fire, in consequence of a dynamite explosion firing the gas, but the water has been allowed to accumulate and fill the level and the fire is extinguished. It is expected that the management will get the water out today. A Dorchester telegram to the Sun says: A great deal of interest has been aroused here by this discovery of Albertite. It is to be hoped that the Company are in a way to be rewarded for their expenditures and patient waiting. - Sun."

S.J. Daily Sun - May 1, 1880 The gas escape at the main pit at Beliveau still continues unabated, accompanied by a constant roar. Two large gas burners supplied from the pit are now in use in the engine room, dispensing with the use of oil lamps for night work."

S.J. Daily Sun - May 1, 1880 Prospecting for oil at Beliveau. - The U.S.Company that own leases of land in the vicinity of Beliveau, and that were engaged in boring last season, are so much encouraged by the indications that they have determined to recommence this season on a larger scale boring for oil.- Post."

Moncton Daily Times - May 21, 1880 The Beliveau Stock sale at Dorchester on the 15th, realized considerably over the amount of unpaid calls."

Moncton Daily Times - May 22, 1880 The Beliveau Mines. - A letter from Beliveau states that the machinery in the mines was not seriously injured by the recent fire. The Company have commenced to rebuild and work will be re-commenced in about ten days."

Weekly Freeman - May 22, 1880 A fire at Belliveau Mine, Memramcook, on Wednesday, destroyed the engine house, machinery, and Mr. Patrick's store, with most of his stock."

S.J. Globe - Nov. 30, 1880 Mr. White (of Messrs. Stewart & White) offered 12 shares of the Belliveau Albertite Company stock, belonging to the estate of Mr. Norris Best, at auction this morning, but a bid could not be got."

Moncton Daily Times - Oct. 7, 1880 The Beliveau Albertite and Oil Company. - A full statement of the receipts and expenditures of the Beliveau Albertite and Oil Company, from its inception up to the present time, is published by the Directors. The receipts from all sources during the four years and a part of another covered by the statement were $35,003.68, made up as follows:- Received on calls upon stock, $35,466.94 Received, proceeds of sale of 100 shares of paid up stock, donated by Messrs. E.B. Chandler, jr., and William Patrick. 2,500.00 Received on expenses on calls, 34.30 Received, balance on int. account, 2.44 -- Total, as stated, $38,003.68 The expenditures during the same period were: Charges account, $4,316.26 Contract account, 5,353.00 Wages account, 14,999.73 Rent account, 270.00 Fuel account,

Moncton Daily Times - Oct. 13, 1880 ADVERTISEMENT: To The Stockholders of the Beliveau Albertite and Oil Company. Notice is hereby given that a call of Two and one-half per cent, on the unpaid up shares of the said Company, was made by the Directors of the said Company on the 21st day of September instant, payable before the Twenty-Fifth Day of Oct. Next By order of the Board of Directors. Dated at Dorchester, 22nd September, A.D., 1880 E.B. Chandler, Treasurer, B.A. & O. Company. Sept. 24."

Chignecto Post - Oct. 21, 1880 Mr. Patrick has ceased to be manager of Beliveau Albertite Company. Mr. Byers, of the Hillsboro mine, has been appointed Consulting Engineer."

Chignecto Post - Sep. 2, 1880 The working at the Beliveau Albertite is being continued. The gas is coming out in greater volumes than ever it did before, making it impossible for workmen to stay in the pit at all. They have got down to a strata of shale mixed considerably with coal, and expect to reach the real genuine at every foot."

Daily Telegraph - Sep. 15, 1880 Beliveau Albertite Stock. - This morning Messrs. Stewart & White sold 12 share of the Belliveau Albertite Mining Company's stock, belonging to the insolvent estate of Norris Best, for $22. There was $140 paid up on the 12 shares."

Moncton Daily Times - Sep. 24, 1880 Beliveau Albertite and Oil Company. - The Directors of the B.A. and O. Company, at a meeting held in St. John on Tuesday night, authorize a further call of 2 1/2 per cent. on the unpaid shares of the Company. The Directors also dispensed with the services of Mr. William Patrick as manager."

Moncton Daily Times - Aug. 18, 1881 and S.J. Globe - Aug. 19, 1881 Beliveau Albertite and Oil Company. - An adjourned meeting of the stockholders of the Beliveau Albertite and Oil Company was held at the Weldon House yesterday. Among the subjects for consideration was the propriety of undertaking the manufacture of oil from shale, and a good deal of information bearing on the question was submitted by E.B. Chandler, Esq., one of the principal promoters of the project. It was thought best, however, to take no action at present, as further information is needed on some important points. The discussion of this subject and the passing of an order to collect unpaid assessments on stock to enable the Directors to pay off liabilities, was the only business done."

Chignecto Post - Aug. 25, 1881 Beliveau Albertite and Oil Company.- Directorsmet at Moncton on Wednesday, 17th inst. to discuss the propriety of undertaking the manufacture of oil from shale, and a good deal of information bearing on the question was submitted by E.B. Chandler, Esq. Further information was needed and the passing of an order to collect unpaid assessments on stock to enable the Directors to pay off liabilities, was the only business done."

S.J. Globe - Jul. 13, 1881 The annual meeting of the Belliveau Albertite and Oil Company was held yesterday and the following Board of Directors elected: E.B. Chandler, D.S. Harper, F.W. Hales, J.B. Noonan, Blair Botsford, A.E. Killam, and M. Lindsay. Another meeting will be held next week to receive the report from Scotland on the probable cost of manufacturing oil from shales."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Chignecto Post - Jul. 14, 1881 The Beliveau Albertite and Oil Company met on Tuesday. The following were elected directors: E.B. Chandler, Dorchester D.S. Harper, Shediac F.W. Hales, Charlottetown I.R. Noonan, Pictou, N.S. Blair Botsford, Dorchester A.E. Killam, Moncton M. Lindsay, St. John"

S.J. Daily Sun - Jul. 14, 1881 At the annual meeting of the Belliveau Albertite and Oil Co., on Tuesday, Messrs. E.B. Chandler, Blair Botsford, A.E. Killam, M. Lindsay, D.S. Harper, F.W. Hales and J.B. Noonan were chosen directors."

Weekly Freeman - Jul. 16, 1881 Messrs. E.B. Chandler, Blair Botsford, A.E. Killam, D.S. Harper, M. Lindsay, F.W. Hales and J.R. Noonan were chosen directors of the Belliveau Albertite and Oil Co., which held its annual meeting on Tuesday."

S.J. Daily Sun - Jun. 28, 1881 The annual meeting of the stockholders of the Beliveau Albertite and Oil Co., will be held at Beliveau, at the old works of the Company, on Tuesday, the 12th July, at 10 a.m. A general attendance of the shareholders, either in person or by proxy, is particularly requested, as a proposition will be made at the meeting, that the company shall engage in the manufacture of oil from shale. Other important subjects will also come up for discussion."

Moncton Daily Times - Aug. 10, 1882 Beliveau Stock. - The sale of Beliveau Albertite and Oil Company Stock, advertised to take place on the 8th, has been further postponed till the 22nd instant. The postponement was made on account of the directors having received word from some parties at a distance that they would like to make arrangements in regard to stock subscribed for by them. The Directors still anticipate a favorable result to present operations."

Moncton Daily Times - Jan. 25, 1882 Beliveau. - Application will be made at the next session of the Legislature for power to accept, surrender or release of stock from the shareholders in the Beliveau Albertite and Oil Company, and to re-issue the shares so surrendered."

Moncton Daily Times - Jul. 5, 1882 Beliveau. - The Secretary of the Beliveau Albertite and Oil Company in a circular to shareholders, dated 3rd. inst, says: The Directors of the Beliveau Albertite and Oil Company have the pleasure of announcing to the stockholders that a vein of Albertite has been struck on the property of the Company. The vein, at a depth of thirty feet from the surface of the rocky shale, was pierced by means of a hand-borer driven from the bottom of the Chandler Pit, and at that point is not less than a foot in thickness. Another bore hole is now being put down on the continuation of this vein, at a point distant, in a southwesterly direction, about four hundred yards from the first bore-hole.

Work has been resumed at the old pit, under the charge of Mr. James Robertson, late of the Albert Mines. As soon as the shaft and tunnels are emptied of water tunnelling will be proceeded with in a direction which, it is expected, will develop a large pocket of Albertite - a continuation and enlargement of the vein pierced by the borer."

Daily Telegraph - Jul. 6, 1882 The Beliveau Albertite Company's circular claims that a vein of Albertite has been struck, of a foot in thickness and at a depth of 30 feet. A confirmation of this news would be heard with pleasure."

Daily Telegraph - Jun. 29, 1882 and Moncton Daily Times - Jul. 5, 1882 NOTICE – Notice is hereby given that the Annual Meeting of the stockholders of The Beliveau Albertite and Oil Comp'y, will be held at Beliveau, at the Oil Works of the Company, on Tuesday, the eleventh day of July next, at the hour of ten o'clock, a.m. By order of the directors. E.B. Chandler St. John, 11th June, 1882 Secretary."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Daily Telegraph - Aug. 1, 1883 Belliveau Albertite Mines. - Prospecting Begun - A Sketch of the Works. - In view of the beginning of boring operations at the Belliveau Albertite Mines, a short sketch of the history of the project may be interesting. The company owning the mines was organized in 1875 with a capital of $500,000. It owns about 4 « square miles of land in Westmorland County, extending from the Petitcodiac to the Dorchester River. A shaft 52 feet deep was sunk in 1877 and extended to 267 feet in 1879, and two tunnels afterwards were run, one being 326 feet and the other 330 feet long. Small deposits of Albertite were found and much inflammable gas. In May, 1879, a discovery of Albertite, near the surface, in one of the veins at Taylor Village, induced the manager to prosecute its further development. Shales were struck at a depth of 40 feet from the surface - the vein passing into them. With the view of testing this and the other veins in this locality, a diamond borer was purchased from the Government and put into operation in the month of November. At the depth of 100 feet the borer, at an easterly angle, passed through 17 inches of Albertite, and was continued down through the shale a depth of 335 feet without again striking the vein. A second bore hole was started a few feet southwesterly from the first. At a perpendicular depth of 170 feet the drill passed through 49 inches of albertite, the vein being apparently a continuation of that struck at a depth of 100 feet in the first bore hole - the horizontal distance between the two points being about 15 feet. The second hole again passed through 14 inches of albertite at a depth of 210 feet from the surface, or 50 feet below the 49 inches of albertite, and again, at a depth of 302 feet, passed through 2 inches, and was continued to a total depth of 325 feet. In view of these interesting developments, and from the fact that the vein extends horizontally along or near the surface, a distance of 400 or 500 yards, the manager was instructed to sink a pit near the vein to a depth of 200 feet. A shaft was then commenced about 20 feet westerly from the 170 feet hole, and sunk to the depth of 165 feet, when a tunnel was projected easterly to strike, as it was supposed, the vein of 49 inches; this they did not do, but about the distance from the mouth of the tunnel and where this vein, it was supposed, would be, gas made its appearance in such quantities as to make artificial ventilation necessary to render the tunnel fit to work in; this issue of gas was so great that the work was delayed for several weeks, and on three several occasions took fire, and the tunnel had to be flooded to extinguish it. It is now asserted that a mistake was made in the measurement of this shaft, and that it was not as deep down by about twenty feet, as the forty nine inch vein, which they were in search of. The escape of gas from the mouth of the borehole, when lighted, burned so brilliantly that it was plainly visible at night for a long distance in the surrounding country, and was found to be so great that, by inserting a pipe security at the surface, it was brought into the engine house, not far from the shaft, and utilized, burning night and day, and giving them ample light at all times for five or six months, until their work ceased at that place, and has been ever since escaping through this shaft, now filled with water, as also through the bore- hole until filled up by some mischievous person, as it now is. Mr. George Botsford, of Fredericton, holds the exclusive right of prospecting over the lands of this company, and it is by him that the diamond borer has been brought out the mines. The engineer of the Drill company has discovered a flow of oil near the place where the boring is to be made. A company of United States capitalists is boring for oil in the neighborhood and has already found some of excellent quality, though not in very large quantities. The boring operations in the Belliveau mines are conducted in the hope of finding Albertite, and if they prove successful the stock of the company, which has been of little or no value, will be at a premium. It is said that the Albert mine yielded a dividend in

Weekly Transcript - Aug. 15, 1883 Boring for Minerals. - Mr. D. Craig, Mining and Mechanical Engineer, was in Moncton yesterday, and in conversation with a Transcript representative some interesting facts relative to the use of the Diamond Borer in prospecting for minerals and developing underground treasures were gleaned. Mr. Craig is now commencing operations to bore for Albertite on Mr. Alfred Taylor's farm at Taylor Village, where the Belliveau Albertite Company have a mining lease. Mr. George Botsford, of Fredericton, is the lessee of the Company, has engaged the borer, which is the property of the Pictou Diamond Drill Boring and Prospecting Company. Mr. Craig has been for some weeks past engaged in getting ready for operations and has now commenced the work of boring. The Diamond Borer has proved the most rapid and satisfactory appliance for prospecting under ground. The bit or cutting part of the borer is a hollow tube, the lower end or cutting edge of which is set with diamonds. This with the rods, (which are lengthened from time to time as required) connecting with the machinery above, is rapidly revolved and cuts its way into solid rock rapidly. The operation of the borer leaves a central core of rock, and this is brought to the surface from time to time, and shows the character of the different rock strata as they are penetrated by steam power. The diamond borer was purchased some nine years ago by the Company above named, and has since been employed extensively for various purposes in Pictou, Cape Breton, Cumberland, Halifax and St. John counties. In the latter county, at Ten Mile Creek, some years ago aboring was made for Messrs. Betts, Vaughan & Co. to the depth of 300 feet. The object was coal, which was not found. In Pictou County numerous borings were made in the interest of various parties holding mining leases. The result demonstrated that the coal fields of that section were less extensive than had been before believed to be the case. Among other borings made were three in the vicinity of the Foord pit, for the Acadia Coal Company. In one of these a depth of 1340 feet was reached, and in other instances 1030 and 600 feet respectively. At Joggins a number of borings were made, the deepest of which were 1,100 and 1,000 feet respectively. In one of these, again the boring at Ten Mile Creek, a supply of water was struck, which made a flowing well. The borer has frequently been used in making artesian wells. In this way it was utilized by the Halifax Sugar Refinery to procure a supply of water for it. At Spring Hill five artesian wells were bored for the Spring Hill Mining Company, three of which were successful flowing wells. The depth of these was from 400 to 750 feet respectively. One of these wells has, since its completion, discharged water at the rate of 20 gallons per minute. The diamond borer now in use at Taylor Village is"

Chignecto Post - Aug. 23, 1883 and Moncton Daily Times - Aug. 24, 1883 Beliveau Again. - The Diamond Drill Prospecting Co., of Pictou, N.S., commenced boring at Beliveau for Albertite and oil on Friday, 10th, at the place where escaping gas has been noticed. The Company purposes to bore 900 ft., if necessary. The new departure has been made at the instance of Mr. Geo. Botsford, who holds the right of the company for a year. - Post."

Daily Telegraph - Jan. 31, 1883 The Beliveau Albertite and Oil Company. - This company's brief report shows that Albertite has been found in small quantities in the shaft which is being sunk; also that considerable quantities of oil have been met with. Mr. McOuat and other mining engineers speak encouragingly of the prospect of finding both Albertite and oil at greater depths. Mr. George Botsford, of Fredericton, signs the report, and is prepared to correspond with parties interested in the

Daily Telegraph - Jul. 10, 1883 Beliveau Albertite and Oil Company. - There is a fair prospect, it is said, that after the meeting of the stockholders of this company, which takes place to day at Beliveau, in Westmorland, final arrangements will be made for immediate testing whatever deposit may be there with a diamond drill or borer, under the management of a skilful and experienced engineer."

Daily Telegraph - Jul. 24, 1883 and Moncton Daily Times - Jul. 25, 1883 and Weekly Transcript - Aug. 1, 1883 Beliveau Albertite and Oil Company. - The Pictou Diamond Drill Company have their machinery now on the property of this company, at Dorchester, and will proceed at once to bore for albertite and oil. Stockholders begin already to look upon their certificates as of more value than before, and the stock will probably rise in the market at the improving prospects. -

Chignecto Post - Jul. 26, 1883 and S.J. Daily News - Jul. 27, 1883 Dorchester.- There were not sufficient number ofstockholders present at the meeting of the Beliveau Company, called the other day to organize. An arrangement has been made with the Pictou Diamond Drill Company to bore for Albertite, and some of the machinery is now on the ground."

Moncton Daily Times - Jun. 27, 1883 and S.J. Daily News - Jun. 28, 1883 Beliveau Albertite and Oil Company. - The Annual Meeting of the Stockholders of the Beliveau Albertite and Oil Company in which St. John are interested will be held at Beliveau, at the old works of the Company, on Tuesday, the 10th day of July next, at two o'clock, p.m."

Daily Telegraph - Jun. 28, 1883 and Moncton Daily Times - Jun. 29, 1883 The Beliveau Mining Co. - The Telegraph says it is understood that a proposition will be made to stockholders of this company at their meeting on the 9th prox. by which an offer will be made to fully develop the mines at no expense to the company, unless the development is successful. This offer was made to the directors and declined."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Daily Telegraph - Nov. 17, 1883 Beliveau Company Outlook. - The diamond drill at the depth of 650 feet passed into oil shale, and soon oil in considerable quantities came up with the water used in working the drill, and has continued to flow to a more or less extent to the present time. Since striking the oil the drill has passed through 100 feet of this oil shale, and now at the depth of 750 feet, where they are operating, this shale has become very soft, and a larger flow of oil came up than at any one time before. Some of this oil shale is so thoroughly impregnated with oil that, after being brought up and exposed to atmospheric action, quite large globules of pure oil came out on its surface. This shale, when placed in a hot fire, burns with the same clear, bright flame, without any smoke, as Albertite, but leaves a much larger residuum. The oil is pronounced by those who have had experience in such things as being as much superior to the common oil, found in other regions, as Albertite, its undoubted neighbor, is to common coal. Here these both tangible and ocular evidences prove the existence of a deposit which, if properly manipulated by the company, must produce a large and profitable return.

Daily Telegraph - Nov. 19, 1883 Beliveau Albertite and Oil Company. - Taylor Village, Dorchester, Nov. 17. - To the editor of the Telegraph. - Sir, - Please give a place in your paper to the enclosed extract, for the information of the stockholders in the Beliveau Albertite and Oil Company, as well as of the general public. I have forwarded a copy to the president and secretary of the company, requesting that a meeting of the directors should be called as soon as possible, while the drill is on the spot and the engineer is present to give them all the information they may require of him, with the view of considering the propriety of taking immediate steps to utilize this development of oil, which, in any oil region would be promptly seized upon, and an oil well opened of the usual size to insert an oil pump. The existence of oil here, in great quantities, can no longer be matter of doubt, and the stockholders would be blind to their own interest if they allow it to remain without taking steps to obtain what to them must be of great value. The diameter of the drill which is now being used is only 2 inches which, of course, must have passed through a large amount of oil measures to bring up the quantity of oil it has. The drill has now, without the use of water, cleared out the filling in of the hole with the exception of one foot at the extreme depth, and I hope today will be down again on the shale at work. The material brought up is pulverized and broken pieces of shale, smelling very strongly of petroleum and mixed up with gobs of pure oil. The oil is said by those who have experience in such things, to be the best yet discovered, and the sand which occasionally comes up to be undoubted oil sand, and such as occurs in other oil districts. Under these circumstances, I think I may urge upon the stockholders to be up and moving. I may here state that the water used for boring passes down the hollow rods and is forced up to the surface again between the outside of the rods and the hole; which hole is about 1-16th of an inch larger than the rods themselves, and brings up what the drill pulverizes. Yours, etc., George Botsford. Extract from the daily record of the engineers of the Diamond Drill Co., now boring on the property of the Belliveau Company, at Taylor Village, Dorchester, giving date, depth bored, character of material and other facts: Sept. 18 - 297 feet, 8 feet hard and 6 soft shale. A small quantity of oil shown on the water after standing sometime. Sept. 24 - 358 feet, 12 feet hard shale. Oil on the water. Oct. 1 - 427 feet, 10 feet hard shale. Oil on the water in small quantity. Oct. 6 - 477 feet, 5 feet shale. Oil increasing. Oct. 9 - 539 feet, 14 feet shale. Large quantity of sand containing small pieces of albertite. Oct. 19 - 607 feet, 15 feet hard shale. Sand which experts call oil sand. Oct. 22 - 666 feet, 9 feet shale. Oil flowing strong, commenced to flow strong at 657 feet. Oct. 23 - 671 feet, 11 feet shale. Oil flowing in large lumps all day. Oct. 24 - 688 feet, 17 feet shale. Oil still flowing and sand. Oct. 25 - 696 feet, 8 feet shale, soft. Oil still flowing and sand. Oct. 26 - 717 feet, 13 feet shale, soft. Oil flowing not so strong. Oct. 27 - 718 feet, 1 foot shale, soft. Oil flowing; nut of screw gave out today. Nov. 1 - 725\6 feet, 8 feet shale, soft. Oil flowing. Nov. 2 - 736 feet, 10 feet shale, soft. Oil flowing. Nov. 3 - 746 feet, 10 feet shale, soft and hard. Oil flowing. Nov. 6 - 752 feet, 10 feet shale, soft. Oil flowing; hole filling in. Nov. 12 - 757 feet, 5 feet shale, very soft. No oil flowing today, but on clearing out hole considerable oil. Nov. 14 - Clearing out hole today. Hole filling in, more oil

Daily Times - Oct. 16, 1883 and Weekly Transcript - Oct. 17, 1883 The Diamond Drill Boring and Prospecting Co.,have now reached a depth of over 500 feet in the bore hole at Taylor Village, near Dorchester, where they are engaged under contract to New Brunswick parties, prospecting for Albertite. Already between $40,000 and $50,000 have been expended in looking for this substance. The correct mode for prospecting is now being resorted to, to find the looked for mineral. -

Daily Telegraph - Oct. 23, 1883 Beliveau Albertite and Oil Company. - To the Editor of the Daily Telegraph: Sir:- As it may be of some interest to the stockholders of this company to know something of the progress of the diamond drill on their property, with your permission I will say that on Saturday last they passed their 600th feet in depth, having at intervals during the day brought up small pieces of purely developed albertite with that portion of the shale which the drill grinds from off the main body and which is brought to the surface by a constant flow of water passing down the inside of the hollow pipes and coming to the surface between the iron pipes and the hole bored, the diamond being so arranged as to make the diameter of the hole somewhat larger than the iron rods (through which the core comes) themselves. Some of the shale taken up in the core that day was the richest yet found, and dotted with particles of pure albertite. This shale is very redolent of petroleum, and when placed on a hot fire burns with the same clear bright flame as does albertite, leaving a black soft residuum which, when crushed, forms an impalpable powder and proved to be excellent for cleaning brass, etc., During the operations of that day oil flowed too more freely than it had done before, although during the progress of the work it has occasionally come up with the water, but not in so great a quantity. The shale met with in going down has been varied, sometimes hard and again soft, with this peculiarity that some of it when burned leaves the main body undiminished in size and much harder than before burning; some of the dark brown shale is exceedingly strong of petroleum and when broken there are plain traces of oil through it, and some with decided deposits of albertite completely imbedded in the shale itself without any connexion with each other, the shale itself being firm and solid. From all the surroundings and appearances it looks very like better results to the stockholders than have yet been accomplished. October 22, 1883 B."

Codes: L3 / IDX_Names: Beliveau Albertite and Oil / Gas;
Daily Telegraph - Sep. 19, 1883 Beliveau Mines. - Boring is progressing at the Beliveau mines, with good prospects of success. At 266 feet depth, a deposit of a light colored shale was met. It burns as brightly as Albertite and leaves a soft black residue, looking like black lead. Ore also collects in the hole when the borer is not working. The prospectors feel very

S.J. Daily Sun - Jul. 12, 1884 The Beliveau Albertite and Oil Company held its annual meeting on the 8th inst. The following were elected directors:- Blair Botsford, E.B. Chandler, F.W. Hale, A.E. Killam, R.R. Barnes, D.S. Harper and A.H. Chandler. The meeting subsequently adjourned to Tuesday, the 19th day of August next."

Weekly Transcript - Jul. 21, 1886 Meeting of the Beliveau Albertite and Oil Co. - After an inspection of the recent operations and developments at Taylor's Village, a number of the stockholders met at the office of the secretary in Dorchester. Peter Ross, Esq., attended as the representative of the Halifax stockholders and F.W. Hales, Esq., as that of the Charlottetown shareholders. Mr. E.B. Chandler holding the proxies of most of the St. John stockholders. It was ordered that the treasurer should forthwith proceed to advertise and sell the shares of delinquent stockholders at public auction at Moncton. The treasurer was also authorized to dispose of at private sale the 30 shares of stock now held by the company. The following letter from Mr. James Robertson, late of the Albert mines, was read: Albert Mines, July 12, 1886 E.B. Chandler, Dear Sir. - I hope you will be able to get the company to raise sufficient money to prove that part of their property, where we have been working, as it is my opinion that there is a large body of Albertite in that locality, and I would like to see it tested. Hoping you may be able to get the company to put up the money, I remain yours, James Robertson. The secretary was instructed to put down a shaft through the limestone which immediately overlies the shales, as soon as the state of the funds permits, such shaft to be sunk at or near the point where the leaders of Albertite cut in the tunnel present the best showing. Samples of the Albertite in marl taken from the tunnel can be seen at Enman's drug store, Moncton. The marl has a thickness of about 15 feet and is underlaid by limestone, the veins of Albertite continuing down and into the limestone. E.B. Chandler, Sec'y. Dorcnester, 13th July, 1886"

Moncton Daily Transcript - Jan. 25, 1890 Death of E.B. Chandler. - Mr. E.B. Chandler, of Dorchester, son of the late Lieutenant Governor Chandler, died at the Mansard House, Petitcodiac, this morning. He was taken ill at Petitcodiac a few days ago with la grippe, which developed into pneumonia, with fatal results. His wife, his brother, Dr. A.H. Chandler, and his son W.B. Chandler, of the legal firm of Emmerson and Chandler, were with him at the time of his death. The remains passed through Moncton by the noon express to-day for Dorchester, where the funeral takes place at two o'clock on Monday afternoon. The deceased was a lawyer by profession, but for the past few years devoted his time to mining enterprises, the Beliveau Albertite and Oil Company and others. He was a prominent figure in church matters and his death will be sincerely regretted by a large circle of friends in this section."

Moncton Daily Times - Oct. 27, 1882 A Promising Outlook. - Boring at the Belliveau Albertite Mine have reached a depth of 680 feet. As the operations have proceeded oil has been met with at times and during the last day or two the shale brought up was impregnated with oil and burned freely. On Wednesday the flow of oil began to be continuous and it had continued so when our correspondent last wrote. The oil is remarkably pure. There is no doubt that a deposit of oil has been struck, the only question to be decided being as to the quantity. If it proves to be large look out for a boom in Belliveau mining

Codes: L3 / J8 / IDX_Names: Beliveau Albertite and Oil / Gas; Albert Mines;
S.J. Daily Sun - Jun. 17, 1880 Beliveau Mines. - Stockholders in the Beliveau Albertite Mines, in this city, have received very favorable accounts of the indications of striking albertite at an early date. Pure gas is now issuing from a fissure in the level 25 feet from the pit and 190 feet below ground; and the gas utilized for lighting the shop before the late fire was taken from a bore hole 250 feet deep. No connexion has been made between that bore hole and the face of the level. As the fissure from which the gas issues is a small one, in solid shale, the managers are confident that they are nearing the albertite. They are now pushing on work actively, having resumed operations about 15 days after their works burned to the ground. As albertite is now worth $25 per ton, and none to be had at any figure, all the output of the Albert Mines having been bought up by American firms, the Beliveau Company will do a good thing if they strike a big deposit in the vein on which they are now working and from which they took 12 bushels on the surface."
S.J. Daily Sun - May 1, 1890 Bank Stock Sale... stocks belonging to theestate of the late E.B. Chandler were sold yesterday ... 322 shares Western and Albert mining and manufacturing stock were knocked down at $5 for the lot; 10 shares Belliveau Albertite & Oil Co. could find no bidder..."

It owns Leases of large Tracts of Land, covering valuable Deposits of Bituminous Shale or Schist, suitable for the manufacture of Paraffine Oil, of the finest quality. -- 500 Shares in the above Company are unavoidably offered for sale, at a low figure. Apply to Stephen Binney, Moncton, or Thomas McHenry, July 4-1m Broker."

Sackville Borderer - Aug. 11, 1865 OIL MINES. - Extensive preparations are now being made in Rockland, about four miles from Dorchester for the manufacture of oil, from oil stone. Large buildings are in course of erection for the Company. The second cargo of oil stone has just been shipped from here for the United States. - Com."

S.J. Daily Globe - Aug. 14, 1865 We learn from the Borderer that extensive preparations are now being made at Rockland, a place about four miles from Dorchester, for the manufacture of oil from the oil stone with which the district is said to abound. Large buildings are in course of erection for the Company. Cargoes of the stone are being shipped to the United States. Who will doubt the possibility of taking blood from a turnip after that?"

S.J. Daily Globe - Sep. 30, 1865 (from Eastern Advocate - Albert Items) - But another source of wealth which must ere long become a matter of importance to the immediate town of Dorchester is her oil-bearing shale, which Westmorland appears to contain in quantities scarcely less than Albert. About three miles from the village, on the opposite side of the Dorchester River, a Company are now raising this valuable shale and exporting it to the United States. The quality of this useful material is said to be most superior - eighty-five gallons of oil being obtainable from a ton of shale by the improved process of extraction, and the quantity is supposed to be inexhaustible. We hope the day is not far distant when the cannelite beds of Albert and Westmorland will yield a golden harvest to the Companies that work them, and to the people generally. But in order to derive the utmost benefit from this valuable shale it will be necessary for the Company at Dorchester, as is contemplated by the Company in Albert, to surmount these obstacles that prevent the manufacture of the oil on the premises, and thus save the profits now received by the Americans."

Morning Journal - Nov. 6, 1868 ADVERTISEMENT: Westmorland & Albert Mining and Manufacturing Company, A special meeting of the directors of the above company will be held at the Office of the Secretary in Moncton, in the county of Westmorland, on Tuesday, the third day of November next, at the hour of one o'clock, p.m., for the purpose of taking into consideration the propriety of selling and disposing of the loose and personal property in and about the Works of the Company at Memramcook, with a view to the liquidation of various claims against the Company. Dated the 6th day of October, 1868. Ed. B. Chandler, E.B. Chandler, jr.} President. Secretary.}"

Daily Times - Dec. 31, 1888 Equity Court. - Mr. C.A. Palmer and Mr. W.B. Chandler supported an application for an order to compel Austin S. Howarth, of Salem, Mass., administrator of the estate of the late John Howarth, to give further security than the $500 administration bond already gives in the estate. The application is made at the instance of Oliver Jones, who claims to be a creditor of the late John Howarth to the amount of $1400, and is made on account of the administrator advertising for sale the bulk of deceased's property - some 5,200 shares in the Westmorland and Albert Mining Company. His honor made an order compelling the administrator to give an additional bond of $1500 with sureties.

The costs of the suit were reserved. Mr. Hanington appeared for the estate."

Moncton Daily Transcript - Jun. 4, 1888 and Daily Times - Jun. 5, 1888 MINING MATTERS.- The annual meeting of the Westmorland and Albert Mining Co. was held at the Brunswick House today. The Board of Directors elected was: E. Sacomb, F.A. Bovey, of Salem, Mass.; E.B. Chandler, W.B. Chandler, A.W. Chapman and H.R. Emmerson, of Dorchester, and J.F. Newcomb, of Boston. Mr. H.R. Emmerson was afterwards elected President of the company and Mr. E.B. Chandler Secretary. The property of the company is situate at Rockland and consists of oil and shale works. It is understood that negotiations are pending which will probably lead to the active working of the property by American capitalists. The company has been reorganized with this end in view and to complete the negotiations."

Codes: L4 / IDX_Names: Westmorland County Oil Shales;
Daily Telegraph - Jun. 5, 1888 Moncton. - Westmorland and Albert Mining Company. - Moncton, June 4. - The annual meeting of the Westmorland and Albert Mining Company was held at the Brunswick House, today. The following directors were elected: E. Sacomb and F.A. Bovey, Salem; E.B. Chandler, W.B. Chandler, A.W. Chapman and H.R. Emmerson, Dorchester; J.F. Newcombe, Boston. Mr. Emmerson was afterwards elected president of the company, and Mr. E.B. Chandler secretary. The property of the company is situated at Rockland, Westmorland Co., and consists of oil and shale works. Negotiations are pending which will probably lead to the active working of the property by American capitalists."

Chignecto Post - Jun. 7, 1888 Westmorland and Albert Mining Co.- A meeting of the Westmorland and Albert Mining Company, which was organized about twenty years ago, was held at Moncton Monday and the following directors were elected: Eben Seccomb, Boston; F.A. Bovey, George L. Newcomb, Salem, Mass; E.B. Chandler, W.B. Chandler, A.W. Chapman and H.R. Emmerson, Dorchester. The property of the company situate at Rockland, near Dorchester, consists of oil and shale works. The latter is said to be susceptible to a beautiful polish and an excellent substitute for marble for building purposes. There are millions of tons in the deposit and if expectations are realized, will be of immense value. Negotiations are in progress which it is believed will lead to immediate working."

Fredericton Daily Gleaner - Dec. 2, 1889 A Boston company is about to re-open the old shale works of the Westmorland and Albert mining and manufacturing company, at Rockland Bridge."

Moncton Daily Transcript - Dec. 10, 1889 Dorchester.- Work is progressing at the Shale Works near Rockland station. Those Boston capitalists mean business."

S.J. Daily Sun - Dec. 17, 1889 Work is progressing rapidly at the Shale mine at Rockland, in Dorchester parish. Men are at work steadily, and the company evidently intend to work the mine to its fullest extent."

Moncton Daily Times - Mar. 6, 1889 Sale of Mining Shares. - Our Dorchester correspondent writes, under date March 5: This forenoon, 5358 shares of the Westmorland and Albert Mining and Manufacturing Co., belonging to the estate of the late John Howarth were offered for sale. They were bid in by D.L. Hanington for $500."

Chignecto Post - Mar. 7, 1889 Dorchester.- Several thousand shares of the Westmorland and Albert Mining and Manufacturing Co. were sold by auction on Tuesday morning."

S.J. Daily Sun - Nov. 27, 1889 The Westmorland and Albert Mining Co., of which H.R. Emmerson is president and E.B. Chandler, secretary, have concluded arrangements with a Boston syndicate whereby the shale works at Rockland Station will be opened on a large scale. - Transcript."

Chignecto Post Nov. 28, 1889 The Westmorland and Albert Mining Co. have concluded arrangements with a Boston syndicate for the operating of the shale works at Rockland. It should make business brisker in Dorchester and vicinity."

Chignecto Post Nov. 28, 1889 A Boston company is about to open the old shale works of the Westmorland and Albert Mining and Manufacturing Company, at Rockland Bridge. Buildings and machinery are being erected, and it is intended to work the mines extensively. Dorchester Mines may get boom as of old."

S.J. Daily Sun - Jul. 5, 1890 ADVERTISEMENT: The Westmorland and Albert Mining And Manufacturing Company, Notice is hereby given that there will be held on the 8th day of July next Stockholders and Directors' meetings at the office of the Company, Brown's Block, Moncton, N.B., for the purpose of altering the bye-laws and transacting such other business as may regularly come before said meetings, Dated, Moncton, June 16th, A.D., 1890. Joseph A. Harris, Secretary and

Royal Gazette - May 9, 1860 Cap. LXXXIII. An Act to incorporate the Westmorland and Albert Mining and Manufacturing Company. Section. Section. 1. Company incorporated. 5. Liability for debts. 2. First meeting, time and 6. Act void if 25 perplace of. cent of capital be not 3. Capital, amount and division subscribed within one into shares. year. 4. Liability of

stockholders for stock subscribed. Passed 9th April 1860. Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. That Oliver Jones, Frederick Wiggins, Enoch Lunt, William H. Adams, William Smith, and their associates, successors, and assigns, shall be and they are hereby declared to be a body corporate and politic, by the name of ""The Westmorland and Albert Mining and Manufacturing Company,"" and by that name shall have all the general powers and privileges made incident to a Corporation by Act of Assembly of this Province, for the purpose of mining Coal, Shale, Asphalt, or Asphaltic Rock, and for manufacturing and trading in Oils and other illuminating or lubricating substances, and such other business as may be incident thereto. 2. The first meeting of said Corporation shall be held at such time and place in this Province as may be appointed by a majority of the above named persons. 3. The capital stock of the said Company shall be one hundred and twenty thousand pounds, divided into twelve thousand shares of ten pounds each. 4. Each and every shareholder in said Corporation shall be held liable to the said Corporation for each and every call or assessment made, not however to exceed in amount the stock subscribed by him, for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, for the purposes of, or to carry on the operations for which the said Company is incorporated; which call or assessment may be sued for and recovered in any Court of Record within the Province. 5. That the joint stock and property alone of the said Corporation shall be responsible for the debts and engagements of the same. 6. Unless twenty five per cent of the capital stock shall be subscribed within one year after the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation shall terminate."

S.J. Standard - Aug. 14, 1911 To Work The Shale Deposits In Albert. - New Brunswick Portland Cement Corporation, Ltd., Will Be Organized Here in a Few Days. - A meeting of local capitalists will be held in a few days for the purpose of furthering the organization of the New Brunswick Portland Cement Corporation Limited. Application for incorporation has been made to the Federal Government, and it is intended to raise $1,000,000 to carry on the enterprise. Senator Domville is actively interested in the organization of the company. It is intended to utilize the oil shales at the Albert county mines for the purpose of manufacturing cement, and it is said that the company will be able to produce cement at a cost of 50 cents a barrel. The company will not need coal as the gas in the rock will provide the necessary fuel. Experiments have shown that a ton of shale will give 16,400 British thermal units, while a ton of coal only gives 13,400 units."

S.J. Standard - Sep. 11, 1911 The Development in Albert County. - Senator Domville returned on Saturday from Albert county, where he has been inspecting the progress of the developments in connection with the project to establish a cement plant. 'Quite a force of men have been at work testingthe extent of the limestone deposits, and everything is going ahead in a satisfactory manner,' he said to the Standard. 'Near Demoiselle Creek they have discovered an immense are of limestone, and the analysis made from borings is entirely satisfactory. 'We have an inexhaustible supply of all the materials necessary for manufacturing cement, and we will go ahead with the development of our plant as soon as possible. Our plant will be erected on the main road between Hopewell and Albert Mines, and will give employment to a large number of men. 'We will be able to use the oil in the shale deposits for fuel and will manufacture the best kind of cement at a cost which will enable us to meet any possible competition.'"

Kings County Record - Aug. 12, 1921 New Brunswick in Line For Big Development. - Kings County Will Get a Big Boost if Cement Works Are Established. - Understood That Options on Properties Will be Taken Up. - Outlook Good. - For some months representatives of the Canada Cement Company have been looking over the lime deposits of the parish of Havelock with a view to determining the quality of the rock at that place. Borings have been made in many directions and it is understood that the investigations have been most encouraging. The lime formations of Kings are very extensive and cover a very wide section. Several years ago, while boring for gas at Sussex, the drills were forced through limestone for over 1000 feet. This is the same reef which extends across the county from St. John to Westmorland. The quality of the limestone in the parish of Havelock, however, is said to be particularly good and it is this part of the great bed that the cement people have their eye on. In addition to extensive lime deposits, there also large bodies of oil shales in evidence. The drills located these to a depth of 150 feet in some places and had then not reached the limit. When it is stated that the promoters of the big Albert oil shale deposits have been assured that the refuse remaining after the oil is extracted provides one very necessary ingredient for the manufacture of cement, the presence of large bodies of shales near the limestone of Havelock, makes the proposition a most attractive one. Clay and marl are the two essentials for good cement, and Havelock is said to have them not only in quantity but in quality. For some time past the promoters of the big cement proposition have had options on a number of properties which they will require to give effect to their plans. Having satisfied themselves that the raw materials are available, it is understood that they are now taking up such land as they require and that the negotiations are now being closed, with every likelihood of a big cement proposition being put through sooner or later. A big cement plant at or near Havelock would give that section of the county a big boost. The cost of construction alone would run into millions of dollars and the wages paid out each year would reach high figures. One of the best plants in the chain run by the Canada Cement Company is at Hull, opposite the Dominion Parliament Buildings. There the company found an ideal condition, with an endless deposit of marl and across the C.P.R. tracks, which skirt the property, acres of the finest clay. At other cement plants it is found necessary to haul one or the other of the ingredients considerable distances by rail, thus adding to the cost of production. At Havelock, it is understood that this element in

boosting the cost charges will be eliminated. Quite apart from the benefits which will follow to Havelock, should the big plant be located there, the Maritime Provinces should reap advantages as a whole. The big transportation charges on cement brought from Upper Canada would be cut off, and result in cheaper cement."

Codes: LIME / F7 / GEOL / IDX_Names: Lime - General; Restigouche County Coal; Geology - General;
Royal Gazette - Nov. 12, 1842 To His Excellency Sir William MacBean George Colebrooke, K.H., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency, In compliance with Your Excellency's instructions, I haveproceeded to explore the Restigouche River, with some of its tributaries, and the surrounding country, a full account of which will be contained in the general report on the settlement lands. My son ascended the St. John to Madawaska, where he procured provisions, canoe and guides, to enable him to cross the waters of that River, to those of the Restigouche. Having ascended Grand River, and one of its branches to the distance of twenty miles, the canoe was carried across a portage of three miles, and launched in the Waagan, a tributary of the Restigouche, one hundred and thirty miles from its mouth. A Canal might be opened at a moderate expense in this quarter, to connect the waters of the St. John with those of the Bay Chaleur. I ascended the Restigouche and examined the country on each of its sides, and met the expedition from above a short distance below the mouth of the Upsalquitch. The difficulties of descending from the sources of the river at the present time of the year, are very considerable; as the season has been very dry we were compelled to drag our canoes nine miles along the bed of the upper part of the stream, and so great is the difference of climate in the wilderness, that ice was frozen half an inch in thickness in the upper part of the stream on the 12th of September, while at the mouth of the river no frost had been seen, and luxuriant crops of wheat were in full harvest. We were surprised to observe that the stream which has been generally understood to be the Restigouche, and is so called by the English inhibitants, is only a branch of the Main river. The Main River on some of the maps is called the Cadamkiewa, and Tom Kedgewick. The Indian name in the Micmac language is Pee-tam-kedge-wee. The southwesterly branch of the river above its junction with the larger stream is called by the Micmacs A-waan-jeet. The former stream is one third larger than the latter, and is eighty yards wide where it meets its chief tributary. It may be remarked here that where a river is forked, the Indians give a distinct name to each branch without reference to the name of the stream below. One of the sources of the main Restigouche or Pe-tam-kedge-wee, is near Tamisquata Lake, another approaches the Metis Lake very nearly. If the main Restigouche be the boundary between the Provinces, it will be seen by the reference to a good map, that a large tract of country will fall to New Brunswick, which has heretofore been considered to be on the Canada side; and it will also be seen that the outline of both Provinces will be very irregular and by no means convenient. On the Peninsula separating the River St. Lawrence from the Bay Chaleur, there is a lofty mountainous ridge - a branch of a chain called the Alleghenies, which extend through the United States. It was up to this ridge that the American Government laid their claim before the question of the Disputed Territory was settled, and until that period, the Restigouche formed a temporary boundary between Canada and New Brunswick; but since the happy terminations of that dispute, the range of Mountains separating the rivers that flow into the St. Lawrence, from those that flow into the Bay Chaleur, the Restigouche, and St. John, will in my opinion, form the best divisional line between the Provinces. Such a line would give to each Province all the rivers that flow and open into their respective districts, and would agree with the physical geography of the Country. The Restigouche forms an inconvenient boundary between the Provinces; all the timber cut upon the tributaries of that stream is shipped from Dalhousie and Campbellton on the New Brunswick side. The only land communication between the districts of Gaspe and Quebec, is along the Kempt or Metis Road, where a mail passes once a week. This road has never been opened and improved to any great extent. The Mail carrier rides about sixty miles on horseback, from the Restigouche to the Matapedia Lakes, where he feeds his horse on wild hay, and walks upwards of forty miles, to the mouth of the Metis River. This line of road runs through a very mountainous and broken tract of Country. The opening of a road from Fredericton to some part of the Restigouche is a matter of much importance to the Province. The lower part of the Restigouche is fit for cultivation, and southward of the Pee-tam-kedge-wee, or upper part of the Restigouche, the land becomes level. The soil on the Restigouche is of a good quality and produces excellent crops of all kinds of grain. The Restigouche is navigable for tow-boats andcanoes one hundred and twenty miles from its mouth. The Matapedia is then navigable fifty miles, and the Upsalquitch seventy miles. The district abounds inlimestone and marl, and there is a coal field near Campbellton. In bringing this communication to a close I beg to assure Your Excellency that I shall take the earliest opportunity to make up the general report of the Restigouche, which will include a full account of its minerals and other natural resources. I have the honor to be, Your Excellency's most obedient and very

Grand Lake Coal;
S.J. Daily Sun - Nov. 4, 1890 An Open Letter. - To the Common Council and the Board of Trade of the City of St. John. - … New Brunswick Coal. - With expensive machinery, now available, Grand Lake coal can be stripped very cheaply. According to geological reports the supply of coal near the lake is over 150,000,000 tons, with extensive deposits further east and north. …The Iron Industry. - With our localsupplies of iron ores, coal, limestone and fire-clays,and the coal and iron ores that may be brought from Nova Scotia and elsewhere by barge at nominal freights, and with iron ores in Ontario and Quebec, St. John, with its low summer temperature and its numerous competing waterways and railways, is unsurpassed in Canada as a centre for the iron industry in all its branches, and for preparing of or manufacturing from, fire and other clays, cement rock, mussel rock, red and grey granites, freestone, limestone, gypsum, slate and lumber, etc.

Codes: LIME / X1 / IDX_Names: Lime - General; Grand Lake Coal;
S.J. Daily Sun - Dec. 14, 1894 Grand Lake Coal. - (Fredericton Gleaner). - From twenty to thirty tons of Nova Scotia coal for the chemical pulp works at Chatham are daily passing over theCanada Eastern. Twenty dollars per day paid to the miners at Newcastle may seem a small item, but a great deal larger amount would be paid to them if the railroad from Fredericton to the Newcastle coal fields via the Canada Eastern were constructed. The latter road would use from six thousand to eight thousand tons per year, while the C.P.R. would be a good customer for steam and forge coal. Cheap coal at Fredericton, so conveniently situated as it is with respect to the other portions of the province, would mean greatly increased prosperity for this city. With better facilities for manufacture of chemical pulp than Chatham, we have the same railway which supplies the Chatham pulp manufactory to supply us with the best of pulp wood; in addition, the Canadian Pacific can bring vast quantities of wood from Keswick and other places. While Chatham has to bring its lime very often by rail, we can get it directly from St. John as a return freight for Mr. Gibson's barges. Probably no better place could be found in the dominion for the erection of the chemical pulp works than on the banks of the St. John river at Fredericton, provided only that there was connection between that place by rail with the very extensive coal fields of Newcastle. When this is done we predict a period of unexampled prosperity to Fredericton and the surrounding country. We had almost forgotten to mention that pulp mills at Fredericton would not only use up all the slabs and other waste wood resulting from the mills here, but every little mill up the St. John river could float its refuse wood to such an establishment. With the introduction of cheap fuel, many other branches of industry would spring up, such as the manufacture of tiles for drainage pipes, fertilizer works, and many other industries in which fuel is a matter of prime necessity. Just now it would be well for the city council to give this matter its attention. Let this road be commenced from the line of the Canada Eastern, instead of from Newcastle."

Carleton Sentinel - Jun. 4, 1850 Report on the Agriculture Capabilities of New Brunswick (#4) by J.F.W. Johnston, F.R.S., &c. In the Geological Map, No. 1, attached to the Report, it will be seen that, a large breadth of the province rests on what are called the Coal Measures.These strata or beds of rock are of the same general age as those in which the productive coal beds of Nova Scotia, of Prince Edward Island, of England, and of the United States occur, and they contain in various places the seams of coal which are to be seen in many parts of the Province. Attempts have been made, from time to time to work these beds, especially on the Grand Lake, the Memramcook, the Petitcodiac, the Salmon River, the Coal Creek, of the Saint Nicholas River, and in other localities; all these attempts however, owing in part to the thinness of the seams, to the impurity of the coal, and to their occasional high inclination, have failed to raise the mineral in any considerable quantity, or to yield a reasonable profit to the undertakers. The existence of available beds of coal in the Province, has hitherto been looked upon more in an exclusively manufacturing and mercantile, than in an agricultural light. Iron ore is said to be abundant, and if coal could be found to smelt it, centres of industry would spring up which would enhance the price of agricultural produce in their neighborhood. This is true, but the actual existence of the coal would render unnecessary the large growth of wood for fuel, and would thus set free a great extent of land for the exercise of rural industry and the growth of corn. On the other hand, if this iron is to be smelted with wood, the extent of the manufacture, however desirable in other respects, would greatly increase the demand for fuel, or of land to be kept in perpetual forest, and would in like proportion lessen the agricultural resources of the Province. The existence and possibility of profitably working beds of coal in New Brunswick, is as important therefore to the agricultural as it is to the other interests - to the development of the agricultural resources of the different parts of the Province, and to the formation of anything like a correct estimate of the extent of these resources. In reading over Dr. Gesner's reports in regard to the Geology of the Province, I have been struck with the labour he has felt himself obliged to expend year after year in exalting the dignity of geological science, its money value in discovering natural resources of a country, and its consequent claims upon general consideration and support; like all men whose fate is to pioneer the way to new views, new studies, and new habits of thought, he evidently writes as if he felt his work to be very much up-hill - as if he were labouring for men who did not generally understand or appreciate his task, and he was therefore induced occasionally to minister a little too strongly to the vulgar views of immediate profit from scientific enquiry, and thus to create expectations which his own labours did not realize. This was especially the case in regard to the richness of the coal fields of New Brunswick. From all I have seen or learned, the opinions he expressed and the hopes he awakened on this subject were much too sanguine and in a considerable degree exaggerated. This proved unfortunate in many ways; it has not only injured his own reputation for general accuracy, and diminished the confidence with which his Reports generally were read, but it lessened the confidence of the people in the predictions of the science generally, and probably prevented or retarded other researches which might have been undertaken in reference to the Geology and Mineralogy of the Province. With a view to placing before Your Excellency at a glance, a summary of all that is yet known of the coal deposits in New Brunswick, I have requested my friend Dr. Robb to fill up the following table, (No.1). The materials are derived chiefly from Dr. Gesner's reports, but the principal observations of Dr. Robb and myself are also included. From this table and the report annexed to it, it appears that nearly all the seams that have been discovered are very thin, that such as are thicker are represented to be poor in quality, and that very little coal has yet been extracted or is likely to be profitably obtained from them. Many of those varieties called cannel and gascoal appear to be only bituminous shales which leave an ash

nearly as bulky as the original coal. The gas coal ofthe Memramcook River is of this kind, and its quality for the manufacture of gas may be judged of from the fact that a ton of it yields only a thousand pounds of gas, as tried in the Saint John gas works, while the best qualities of English and Scotch cannel, and of Behimmon's coal from the County of Durham in England, yield 12,000 cubic feet. The discovery said to have been made of a thickbed of bitumen on Frederick's Brook, in Albert County, is very interesting, and should reports not be exaggerated, will undoubtedly prove a source of profit. Fredericton, 26th Nov. 1849 Sir. - In compliance with your request that I should prepare a ""short notice of the existence of coal in New Brunswick, and its consequences in the Colony as derived from my own observations and enquiries, and the published reports of Dr. Gesner,"" I have drawn up the following Report:- More than one third of the area of New Brunswick is occupied by rocks whose composition and contents, both 3 mineral and fossil resemble those peculiar to that which as a whole has been termed the Carboniferous system of rocks. A great portion of the space occupied by them, say seven or eight thousand square miles, has been termed by Dr. Gesner the ""Great New Brunswick Coal Field."" Its area is very considerable, although it is not ""one of the largest ever discovered upon the globe."" (Rep. IV. p.64) The Illinois coal field, says Sir C. Lyell, is about as large as the whole of England, (Travels in N.A., I.28;) and the area of the Appalachian coal field, according to Prof. H. Rogers, ""upon a moderate estimate amounts to sixty three thousand square miles."" (Trans. Assoc. Am. Geology, I. 436). The carboniferous rocks of New Brunswick form but part of that series, which as a whole has been termed by Mr. Logan and others the Eastern coal field of North America. The rocks of this series first appear on the northern margin of the Bay de Chaleur, (and probably at one period occupied the whole of it,) thence pass deeply into the interior of New Brunswick and Nova Scotia, and constitute no inconsiderable portion of the Islands of Prince Edward, Cape Breton and Newfoundland. The rocks or measures which constitute this system are conglomerates, sandstones and shales of various degrees of fineness and purity, and of various colours, but all obviously deposits from water. Subordinate to these we have beds of limestone, coal and plaster, and occasionally ores of iron, copper and manganese. In many other countries there is a very exact line of demarcation recognized between the rocks of the coal series and those above and below it, but in this country there is still considerable difficulty in defining the limits of these respectively; and although I consider most of the sandstones, conglomerates and shales of New Brunswick to belong to the carboniferous system of rocks, this term must for the present be construed so as to include the true coal measures and others below them as far as the old red sandstone or Devonian series, as understood by Sir C. Lyell and other Geologists. By the observations of Lyell, Brown and Dawson, in Nova Scotia and Cape Breton it would appear that the carboniferous system of the eastern portion of North America may be divided into three groups or formations, each of which is no less than six thousand feet in thickness, - these are - 1st, an upper, consisting chiefly of reddish measures, with two thin beds of coal and one of gypsum, a middle, which consists of gray and brown sandstone with workable beds of coal and ironstone; 3rd. a lower consisting chiefly of reddish sandstones and conglomerate with a few thin seams of coal, and with much plaster and limestone. In Dr. Gesner's reports on the Geology of this Province, red rocks, or rocks accompanied with plaster, have generally been termed new red sandstone, and have been said to overlie the coal measures; but if the red rocks which contain the plaster, really underlie the productive coal measures of New Brunswick as in Nova Scotia and Cape Breton, and as I suspect they do, a revision of the matter will be required; at present there is much difficulty in making use of this data regarding the order of superposition in this part of our series of rocks. Speaking of the consequences of Coal in this Colony, Dr. Gesner says (Rep. IV, 18) - ""The immense but unexplored deposits of coal in the Province are sufficient to supply Canada and all the demands of the existing coasts of the Gulf; they are capable of sustaining manufactories, railroads and steam communication to an extent scarcely to be contemplated in the present day, and they will also support a trade with other parts of the world."" Further he adds (IV. 64) that ""when it is considered that one third part of this country contains more or less of the bituminous mineral, the quantity of coal in New Brunswick will appear inexhaustible;"" - and in another report to the Legislature, when speaking of the same subject, he says, ""when all the circumstances are duly considered, it may be seen of what importance New Brunswick is destined to become, not only to herself and her sister Colonies, but to great Britain and the United States, whose supplies of Coal must, to a great extent, be dependent on these colonial resources."" (III. 36). In order to afford more definite ideas concerning the beds of coal actually known to exist in the Province, and to enable us to estimate at its real value the ground work of the many vague assertions which from time to time have been made concerning this department of our mineral resources, I propose to bring together short notices of all the known outcroppings of coal in the different counties of the Province.York.-1. An outcropping of coal, resting on fire clay, may be seen at a side cut on the right bank of the River Nashwaak, nearly opposite Mr. McLean's farm; the coal does not seem to be more than a few inches in thickness, and could not be worked with any profit there. 2. On the Tay Creek, a branch of the Nashwaak, coal has long been known to exist. In walking up the stream, from its mouth, drift pieces are found occasionally, and then become larger and more abundant till we reach a bend in the river, under a high bank of gray sandstone, above which no more coal is observed; hence it is supposed that the outcrop is near, and as it is not in the cliffs it must be in the bed of the brook, where, however, I did not detect it. Some of the pieces found near this place were about ten inches thick, though it is possible that 5 the proper seam may have been thicker. The dip of the sandstones was easterly, and very low, so that the coal may have been connected with the seam seen on the Nashwaak. 3. I have a specimen of coal from land near McLeod's Hill, on the Royal Road; but I am informed, on good authority, that the seam from which it came is thinner than either of the above. 4. Dr. Gesner (IV. 26) considers ""it is far from being improbable that coal might be procured at the very capital of the Province, although the rocks themselves offer but few indications of its existence near the surface."" As the rocks near Fredericton have an easterly dip, and as there are no appearances of coal in the sandstones, which run out a short distance to the westward, we are hardly warranted, as yet, in supposing that coal will ever be mined at this locality. 5. I have long understood that coal has been got on Lyon's Creek, a small tributary to the Oromocto River, and that it had been used by a blacksmith near Hartt's Mills; on making further enquiry, however, I found that it was only a few inches in thickness, and therefore unavailable. I presume that this is the bed alluded to by Dr. Gesner, (I. 71) of which he says, ""the coal is only four inches thick, and appears on the bank of the river between strata of bituminous shale, where fossil remains are abundant; that there are thick beds of coal beneath, however,"" he adds ""there can be no doubt."" Enough is said to excite the imagination, but not to satisfy the reason. Sunbury. -Exploratory surveys and boring for coal were undertaken some years ago in the Parish of Burton, but in no case, I believe, was workable coal discovered. Queen's. -1. I have understood that some borings were made near Gagetown, but they were unsuccessful. Dr. Gesner (I. 73) observes that ""no doubt can be entertained that Coal may be procured in the County adjacent to Fredericton and Gagetown."" This remains still to be seen. 2. Coal has been got on the Grand Lake for upwards of forty years, but as yet there are no workings of any extent in any part of its valley. The coal occurs near the head of the Lake, and at present it is chiefly worked on the Shore Road, south of the Newcastle Creek; the workings are either open to the day, or adits run in from the side of the hill, on the rise of the measures, which dip towards the lake at an angle less than 10ø. At one of the levels the section observed by me was as follows:- Clay drift of surface 8ft. 0in. Shaly sandstone 1 6 White clay 0 8 Fire clay 4 0 Coal with pyrites 0 4 6 Black clay (sheepskin) 0 1 1/2 Coal (main seam) 1 3 Underclay (pavement rock) unknown -------- 15 10 1/2 At another place, where the measures were seen at a ""stripping,"" or open digging, the appearances were as follows:- Red clay 1 ft. 1 in. Soft yellow clay 3 6 Hard yellow clay (coal rock) 3 0 Blue shale 1 6 Coal 0 4 Black clay 0 2 Coal 1 6 Underclay unknown --------11 0 As may be supposed, the mining operations are all carried on in a small and rude manner, yet, from time to time, I believe that nearly 2000 chaldrons per annum have been brought to market. Within twenty years all the coal was got by strippings, or open diggings, but since that it is chiefly got out by adits and levels; of these there are a great many on the Newcastle Creek, on Salmon River and on Coal Creek. The settlers of the vicinity used to go into these mines during the winter instead of going into the woods. Messrs. Berton Brothers of Saint John, have recently taken out mining leases and wrought the coal on a somewhat more extensive scale. The coal is bituminous, and cakes or fuses when heated, so as to form a hollow fire admirably fitted for blacksmith's use, but less for ordinary grates, without frequent stirring. The Grand Lake coal now brought to market is much better cleaned from pyrites (""sulphur"") and clay than it used to be formerly, and I believe that it is preferred by the Saint John blacksmiths to any of the imported varieties. The uniform quality, thickness and depth of the coal got at the Lake district, lead to the conclusion that one bed only has been opened as yet. Dr. Gesner says, however, (III.72) ""there can be no doubt that there are other and far richer deposits of coal beneath the one already discovered, but at what distance from the surface it is impossible to calculate, in consequence of the almost horizontal position of each stratum in the coal series."" If the outcrops of other and far richer deposits of coal had been known - if they had dipped towards the quarter alluded to - and if they had not suffered much denudation, the above expression would have been more justifiable than they appear. An exploratory boring was undertaken in 1837, by the Salmon River Coal Company, at a cost of œ2000, but 7 the returns (supposing them to be correct) gave but little promise of upwards of 400 feet, and in this Distance a few thin seams of coal were passed through, and one of bituminous shale and coal, 8 feet thick was reported; nothing further was done, and the company broke up. 3. Coal has been found on the Washademoak River near the mouth of Long's Creek - its thickness is about a foot, and according to Dr. Gesner (III. 60) ""is probably accompanied by more valuable deposits than have yet been discovered."" 4. Coal has also been reported as occurring on the New Canaan River, another branch of the Washademoak, but it is not unlikely that both this and the former may be part of the same bed as that seen at the Grand Lake. King's. -1. In Dr. Gesner's second report (p.63) it is mentionedthat the rocks of the Westmorland coal field occur at Ward's Creek, a small stream which flows from the south and joins the Salmon River at Sussex Vale. At the farm then held by Mr. A. Sheck he reports ""a stratum of impure cannel coal, about three feet in thickness, and from the qualities of this kind of coal mingled with the debris of the surface, it is evident that it exists in much greater quantities and a quality more pure in situations now concealed by beds of sand and other detrital matter."" This stratum, accompanied by a fine grained sandstone, containing remains and impressions of plants of the coal period, was observed towards Dutch Valley, and, as Dr. Gesner adds, ""although the largest and most important beds of coal remain undiscovered, yet an advancement is made towards their development."" (p. 64) In 1847 I had an opportunity of visiting the farm mentioned above, and then I found a brownish bituminous shale or slate in contact with a sandstone containing remains of what appeared to be fucoids. We made a wood fire, and got the former to burn; still there was too much earthy matter present to entitle it to be included under the head of coal. Albert. -1. In the Pollett River about fifteen miles from where it joins the Petitcodiac river, small seams of coal appear in its bed, and some drift coal is found in theneighborhood. Dr. Gesner (II.65) observes in regard to this case ""that it is abundant in the concealed strata beneath, appears very evident."" Coal may or may not be abundant underneath, although it is hardly fair to require us to admit that it is very evident that it is either one or the other. 2. In the following pages of the same Report, coal is stated to appear at the head of Turtle Creek, and ten miles N.N.W., from Shepody; it was likewise seen on Mr. Stephens' land where a stratum of coal ten feet in thickness was observed in the bed of a brook; the coal 8found in this vicinity is said to be of a much superior quality to any along the whole line of outcropping, it kindled quickly, and afforded a greater quantity of carburated hydrogen gas than any of the imported varieties. The earthy matter varied in quantity from twelve to twenty-five per cent, and the ashes contained carbonite of lime. The outcrop of this coal was within five hundred yards of trap and syenite, which form a steep and high declevity along its southern edge to the distance of ten miles. Although the proportion of ashes above stated is very large, the above mentioned stratum must be regarded as one of considerable importance, and I regret that I had not an opportunity of seeing it with you when we were in Albert county together. It ought to be tried experimentally at the Saint John gas works or elsewhere. 3. Dr. G. (III. 28) mentions the occurrence of a bed of coal at Frederick's Brook, a branch of Weldon's Creek, which flows into the Petitcodiac river, in the Parish of Hillsboro'. It exists, he says, ""in several separate strata, the largest of which is about nine feet in thickness."" The quality of this coal is stated to be superior to that of the Memramcook or Stephen's farm, mentioned above; a quantity of it was collected and fired in the bed of the stream, it ignited readily and burned with great splendour; the strata consisted of sandstone, slate, bituminous shale and coal which ran E. and W. with a southerly dip. I visited this place in October last, and found on Mr. Steeve's land, near the bend of Frederick's Brook, a good deal of brownish bituminous shale, but no coal whatever. Subsequent to the period of Dr. Gesner's Report, a boring had been made for coal by Messrs. Bryant and Sherer; we saw some of their old works near the edge of the brook where they had bored to a depth of 40 feet, but without finding any coal. Mr. Steeves showed me what had been regarded as coal, but it proved to be Mineral Pitch or hard bitumen; it had only been found, he said, in small rolled fragments in the surface drift of his fields. The occurrence of this mineral in New Brunswick is interesting, but it was impossible for me in a hurried visit to attempt to discover its proper site. 4. Coal occurs on Mr. Richardson's land, at Cape Enrage, in Chignecto Bay; you yourself visited it in October last, and informed me that it was of the common kind, about eight inches thick, and occurring with the usual shales and sandstones, which dip at a very high angle; that the coal section was very good, and that if other beds had existed, besides the above, they would have been readily seen. (II.23) 5. At Salmon River, further west, and on land belonging to Mr. Foster, coal was spoken of also, but it was said to be impure and of small extent. 6. On the south side of Grindstone Island, Dr. G. reports 9 ""several seams of soft red shale with narrow seams of coal."" The course of the strata is W., and the dip S 40ø; although there are indications of coal at several localities, no out-cropping of any practical value was discovered on the shore. (-- 25.) Westmorland. -1. On Taylor's farm on the west side of the MemramcookRiver, four miles above Dorchester, there is a good natural section of the coal measures; the dip is S.S.E. and nearly 40ø. Here occurs a bed of highly bituminous shale 4 1/2 feet thick, into which an adit has has been made by Mr. Steadman; it ran in, on the dip, for forty or fifty feet, and if followed much farther in the same direction would issue below high water mark; about 200 tons of the mineral were piled on the bank for shipment. It is easily set fire to and blazes readily, but leaves an ash nearly as bulky as the original piece. Scotch cannel leaves about 4 per cent. of ashes. I have heard that this substance has been tried at the Saint John Gas Works, but was not considered suitable there; it ought to be

Carleton Sentinel - Jun. 4, 1850 Report on the Agriculture Capabilities of New Brunswick (#4) by J.F.W. Johnston, F.R.S., &c. In the Geological Map, No. 1, attached to the Report, it will be seen that, a large breadth of the province rests on what are called the Coal Measures.These strata or beds of rock are of the same general age as those in which the productive coal beds of Nova Scotia, of Prince Edward Island, of England, and of the United States occur, and they contain in various places the seams of coal which are to be seen in many parts of the Province. Attempts have been made, from time to time to work these beds, especially on the Grand Lake, the Memramcook, the Petitcodiac, the Salmon River, the Coal Creek, of the Saint Nicholas River, and in other localities; all these attempts however, owing in part to the thinness of the seams, to the impurity of the coal, and to their occasional high inclination, have failed to raise the mineral in any considerable quantity, or to yield a reasonable profit to the undertakers. The existence of available beds of coal in the Province, has hitherto been looked upon more in an exclusively manufacturing and mercantile, than in an agricultural light. Iron ore is said to be abundant, and if coal could be found to smelt it, centres of industry would spring up which would enhance the price of agricultural produce in their neighborhood. This is true, but the actual existence of the coal would render unnecessary the large growth of wood for fuel, and would thus set free a great extent of land for the exercise of rural industry and the growth of corn. On the other hand, if this iron is to be smelted with wood, the extent of the manufacture, however desirable in other respects, would greatly increase the demand for fuel, or of land to be kept in perpetual forest, and would in like proportion lessen the agricultural resources of the Province. The existence and possibility of profitably working beds of coal in New Brunswick, is as important therefore to the agricultural as it is to the other interests - to the development of the agricultural resources of the different parts of the Province, and to the formation of anything like a correct estimate of the extent of these resources. In reading over Dr. Gesner's reports in regard to the Geology of the Province, I have been struck with the labour he has felt himself obliged to expend year after year in exalting the dignity of geological science, its money value in discovering natural resources of a country, and its consequent claims upon general consideration and support; like all men whose fate is to pioneer the way to new views, new studies, and new habits of thought, he evidently writes as if he felt his work to be very much up-hill - as if he were labouring for men who did not generally understand or appreciate his task, and he was therefore induced occasionally to minister a little too strongly to the vulgar views of immediate profit from scientific enquiry, and thus to create expectations which his own labours did not realize. This was especially the case in regard to the richness of the coal fields of New Brunswick. From all I have seen or learned, the opinions he expressed and the hopes he awakened on this subject were much too sanguine and in a considerable degree exaggerated. This proved unfortunate in many ways; it has not only injured his own reputation for general accuracy, and diminished the confidence with which his Reports generally were read, but it lessened the confidence of the people in the predictions of the science generally, and probably prevented or retarded other researches which might have been undertaken in reference to the Geology and Mineralogy of the Province. With a view to placing before Your Excellency at a glance, a summary of all that is yet known of the coal deposits in New

Brunswick, I have requested my friend Dr. Robb to fill up the following table, (No.1). The materials are derived chiefly from Dr. Gesner's reports, but the principal observations of Dr. Robb and myself are also included. From this table and the report annexed to it, it appears that nearly all the seams that have been discovered are very thin, that such as are thicker are represented to be poor in quality, and that very little coal has yet been extracted or is likely to be profitably obtained from them. Many of those varieties called cannel and gascoal appear to be only bituminous shales which leave an ash nearly as bulky as the original coal. The gas coal ofthe Memramcook River is of this kind, and its quality for the manufacture of gas may be judged of from the fact that a ton of it yields only a thousand pounds of gas, as tried in the Saint John gas works, while the best qualities of English and Scotch cannel, and of Behimmon's coal from the County of Durham in England, yield 12,000 cubic feet. The discovery said to have been made of a thickbed of bitumen on Frederick's Brook, in Albert County, is very interesting, and should reports not be exaggerated, will undoubtedly prove a source of profit. Fredericton, 26th Nov. 1849 Sir. - In compliance with your request that I should prepare a ""short notice of the existence of coal in New Brunswick, and its consequences in the Colony as derived from my own observations and enquiries, and the published reports of Dr. Gesner,"" I have drawn up the following Report:- More than one third of the area of New Brunswick is occupied by rocks whose composition and contents, both 3 mineral and fossil resemble those peculiar to that which as a whole has been termed the Carboniferous system of rocks. A great portion of the space occupied by them, say seven or eight thousand square miles, has been termed by Dr. Gesner the ""Great New Brunswick Coal Field."" Its area is very considerable, although it is not ""one of the largest ever discovered upon the globe."" (Rep. IV. p.64) The Illinois coal field, says Sir C. Lyell, is about as large as the whole of England, (Travels in N.A., I.28;) and the area of the Appalachian coal field, according to Prof. H. Rogers, ""upon a moderate estimate amounts to sixty three thousand square miles."" (Trans. Assoc. Am. Geology, I. 436). The carboniferous rocks of New Brunswick form but part of that series, which as a whole has been termed by Mr. Logan and others the Eastern coal field of North America. The rocks of this series first appear on the northern margin of the Bay de Chaleur, (and probably at one period occupied the whole of it,) thence pass deeply into the interior of New Brunswick and Nova Scotia, and constitute no inconsiderable portion of the Islands of Prince Edward, Cape Breton and Newfoundland. The rocks or measures which constitute this system are conglomerates, sandstones and shales of various degrees of fineness and purity, and of various colours, but all obviously deposits from water. Subordinate to these we have beds of limestone, coal and plaster, and occasionally ores of iron, copper and manganese. In many other countries there is a very exact line of demarcation recognized between the rocks of the coal series and those above and below it, but in this country there is still considerable difficulty in defining the limits of these respectively; and although I consider most of the sandstones, conglomerates and shales of New Brunswick to belong to the carboniferous system of rocks, this term must for the present be construed so as to include the true coal measures and others below them as far as the old red sandstone or Devonian series, as understood by Sir C. Lyell and other Geologists. By the observations of Lyell, Brown and Dawson, in Nova Scotia and Cape Breton it would appear that the carboniferous system of the eastern portion of North America may be divided into three groups or formations, each of which is no less than six thousand feet in thickness, - these are - 1st, an upper, consisting chiefly of reddish measures, with two thin beds of coal and one of gypsum, a middle, which consists of gray and brown sandstone with workable beds of coal and ironstone; 3rd. a lower consisting chiefly of reddish sandstones and conglomerate with a few thin seams of coal, and with much plaster and limestone. In Dr. Gesner's reports on the Geology of this Province, red rocks, or rocks accompanied with plaster, have generally been termed new red sandstone, and have been said to overlie the coal measures; but if the red rocks which contain the plaster, really underlie the productive coal measures of New Brunswick as in Nova Scotia and Cape Breton, and as I suspect they do, a revision of the matter will be required; at present there is much difficulty in making use of this data regarding the order of superposition in this part of our series of rocks. Speaking of the consequences of Coal in this Colony, Dr. Gesner says (Rep. IV, 18) - ""The immense but unexplored deposits of coal in the Province are sufficient to supply Canada and all the demands of the existing coasts of the Gulf; they are capable of sustaining manufactories, railroads and steam communication to an extent scarcely to be contemplated in the present day, and they will also support a trade with other parts of the world."" Further he adds (IV. 64) that ""when it is considered that one third part of this country contains more or less of the bituminous mineral, the quantity of coal in New Brunswick will appear inexhaustible;"" - and in another report to the Legislature, when speaking of the same subject, he says, ""when all the circumstances are duly considered, it may be seen of what importance New Brunswick is destined to become, not only to herself and her sister Colonies, but to great Britain and the United States, whose supplies of Coal must, to a great extent, be dependent on these colonial resources."" (III. 36). In order to afford more definite ideas concerning the beds of coal actually known to exist in the Province, and to enable us to estimate at its real value the ground work of the many vague assertions which from time to time have been made concerning this department of our mineral resources, I propose to bring together short notices of all the known outcroppings of coal in the different counties of the Province.York.-1. An outcropping of coal, resting on fire clay, may be seen at a side cut on the right bank of the River Nashwaak, nearly opposite Mr. McLean's farm; the coal does not seem to be more than a few inches in thickness, and could not be worked with any profit there. 2. On the Tay Creek, a branch of the Nashwaak, coal has long been known to exist. In walking up the stream, from its mouth, drift pieces are found occasionally, and then become larger and more abundant till we reach a bend in the river, under a high bank of gray sandstone, above which no more coal is observed; hence it is supposed that the outcrop is near, and as it is not in the cliffs it must be in the bed of the brook, where, however, I did not detect it. Some of the pieces found near this place were about ten inches thick, though it is possible that 5 the proper seam may have been thicker. The dip of the sandstones was easterly, and very low, so that the coal may have been connected with the seam seen on the Nashwaak. 3. I have a specimen of coal from land near McLeod's Hill, on the Royal Road; but I am informed, on good authority, that the seam from which it came is thinner than either of the above. 4. Dr. Gesner (IV. 26) considers ""it is far from being improbable that coal might be procured at the very capital of the Province, although the rocks themselves offer but few indications of its existence near the surface."" As the rocks near Fredericton have an easterly dip, and as there are no appearances of coal in the sandstones, which run out a short distance to the westward, we are hardly warranted, as yet, in supposing that coal will ever be mined at this locality. 5. I have long understood that coal has been got on Lyon's Creek, a small tributary to the Oromocto River, and that it had been used by a blacksmith near Hartt's Mills; on making further enquiry, however, I found that it was only a few inches in thickness, and therefore unavailable. I presume that this is the bed alluded to by Dr. Gesner, (I. 71) of which he says, ""the coal is only four inches thick, and appears on the bank of the river between strata of bituminous shale, where fossil remains are abundant; that there are thick beds of coal beneath, however,"" he adds ""there can be no doubt."" Enough is said to excite the imagination, but not to satisfy the reason. Sunbury. -Exploratory surveys and boring for coal were undertaken some years ago in the Parish of Burton, but in no case, I believe, was workable coal discovered. Queen's. -1. I have understood that some borings were made near Gagetown, but they were unsuccessful. Dr. Gesner (I. 73) observes that ""no doubt can be entertained that Coal may be procured in the County adjacent to Fredericton and Gagetown."" This remains still to be seen. 2. Coal has been got on the Grand Lake for upwards of forty years, but as yet there are no workings of any extent in any part of its valley. The coal occurs near the head of the Lake, and at present it is chiefly worked on the Shore Road, south of the Newcastle Creek; the workings are either open to the day, or adits run in from the side of the hill, on the rise of the measures, which dip towards the lake at an angle less than 10ø. At one of the levels the section observed by me was as follows:- Clay drift of surface 8ft. 0in. Shaly sandstone 1 6 White clay 0 8 Fire clay 4 0 Coal with pyrites 0 4 6 Black clay (sheepskin) 0 1 1/2 Coal (main seam) 1 3 Underclay (pavement rock) unknown -------- 15 10 1/2 At another place, where the measures were seen at a ""stripping,"" or open digging, the appearances were as follows:- Red clay 1 ft. 1 in. Soft yellow clay 3 6 Hard yellow clay (coal rock) 3 0 Blue shale 1 6 Coal 0 4 Black clay 0 2 Coal 1 6 Underclay unknown --------11 0 As may be supposed, the mining operations are all carried on in a small and rude manner, yet, from time to time, I believe that nearly 2000 chaldrons per annum have been brought to market. Within twenty years all the coal was got by strippings, or open diggings, but since that it is chiefly got out by adits and levels; of these there are a great many on the Newcastle Creek, on Salmon River and on Coal Creek. The settlers of the vicinity used to go into these mines during the winter instead of going into the woods. Messrs. Berton Brothers of Saint John, have recently taken out mining leases and wrought the coal on a somewhat more extensive scale. The coal is bituminous, and cakes or fuses when heated, so as to form a hollow fire admirably fitted for blacksmith's use, but less for ordinary grates, without frequent stirring. The Grand Lake coal now brought to market is much better cleaned from pyrites (""sulphur"") and clay than it used to be formerly, and I believe that it is preferred by the Saint John blacksmiths to any of the imported varieties. The uniform quality, thickness and depth of the coal got at the Lake district, lead to the conclusion that one bed only has been opened as yet. Dr. Gesner says, however, (III.72) ""there can be no doubt that there are other and far richer deposits of coal beneath the one already discovered, but at what distance from the surface it is impossible to calculate, in consequence of the almost horizontal position of each stratum in the coal series."" If the outcrops of other and far richer deposits of coal had been known - if they had dipped towards the quarter alluded to - and if they had not suffered much denudation, the above expression would have been more justifiable than they appear. An exploratory boring was undertaken in 1837, by the Salmon River Coal Company, at a cost of œ2000, but 7 the returns (supposing them to be correct) gave but little promise of upwards of 400 feet, and in this Distance a few thin seams of coal were passed through, and one of bituminous shale and coal, 8 feet thick was reported; nothing further was done, and the company broke up. 3. Coal has been found on the Washademoak River near the mouth of Long's Creek - its thickness is about a foot, and according to Dr. Gesner (III. 60) ""is probably accompanied by more valuable deposits than have yet been discovered."" 4. Coal has also been reported as occurring on the New Canaan River, another branch of the Washademoak, but it is not unlikely that both this and the former may be part of the same bed as that seen at the Grand Lake. King's. -1. In Dr. Gesner's second report (p.63) it is mentionedthat the rocks of the Westmorland coal field occur at Ward's Creek, a small stream which flows from the south and joins the Salmon River at Sussex Vale. At the farm then held by Mr. A. Sheck he reports ""a stratum of impure cannel coal, about three feet in thickness, and from the qualities of this kind of coal mingled with the debris of the surface, it is evident that it exists in much greater quantities and a quality more pure in situations now concealed by beds of sand and other detrital matter."" This stratum, accompanied by a fine grained sandstone, containing remains and impressions of plants of the coal period, was observed towards Dutch Valley, and, as Dr. Gesner adds, ""although the largest and most important beds of coal remain undiscovered, yet an advancement is made towards their development."" (p. 64) In 1847 I had an opportunity of visiting the farm mentioned above, and then I found a brownish bituminous shale or slate in contact with a sandstone containing remains of what appeared to be fucoids. We made a wood fire, and got the former to burn; still there was too much earthy matter present to entitle it to be included under the head of coal. Albert. -1. In the Pollett River about fifteen miles from where it joins the Petitcodiac river, small seams of coal appear in its bed, and some drift coal is found in theneighborhood. Dr. Gesner (II.65) observes in regard to this case ""that it is abundant in the concealed strata beneath, appears very evident."" Coal may or may not be abundant underneath, although it is hardly fair to require us to admit that it is very evident that it is either one or the other. 2. In the following pages of the same Report, coal is stated to appear at the head of Turtle Creek, and ten miles N.N.W., from Shepody; it was likewise seen on Mr. Stephens' land where a stratum of coal ten feet in thickness was observed in the bed of a brook; the coal 8found in this vicinity is said to be of a much superior quality to any along the whole line of outcropping, it kindled quickly, and afforded a greater quantity of carburated hydrogen gas than any of the imported varieties. The earthy matter varied in quantity from twelve to twenty-five per cent, and the ashes contained carbonite of lime. The outcrop of this coal was within five hundred yards of trap and syenite, which form a steep and high declevity along its southern edge to the distance of ten miles. Although the proportion of ashes above stated is very large, the above mentioned stratum must be regarded as one of considerable importance, and I regret that I had not an opportunity of seeing it with you when we were in Albert county together. It ought to be tried experimentally at the Saint John gas works or elsewhere. 3. Dr. G. (III. 28) mentions the occurrence of a bed of coal at Frederick's Brook, a branch of Weldon's Creek, which flows into the Petitcodiac river, in the Parish of Hillsboro'. It exists, he says, ""in several separate strata, the largest of which is about nine feet in thickness."" The quality of this coal is stated to be superior to that of the Memramcook or Stephen's farm, mentioned above; a quantity of it was collected and fired in the bed of the stream, it ignited readily and burned with great splendour; the strata consisted of sandstone, slate, bituminous shale and coal which ran E. and W. with a southerly dip. I visited this place in October last, and found on Mr. Steeve's land, near the bend of Frederick's Brook, a good deal of brownish bituminous shale, but no coal whatever. Subsequent to the period of Dr. Gesner's Report, a boring had been made for coal by Messrs. Bryant and Sherer; we saw some of their old works near the edge of the brook where they had bored to a depth of 40 feet, but without finding any coal. Mr. Steeves showed me what had been regarded as coal, but it proved to be Mineral Pitch or hard bitumen; it had only been found, he said, in small rolled fragments in the surface drift of his fields. The occurrence of this mineral in New Brunswick is interesting, but it was impossible for me in a hurried visit to attempt to discover its proper site. 4. Coal occurs on Mr. Richardson's land, at Cape Enrage, in Chignecto Bay; you yourself visited it in October last, and informed me that it was of the common kind, about eight inches thick, and occurring with the usual shales and sandstones, which dip at a very high angle; that the coal section was very good, and that if other beds had existed, besides the above, they would have been readily seen. (II.23) 5. At Salmon River, further west, and on land belonging to Mr. Foster, coal was spoken of also, but it was said to be impure and of small extent. 6. On the south side of Grindstone Island, Dr. G. reports 9 ""several seams of soft red shale with narrow seams of coal."" The course of the strata is W., and the dip S 40ø; although there are indications of coal at several localities, no out-cropping of any practical value was discovered on the shore. (-- 25.) Westmorland. -1. On Taylor's farm on the west side of the MemramcookRiver, four miles above Dorchester, there is a good natural section of the coal measures; the dip is S.S.E. and nearly 40ø. Here occurs a bed of highly bituminous shale 4 1/2 feet thick, into which an adit has has been made by Mr. Steadman; it ran in, on the dip, for forty or fifty feet, and if followed much farther in the same direction would issue below high water mark; about 200 tons of the mineral were piled on the bank for shipment. It is easily set fire to and blazes readily, but leaves an ash nearly as bulky as the original piece. Scotch cannel leaves about 4 per cent. of ashes. N.B. Courier - Apr. 10, 1858 We understand that a coal mine has been discovered in York County, between Poquiock Settlement and Lake George, on land belonging to Charles MacPherson, Esq., M.P.P. It promises to be a source of great wealth. - St. Croix Herald."

Daily Telegraph - Dec. 14, 1872 and Carleton Sentenil - Dec. 21, 1872 Discovery of Coal at Nashwaak. - A seam of coal is reported to have been found on the farm of Mr. Alex. McLean, Nashwaak, measuring two feet. There are now seven men working at it. Professor Hind, some six or seven years ago, discovered this seam, and obtained some very beautiful specimens of fossils from it, but, at the point where he examined it, it only measured three inches, and by the angle of the rock, which was only 5ø, it was thought impossible for a wide seam of anything like working dimensions to be in the locality. It is feared this may turn out to be only a ""pocket"". There a number of seams in the same neighborhood, probably connected, but all have been thought too small to pay. Several tons of this coal are now ready to be conveyed to

Daily Telegraph - Dec. 16, 1872 The Nashwaak Coal Seam. - The working of coal seam on the farm of Mr. McLean, Nashwaak, has been postponed until spring in consequence of Mr. McLean (refusing to grant) a licence for a longer period. The coal is of a very superior quality and the ferns mostly of the spenopteria tribe, are in great abundance with many very clearly defined specimens. The seam occurs about eighty feet below the surface, under a hill of the same height, the rock dipping about six degrees to the east into it. A boring might probably show as underlying seam of great thickness, in which case it would become a valuable property to the McLean family as they own the land for some miles back."

Moncton Daily Transcript - Dec. 3, 1885 COAL ON THE NASHWAAK - Coal has been discovered on the Nashwaak, about fifteen miles up, on the farm of Mr. John McLean. The seam is a prosperous looking one; so much so that active operations have already commenced. A Mr. Hogan, after examination of the deposit, has purchased an acre of land from Mr. McLean. He is now at work with a large crew of men making excavations. The seam at the surface is ten or twelve inches thick. Mr. Hogan expects to have two feet, at least, of good coal when the mine is properly opened. Further up the Nashwaak, near McBean's Mills, there are also abundant evidence of coal deposits. A boring machine has been ordered and it is expected the country will be thoroughly tested. The quality is similar to the Grand Lake product. - F'ton Capital."

Moncton Daily Transcript - Dec. 14, 1885 and Weekly Transcript - Dec. 16, 1885 COAL AT MARYLAND. - Coal has been discovered at New Maryland on the farm of Mr. Wellington Yerxa about seven miles from the city. Mr. Logan of Gibson, Mr. Turney Manzer and Mr. Hogan visited the farm last week. Mr. Hogan says the coal is of good quality, but the depth of the seam is not known yet. The capacity of the mine will be tested early in the spring.- F'ton Gleaner."

Daily Telegraph - Sep. 12, 1885 Harvey, York Co. - Coal was recently struck in boring for water at John Daley's, Cork Settlement. The seam is reported to be of good workable thickness at a depth of 45 feet from the surface."

Moncton Daily Transcript - May 20, 1886 and Weekly Transcript - May 26, 1886 NASHWAAK COAL. - Mr. Turner Manzer brought downby train to Marysville on Saturday night last a barrel of coal from his mine which he discovered last fall on McBean Brook, near the covered bridge, Nashwaak. The coal is very similar in quality to the Grand Lake coal. The Marysville blacksmith fired his forge with it yesterday and pronounces it excellent burning coal. Mr. Manzer says that since the spring has opened he has made more researches in the vicinity where the coal was first discovered and finds that the mine extends for a considerable distance along the McBean Brook. He has recently obtained a twenty years lease of the mine, and expects to begin operations at once. He went up this morning taking with him Mr. James Henry, an old miner. -

Fredericton Capital - May 22, 1886 New Coal Mine. - Last autumn coal was discovered on the McBean Brook, a tributary of the Nashwaak. Mr. Turney Manzer has obtained a lease of the mining privilege and intends operating it. Samples have been tried, and it has been found fully equal to the Grand Lake Coal which it much resembles. From explorations already made, there appears to be a large coal area in the neighborhood of this find."

S.J. Daily Sun - May 28, 1886 A Coal Mine. - After investigation by a competent miner, Turney Manzer's coal mine on the Nashwaak, promises to become a huge bonanza for him. - Fredericton Reporter"

Fredericton Capital - Oct. 9, 1886 Coal at Manners Sutton. - The well borers at Manners Sutton have again struck coal. This time it is been found in sinking a well for Wm. Messer at Tweedside, so called. The seam is good two feet in thickness, and the quality as far as can be judged, excellent, being very bright in color. There is no doubt a thicker bed of coal at a greater depth. The previous find was at John Daley's, in Cork."

Moncton Daily Transcript - Dec. 2, 1887 George Kingston, of Cork Settlement near Harvey Station, N.B. Ry., has discovered a seam of coal cropping out on the side of his well."

Codes: M6 / IDX_Names: York County Coal;
Fredericton Daily Gleaner - Dec. 11, 1890 and S.J. Globe - Dec. 12, 1890 Struck It Rich. - The people on the Tay and vicinity are quite excited over the rich gold field lately discovered there. Its existence has been known for some time, but it was supposed to be present only in very small quantity. But a vein has been struck on the stream about a mile below the Campbell property, and four miles from the mouth of the Tay on the Nashwaak. At this point there is a ledge rising sixty feet from the water, and in it a vertical seam of good coal has been found two and a half feet wide. It has been tested in some of the blacksmith's shops and pronounced very suitable for their work, and they are now getting in their winter supplies from this lead. - Fredericton Gleaner."

St. Croix Courier - Dec. 18, 1890 An interesting discovery of coal is reported from the Nashwaak. J.A. McCallum of Halifax, mining expert, brought into Fredericton some very fair specimens of surface coal which were obtained in the vicinity of the covered bridge. The vein discovered is said to be two feet wide, and is undoubtedly valuable if properly

Fredericton Daily Gleaner - Dec. 18, 1890 and Daily Times - Dec. 20, 1890 and St. Croix Courier - Dec. 25, 1890 Specimens of coal lately found on the Tay Stream in the Nashwaak have been sent to E.H. Allen, one of the principal coal merchants in Fredericton, and he pronounces it good. He is to receive a barrel of it in a short time. There is every reason to believe that a good seam has been discovered, and all now needed is a company to undertake the work. The bed is located about two miles from the Canada Eastern railway, and about twelve miles from Gibson Station opposite

Chignecto Post - Dec. 18, 1890 and Weekly Record - Fri. Dec. 19, 1890 A seam of coal two and a half feet wide has been discovered on the Nashwaak River, not far from Fredericton. This is regarded as the most important coal find ever made in central New Brunswick. The people on the Tay and vicinity are much excited over the rich coal field lately discovered there. Its existence has been known for some time, but it was supposed to be present only in very small quantities. But a vein has been struck on the stream about a mile below the Campbell property, and four miles from the mouth of the Tay on the Nashwaak. At this point there is a ledge rising 60 feet from the water, and in it a vertical seam of good coal has been found, two and a half feet wide. It has been tested in some of the blacksmith's shops and pronounced suitable for their work, and they are now getting their winter supplies from this lead.- Fredericton Gleaner."

Chignecto Post - Jan. 1, 1891 Mr. McAllum, the mining expert of Nova Scotia, has met with considerable success in York County. His explorations for only a few days, on the Nashwaak, revealed to the residents that they have a rich bed of coal in that vicinity, and the hotel where he now stays, the Queen, has received a token of his achievements in the shape of a barrel of what now goes by the name of Nashwaak Coal.- F'ton Globe."

Fredericton Daily Gleaner - Nov. 20, 1891 Mr. Glendenning's Mine At Cork. - Postmaster Glendenning, of Harvey, has had a crew of men at work at his coal mine, near Cork Station, in Manners Sutton parish, for some time past. Mr. Glendenning is daily increasing his confidence in the value of his mine. He believes that it contains an almost unlimited quantity of coal, and of a superior quality. It is to be hoped that Mr. Glendenning's speculations are right, for with the mine located so close to the line of the C.P.R. it could then be made a very profitable investment."

Fredericton Gleaner - Oct. 2, 1891 and Evening Gazette - Oct. 5, 1891Coal mining is beginning to loom up again at Manners Sutton. There is a very good quality of coal to be found there, but it has never been ascertained as to whether it exists in any large quantity. A vein of twenty-two inches was struck at Cork but nothing further was done. For years an old blacksmith got enough coal to run his forge at a place known as Rear settlement. It was a surface outcrop and a pickaxe and sledge were all the tools he used. A license covering the ground has now been secured and a successful find may be reported in a few days. - Fredericton Gleaner."

Daily Times - Oct. 7, 1891 Coal Mining. - Fredericton Gleaner: Coal mining is beginning to loom up again at Manners Sutton. There is a very good quality of coal to be found there, but it has never been ascertained as to whether it exists in any large quantity. A vein of twenty two inches was struck at Cork but nothing further was done. For years an old blacksmith got enough coal to run his forge at a place known as the Rear settlement. It was a surface out crop and a pickaxe and sledge were all the tools he used. A licence covering the ground has now been secured and a successful find may be

Fredericton Daily Gleaner - Oct. 9, 1891 Coal Mining. - D. Glendenning, merchant, of Harvey Station was in town yesterday attending the exhibition. Being asked about the coal mine at Cork for which he has taken out a license, he says that although little prospecting has been done, yet there is every indication that a good bed of coal exists quite near the surface. He intends to begin work at once and should his expectations be realized other licenses will be got as coal has been found in several other places and of the best quality. The finds are all in the immediate neighborhood of the C.P.R. track, and on the face of a hill so that mining can be carried on to good advantage. It is to be hoped that his expectation may be realized as coal so near this city would be a boom to all especially to manufacturers."

Evening Gazette - Oct. 21, 1891 Fredericton. - David Glendenning of Harvey, is making preparations for coal mining on his mining license at Cork."

Codes: M6 / IDX_Names: York County Coal;

St. Croix Courier - Oct. 29, 1891 Mr. Glendenning of Harvey Station is making all preparations for coal mining and some work will be done before the snow prevents operations. As soon as spring permits, however, the work will be pushed and it is altogether probable that an active industry will spring up as there is an abundance of coal if indications mean anything."

S.J. Globe - Apr. 25, 1892 Coal Mining. - Operations to Begin About The First Of June. - (Fredericton Herald). - Although the prospects for coal at Cork Station and Tracey have been kept very secret, yet enough has leaked out to satisfy those interested that there is coal at these places, and that of the best quality. It will be remembered that samples were sent to Boston in the fall, and it appears that these were highly satisfactory to mining experts in that city. A New York company, it is now rumored, are to begin operations at Cork Station on Patrick Maloney's farm about the first of June. The work will be prosecuted under the supervision of D. Glendenning. The Hilyard mine at Tracey is also to be operated about the same time. It is not known what company will have control. In several places coal shale has been struck, very similar to the shale found in Albert county, overlaying the famous Albertite. It is highly probable that there will be quite a rush in prospecting in this locality, as coal has cropped out in many places."

Daily Times - Jul. 24, 1894York Co. Coal Mine. - A Strong Company Being Formed to Carry on Operations. - Fredericton, July 23. - The Gleaner tonight contains a long article upon the new coal mine which has been discovered at Fredericton Junction, for the development of which a strong company is being formed. The mine is about four miles from the Junction depot and near the Oromocto River. The company has secured ten miles of territory. The seam now being tested is about twenty inches thick and broadening as it goes down. The coal is said to be of excellent quality. Edward Moore of this city and A.H. Bell of St. John are actively interested in the formation of the company. A borer will be procured and a thorough test of the mine made. If satisfactory a railway will be built to the mine and connection opened up with river steamers at Oromocto which will ensure very cheap shipment and enable the company to lay their coal for a low price at all parts of the

Woodstock Dispatch - Jul. 25, 1894 Coal Mining. - If matters pan out as the promoters hope, there will be a boom in the vicinity of Fredericton Junction. Mr. A.H. Bell, who has associated with him Mr. Edward Moore, has secured from the government five miles of land, and the papers are now being made out for five miles more, for coal mining operations. The land is situated about four miles from Fredericton Junction and one and a half miles from the Oromocto River. On this land a 17-inch seam of coal has been discovered. The seam runs with a dip on an angle and it is expected the further down it goes the thicker the vein is. So far as the prospectors have gone the indications point that way. Next week specimens of the coal will be brought to St. John and a company will be formed to operate the mine. - Globe"

Campbellton Graphic. - May 18, 1909 Coal In York Co. - Coun. C.N. Goodspeed of Penniac was in the city yesterday showing samples of what is believed to be anthracite coal which he lately found on his farm. He ploughed the coal up in a field a considerable distance from the house, and was naturally very much astonished over his discovery. So far as he is aware nobody in that neighborhood ever used hard coal and therefore he does not think it possible that the samples he found could have been carried there from outside. He says that he turned up a large quantity of it with the plow and he has every reason to believe that he has stumbled on a mine of this valuable fuel. - Herald."

S.J. Globe - Feb. 29, 1892 Oromocto Coal Mining Company. - We have received a copy of the following circular: In the counties of Sunbury and York, province of New Brunswick, there have recently been discovered numerous outcroppings of bituminous coal, indicating the existence of large bodies of this mineral. In a vertical cliff on the N.W. Oromocto river, the coal boldly outcrops in a seam varying in thickness from 20 inches to two feet, the quality for surface coal being excellent and giving promise of showing a body of rich coal of the cannel nature, on the seam being opened up. Leases and rights of search over a tract comprising six square miles have been secured from the government of New Brunswick. Leases are granted for twenty years and are renewable to 80 years. As soon as operations can be begun (about April) the services of a mining expert will be engaged, and a diamond drill secured, so that the six square mile tract may be thoroughly and expeditiously proved, thus determining the extent of the coal field in the shortest possible time. The Canadian Pacific Railway runs through the property within three-fourths of a mile from the cliff in which the coal outcrops, affording shipping facilities by rail to all Canadian and New England points. The city of St. John is some 60 miles distant by rail, from which port vessels of the largest class can load at all seasons of the year. The distance by water from St. John to New England ports is short and vessels can be obtained at lowest rates of freight. To a point on the St. John river some 20 miles distant, a railroad can be built, and at this place large vessels will be able to load, thus enabling shipments to be made by water during eight months of the year, with only a haulage by rail of 20 miles. It is expected that contracts can be made with Canadian Pacific Railway for a large quantity of the output. Application for an act to incorporate a company will be made at the ensuing session of the New Brunswick legislature. It is proposed to place the capital stock at $500,000, with power to increase to $1,000,000. Of the capital stock $200,000 will be placed in the treasury, to be sold to equip the mine and for other purposes in the interest of the company. Prof. Wm. F. Roberts, of Pennsylvania, a well known mining expert and geologist, who has beenconducting operations on the property of the Musquash Anthracite Coal Mining Company, at Musquash, New Brunswick, asserts that the province is rich in coal and other minerals. The indications at Oromocto point to this coal field as being a very valuable one. Further particulars can be obtained, and samples of the coal already taken out seen, by applying to Arthur H. Hilyard, George S. Robertson, Crawford House, Boston, Mass. Boston, Mass., Feb. 18, 1892."

S.J. Daily News - Apr. 6?, 1876 The Mining Committee's Report. - Mr. Butler, from the Committee appointed on the 18th day of February last, to whom was referred all matters connected with the mining interests of this Province, submitted their report, which was read as followeth: Committee Room, 4th April, 1876. The Committee to whom was referred all matters relating to the mining interests of this Province, beg leave to report - That from a very lengthy and valuable paper prepared by Dr. Bailey of the University, and submitted to them, it appears that the Provincial diamond drill, having failed to reach any considerable depth at Clones, in Queen's County, was located at Three Tree Creek, in the County of Sunbury, in April last, and commenced operations on the fourteenth of that month, and continued to operate there until the early part of November last. A depth of 616 feet was reached, being the greatest depth yet obtained by drill; and while your committee regret that no coal or other mineral was found, it is satisfactory to be able to state that the search was exhaustive, and sets at rest the question of the existence of coal at that point. Dr. Bailey very kindly came before the Committee and gave them the benefit of his knowledge in reference to the Geological indications in that part of the country. He expresses the opinion that any other borings in that section of the country should be made in an easterly direction, and that two holes bored at about equal distances between Three Tree Creek and Gagetown, would set at rest the question of the existence of coal in that region. Your Committee believe that the work performed by the diamond drill during the last season, was, under all circumstances, more satisfactory than in any previous year. It is still at Three Tree Creek, but has not been operated since November. The Hon. Francis Hibbard and Mr. John Steadman appeared before your Committee, and expressed their wish that the Mining Regulations should be so amended as to exempt gold and silver from Royalty for ten years from the date of the License; and that the five per cent Royalty upon these and other minerals, when paid, should be upon the profits of the mine instead of upon the value of the minerals raised. Mr. F. Woods also came before your Committee and urged the desirability of making another trial with the Diamond Drill in the vicinity of Victoria Settlement, Queen's County, and expressed the opinion that the boring in the neighboring locality of Clones' was by no means conclusive. Mr. John Phillips also appeared before your Committee and stated that coal had been frequently found on the Restigouche River, between Dalhousie and Campbellton, and expressed the opinion that the drill should be sent there. Your Committee, in conclusion, must express their regret, that in consequence of the want of success hitherto in the discovery of mines and minerals, their report is necessarily meagre and unimportant. Respectfully submitted, Walter S. Butler, John S. Covert, James McKay, James Ryan, John A. Humphrey."

Kings County Record - Sep. 13, 1945 Geologists Make Surveys In Kings County In 1944. - From the annual report of the department of Lands and Mines of the province of New Brunswick, the report given by Dr. W.J. Wright, provincial geologist, shows that during last year considerable survey work was carried on in Kings County. One party of men under the direction of J.McNeil, made surveys of the salt-bearing areas at Mannhurst, Cornhill and Plumwesweep. Exploration for coal deposits was carried on atDunsinane, where five holes were drilled at intervals within an area of about one square mile, to depths of 181 to 432 feet. Four holes cut coal. There are two groups of seams separated by 10 to 12 feet of shale. The top group varies in thickness from 20 to 32 inches and the bottom seam 24 to 41 inches. Owing to the poor recovery of the coal core it is difficult to determine the actual character of the groups but the conclusion is that they comprise at least two seams of coal separated by shale. The outcrop of one seam in the 'Smith Pit' shows the following in descending order:- Coal, 7.5', shale 6', coal 8'. It is not known whether this is the top or bottom group. The salt bearing areas of the Cornhill-Mannhurst basins were surveyed and plans are being completed to show the property lines, general geology and locations of salt seepages, drill holes. etc. Samples of brine were collected from Mannhurst, Cornhill, Penobsquis and Plumwesweep. They were analyzed qualitatively in the provincial laboratory by E. Rowley. All samples contain sodium, calcium, and magnesium, and those from Mannhurst, Penobsquis, and Plumwesweep contain potassium. Quantitative analysis was not undertaken because the samples were diluted by varying amounts of rain water."

Kings County Record - Sep. 29, 1949 Shell Plans Use Of Heavier Drill. - Shell Exploration New Brunswick Limited is bringing in heavy drilling equipment to continue its search for oil in New Brunswick, it was announced yesterday from the company's headquarters in Moncton. The heavy drill, capable of probing the earth to a depth of 12,000 feet, will be used first near Dorchester, where a test well already has been put down to 5,668 feet. Shell Exploration New Brunswick Limited, which established its head office in Sussex for its first operations, sank two test wells in Kings county before moving to Westmorland county during the spring of 1949. The Kings county wells were at Urney and Apohaqui. The company still maintains Sussex as a supply base. The announcement of future plans said: 'In addition to deepening the Dorchester well

with heavy deep well drilling equipment, Shell is commencing drilling shallower tests with the present light equipment. These well will probably be drilled to depths up to 6,000 feet. 'The test well located near Dorchester reached adepth of 5,668 feet at the end of two months' drilling. The top of the main objective of this test, the Albert formation, was reached shortly before this depth was attained, and during the course of drilling a deposit of salt was discovered which is more than 3,000 feet in thickness. The average drilling speed to date has been in excess of 90 feet per day. 'At present, drilling operations are suspended as the equipment on hand has reached its mechanical depth limit, but heavier equipment will be arriving during the coming week to deepen the well. This consists of one of the heaviest types manufactured and will be capable of deepening the well to 12,000 feet should this be necessary. It is equipped with a derrick 150 feet in height with a load capacity of 350 tons. 'The next test will commence drilling this week and is located at Belliveau Village, about five miles northwest of the Dorchester test well. The location has been prepared and drilling equipment is being assembled on the site. 'During the summer, seismic exploration work has been carried out in eastern Westmorland county and during the months of June, July and August a total of 419 shot holes were drilled with a total footage of more than 36,000 feet. In addition to this, a gravity survey has been run over areas of Westmorland County to give additional information for the possible location of test drilling. 'By agreement with New Brunswick Oilfields Limited, an extensive exploration program is being carried out in Hillsborough parish utilizing both seismic and gravity survey parties in addition to a surface geological survey. It is hoped the results of these surveys will be completed late this fall.'"

N.B. Courier - Sep. 23, 1837 LETTER II. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May it please your excellency; Having in a former letter, and as briefly as possible, endeavored to give an account of the rocks of the Coal Measures on the west side of Chignecto Bay, and to notice some of their most important characters, I now proceed to the examination of the deposits in the direction of the main road leading from Cumberland to Saint John. There is an inconsiderable ridge of grey sandstone extending from Fort Cumberland in a northeast direction. Along the lower grounds at the base of this eminence it was proposed to open a canal, to communicate with the Bay De Verte; and certainly the situation is most favorable for that object, for advantage may perhaps be derived from a considerable lake, and as the country is low and level, there would be but few difficulties to encounter. Leaving the boundary line between Nova Scotia and New Brunswick southward, the road passes four miles over the great Tantamarre Marsh, one of the greatest collections of marine alluvium in North America. This alluvial deposit extends from several small lakes,situated some distance in the interior of the country, to the head of Cumberland Basin. It is fourteen miles long, and averages about four miles in breadth. Through it the Tantamarre winds its way to the sea, sweeping forward both on the ebb and flood tide the talus which can no longer find a resting place on the banks of a river brought to its narrowest limits by the constant accumulation thus conveyed. Already surcharged with disintegrated sandstone, the river in times of freshet, sends back to the sea the surplus sediment which is fast accumulating at its mouth, and will in time convert Cumberland Basin itself into an extensive marsh. Had the coasts of Chignecto Bay been formed of granite or any other crystalline rock, the present site of the great marsh of Sackville would have remained unobstructed, and now cease to extend its boundaries; but the yielding sandstone giving away before the action of the elements, has not only furnished the materials of the deposit already made, but continues its steady supplies for situations still remaining open, and ready to devour each particle of siliceous and argillaceous matter as it is carried along by the influx of the sea. Large rafts of timber have been buried in these marshes, trunks and branches of trees were often observed projecting from the bank at the bottom of the river - they have been discovered twenty feet below the surface - even the bones of wild animals have met this kind or interment, and large masses of rock having been transported by the ice, have fallen into the same common grave. All these, and perchance the works of art that may have been lodged in this wide receptacle, may a thousand years hence afford matter for grave speculation to those who will not consider the changes constantly going forward upon the earth. Great numbers of white wild geese formerly frequented these places, but they have long since disappeared, and but few of the grey variety now make them a resting place in the Spring. The alluvial deposits in this part of the country are extremely valuable. The inhabitants throw up dykes and embankments against the sea, and thus convert the soil formerly submersed by every high tide, into rich meadows; notwithstanding large tracts are in a sunken and neglected condition for the want of proper draining. The tide in Cumberland Basin rises about sixty feet at spring tides, therefore it is practicable to drain even the lowest lots, and the tide can be shut out by proper floodgates. The soil in the Parish of Sackville rests generally on new red sandstone. This rock reposes on the sandstone of the coal measures, and affords plentiful supplies to its numerous inhabitants. Westcok, the residence of Judge Botsford, has the appearance of an English manor. It overlooks the great marsh, and head of Cumberland Basin, and the beautiful villages scattered along the banks of its rivers. From the beds of clay interspersed near the surface, the country is well watered. There are also collections of sand and gravel. - The farms are small, and not remarkable for neatness, notwithstanding when viewed at a distance, and with the gentle eminences over which they are spread, they form a most pleasing landscape, and the small clusters of trees still remaining - affording shelter and shade to cattle and sheep - are instances of considerable foresight and taste. From Sackville to Dorchester, a distance of nine miles, the road passes over more elevated land; the grey sandstone of the coal measures often containing the impressions of leaves, and other vegetable remains, is predominant; and breaking out beneath the Court House of the latter village, forms a considerable declivity. At some places the rock is covered with a soft conglomerate and red sand, which afford a less fertile soil than the red marly rock of the lower lands. Dorchester and its river were formerly called Memramcook. The principal village stands on a slope, where several grist and saw mills are propelled by the brook descending towards the river. Looking southward, Shepody Mountains appear lifting their tops far above the rocks of the carboniferous order. Judging from their appearance at a distance they are composed of primary and transition formations; and probably like the Cobequid chain in Nova Scotia, (of which they may be said to form a part), they are the southern boundary of the vast coal district of the Province. The Memramcook river extends in a north direction until its ultimate branches meet those of the Shediac on the Straits of Northumberland. The marsh along its banks is twelve miles long, and embraces four thousand acres. The alluvium here is like that of the Tantamarre, having been derived from the same sources, and collected by the same causes. The upland farm lots all join the marsh, and are well cultivated, forming a broad band down each side of the river. From many points the view is delightful, and characteristic of the Acadian inhabitants, who still retain the French language, habits and costume. Four miles northward of the Court House, there is a bed of limestone interstratified with the sandstone. It would be an excellent auxilliary as a manure, were it applied, and is admirably adapted to the soil of the country, where it has been deposited. Having carefully examined the alluvium of the marshes already mentioned, they were found to contain a much greater quantity of silicious, and less argillaceous matter than those of Hants and King's Counties, in Nova Scotia. These circumstances are readily explained, when it is considered that the marshes of Westmorland are composed of pulverised grey sandstone, while those of the most fertile of the other province consist of disintegrated new red sandstone, which from its containing a greater quantity of marl produces more luxuriant crops. The deficiency of calcareous matter in the extensive marshes of Tantamarre and Memramcook, might however be readily supplied by the application of lime. There are numerous blocks of granite scattered on the surface of this country; from whence they came it is difficult to determine, when so little is known of the geology of the Province. It is most probable nevertheless that they have been exiled from the primary rocks forming the Shepody Mountains, by the force of water which has evidently submerged the country at some remote period in the earth's history. From the bridge over the Memramcook to the Petitcodiac, a distance of ten miles, the sandstones of the coal measures rise to the surface. Here, as in many other situations, the frost, rain, and vicissitudes of the weather, have produced a dilapidation of their strata, and a light sandy soil is mixed with the detritus formed under the more active operations of causes which have long since subsided. The soil thus formed, principally of silicious matter, is by no means productive, and instead of the sugar maple, beech, and yellow birch, the meagre white maple and spruce have here fixed their residence. A number of French families reside on the road, and as is usual with them their farms are small, and their dwellings humble. Arriving at the Petitcodiac river from the eastward, a tolerable high ridge of land will be seen to the northward, and a chain of mountains extending from Shepody appear stretching away to the southward and westward; detached boulders of granite increase in number on approaching this large stream, and collections of fine yellow sand; and beds of clay, may be seen by the road side. This beautiful river, following a serpentine course in a north east direction, turns at almost a right angle at a place called the 'Bend of Petitcodiac', from thence it extends southwest until its branches meet the forked extremities of the Kennebecasis. At the angle thus formed, there is a considerable village, with an excellent landing place for timber, deals, and other productions of the fertile and well populated country in the neighborhood. At high water the scenery is very pleasing, and bears a resemblance to some of the splendid views on the Thames and Mersey, in England; but at low water its imposing effect is lost, and the empty chasm, with its muddy banks, have a disagreeable and gloomy aspect. In this river the tide runs with great rapidity, often opening new channels and sweeping away large collections of sand, and undermining the alluvium produced by its singular powers. So great is the distance over which it must pass in the space of a few hours, that its increasing volume on the flood, particularly at Spring tides, is greater than its speed over the gently inclined 'flats', hence it rolls forward in a foaming tidal wave, sometimes six feet high, sweeping the river with a rush of water like that of a coming deluge. - The effects of such powerful causes appear obvious, in the estuaries of Shepody Bay and Cumberland Basin, where the increasing collection of sand and shingle are undergoing pulverisation to fill more quiet situations with the sinking sediment. Large trees, pieces of timber, and quantities of vegetable matter, drifted from the marshes above, lie buried in these moving sands; wrecked vessels and boats also add to the materials covered in these fearful wastes, over which at high water the largest ships may pass in safety. I have not had the opportunity of measuring accurately the height of the tides in the Petitcodiac, but am of the opinion its highest limits will exceed seventy five feet. Large quantities of marsh on the river have been rescued by dyking, and now yield a plentiful supply of fodder for cattle. The new red sandstone at Sackville, extends in a southwest direction to the ""Bend"", where it is occupied by a number of farms, sloping down the higher grounds on the borders of the marshes to which they are attached. From the Bend of Petitcodiac to Nixon's Inn, a distance of 12 miles, the road extends along the north side of the river. The soil became sandy and light; instead of birch, beech and maple; larch, white and yellow pine inhabit the surface. I have observed that the pine always selects a loose sandy soil, which not only affords it a larger growth, but allows its roots to extend to great distances, thereby affording greater security in gales of wind. The more hardy spruce will 5 send its roots in the narrow crevices of rocks, and cling to a footing where other plants would fall before the breeze. The sand along this road lies directly on the rocks of the coal measures, and often forms collections of considerable depth. On a branch of the Petitcodiac called PollettRiver, and about six miles form the main road, there isan outcropping of coal, which has been intersected by theravine giving passage to that stream. The coal has beenemployed by a blacksmith in that neighborhood, and I regret that I was unable to devote sufficient time, and expense, to ascertain the probable quantity there deposited. I observed a quantity of the argillaceous oxide of iron (clay iron stone) not far from the coal, and it is probable that there is a sufficient quantity of those valuable minerals in the vicinity of this river, at least to support an iron foundry. But considerable time and labour would be required for their full discovery and development. The subsoil in this part of Westmorland is light and sandy, having been derived from the sandstone placed beneath. Blocks of granite, syenite, and porphyry, are common on the surface, and seem to increase in Frequency as the road diverges towards the mountainous land situated a few miles from the coast of the Bay of Fundy. Among the pines I observed a number of red bellied woodpeckers, the Picus Carolinus, a rare bird in Nova Scotia. They are covered with a beautiful plummage, but are very destructive to the groves of pine, as this kind of wood offers but a feeble resistance to the horny beaks of these industrious animals. Between Nixon's and Holstead's Inns, there are some good farms, and instead of the marshes formed by the influx of the sea, The Peticodiac passes through a band of intervale formed in the course of past ages by loose soil, and decayed vegetables, swept down by torrents of rain descending from the neighboring hills. Pursuing its course in a westerly direction, the new red sandstone, four miles northwards of Holstead's Inn, forms a long belt of rising ground called ""Butternut Ridge"", on which there are several new and flourishing settlements. The red marly rock at this place contains beds of limestone, gypsum and rock salt. Several springs take their rise, and send forth large quantities of water highly impregnated with the saliferous mineral. The importance of these deposits to agriculture should not be overlooked, and the design of the Creator of the Universe in supplying salt far from the briny waters of the ocean, and granting lime to enrich the soil are among the exalted acts of his allwise Providence. The limestone contains the remains of numerous shells belonging to the sea. These point out the relative age of the rock, and the peculiar circumstances of its original history. Most of the species of these moluscous animals are now extinct, and their nearest types are only found in 6

Codes: O7 / X1 / E2 / IDX_Names: Salt/Potash - Sussex Area; Grand Lake Coal; Oil and Gas - Kings Co.;

Richibucto Review - Sep. 5, 1901 The mining outlook seems particularly bright in New Brunswick, and we trust the experimental work being conducted in the various counties will demonstrate the expected quantities of mineral wealth. In this county the reports of the coal finds in the upper part of the county have raised great hopes of a profitable industry. In Westmorland the boring for oil is going on and in addition to striking a steady flow of good quality oil in the first well, the operations at the second well havedisclosed the first level of oil sands at 100 feet depth giving a strong flow of gas. In Kings County the boring for saline springs, and in Queens and Sunbury the prospecting for surface coal have been

S.J. Morning Freeman - Nov. 13, 1860 It is said that an oil well of great value was discovered some time ago on the banks of the Memramcook."

Chignecto Post - Nov. 27, 1879 and Moncton Daily Times - Nov. 28, 1879 and S.J. Daily Telegraph - Nov. 29, 1979 Memramcook.- The Oil Company, working in the rear of the College, are now drilling. They have reached the depth of between thirty and forty feet. It is expected that they will strike oil, if not where they are working, at least somewhere in

Weekly Freeman - Apr. 17, 1880 Oil Boring. - The Company of Americans who are boring for oil at Fox Creek and Memramcook, last summer, are expecting to recommence operations at the latter place by the first of June."

Chignecto Post - Apr. 29, 1880 Prospecting for oil at Beliveau.- The U.S.Company that own a leases of land in the vicinity of Beliveau and that were engaged in boring last season, are so much encouraged by the indications, they have determined to recommence this season on a larger scale boring for oil."

Moncton Daily Times - Nov. 2, 1882 Boring for Oil. - The parties who are boring for oil at Memramcook are again making good progress. They have succeeded in getting out the head of the drill, which was broken some time ago, and were to have commenced boring again on Monday."

S.J. Globe - Nov. 17, 1882 and S.J. Daily Sun - Nov. 17, 1882 and Moncton Daily Times - Nov. 18, 1882 and Daily

Telegraph - Nov. 17, 1882 Rufus S. Merrill, Joshua Merrill, J. Porter Waitt, S. Payson Bradley, Edward E. Allen, Henry Robbins, Frederic Robbins, H.A. Morse, all of Boston; Chas. Newell, of Newtonville, Mass.; John A. Fish, of St. John; Freeman W. Wisdom, of St. John; John B. Elliot, of Moncton; and H.A. Whitney, of Moncton, have filed in the office of the Provincial Secretary a memorandum of association for the incorporation of the The St. Joseph Petroleum Company of New Brunswick, for the purpose of buying, leasing and selling of oil and mineral lands: the producing, selling, and transporting of petroleum, oilsand minerals; and the manufacturing of petroleum, oils and minerals; capital $100,000, to be divided into 4,000 shares of $25 each; the office of the company to be at Dorchester."

Moncton Daily Times - Nov. 22, 1882 Rebuilding. - The Oil Company at Memramcook are re-building the erections destroyed by fire and replacing machinery."

Moncton Daily Times - Nov. 22, 1882 Memramcook Oil. - The managers of the oil well have ordered the lumber for the construction of a new derrick to replace the one lately burnt. They will, if possible, continue boring this winter."

Weekly Transcript - Nov. 27, 1882 Boring for Oil. - Mr. John A. Fish, of St. John,in a conversation with our reporter yesterday, stated that the derrick recently burned down in Memramcook is being rebuilt and the other machinery destroyed, replaced. Already they have reached a depth of 1,200 feet, but as yet, to use his own words, They have not

Moncton Daily Times - Jul. 9, 1886 Dover. - A company of Americans are boring for oil between this place and Memramcook. They have six or seven men employed. - Post"

S.J. Daily Sun - May 18, 1900 A company of American capitalists are making preparations for boring for oil on the college grounds. A large derrick, 75 feet in height, has been raised and the engine and boiler are now being placed in position. From the nature of the ground and from oil wells which have previously been sunk in the immediate vicinity, it is thought that the undertaking will be successful."

St. John Star - Aug. 24, 1901 At a depth of about 100 feet in the second well at St. Joseph's, oil sands were struck yesterday, and a great flow of gas followed. This is regarded as a very favorable indication. Matthew Lodge says his company will at once torpedo the well with nitro-glycerine."

Weekly Record - Fri., Aug. 30, 1901 Oil has been struck in a second well being bored at Memramcook. The manager says that the company will immediately torpedo this well with nitro-glycerin, which will be made at St. Joseph's by a man from Acadia Powder Company's Works, Halifax. They will then connect the new well with the present pumping well by means of jerker rods and the two wells will be pumped by the same power. The boring of new wells will also be commenced at once and for that purpose two more working rigs have been ordered. It is hoped to have at least a score of wells in operation in the vicinity of the present two within the next several weeks. The directors of the company are more than satisfied with the commercial value of their property, but no stock will be offered the public until its value has been demonstrated beyond all

Codes: P1 / IDX_Names: St. Joseph Oil;
St. John Star - Aug. 31, 1901 The Oil Wells. - M. Lodge, who was in the city yesterday, states that prospecting for oil at St. Joseph had passed the experimental stage, and it was now evident that oil is to be found in New Brunswick and can be got in paying quantities. The first well is now producing eight barrels per day and the one struck this week is still more promising. Oil was discovered at a depth of 180 feet and wells will now be sunk to depth of 1500 feet."

Weekly Record - Fri., Jul. 26, 1901 The latest reports from the Memramcook oil wells go to show that the capacity of the well from which the oil is flowing has increased to 10 bbls per day. This is certainly satisfactory and will undoubtedly lead to a still greater development of the explorations in the province. Samples of the oil submitted to the best analytical tests indicate it to be one of the finest grades of petroleum in the U.S. or Canada."

Weekly Record - Fri., Jun. 28, 1901 The oil boring continues briskly at St. Joseph's, Westmorland Co. On Monday a night shift was put on, and the yielding well is now bored to 285 feet. The flow of oil has materially increased since last week, and the daily incidental yield without any pump is about five barrels. The quantity also continues unimpaired with an apparent improvement in quality than that first yielded."

N.B. Reporter - Mar. 6, 1901 The New Brunswick Oil Co. is now boring for oil near St. Joseph's College, Memramcook."

Weekly Record - Fri., Oct. 18, 1901 New Brunswick Oil All Right. - Hon. H.R. Emmerson has been visiting the oil regions of Pennsylvania, where he has had a chance to compare conditions of the oil industry and the quality of the oil found there, with that found at Memramcook in this province. Writing home to friends he says: 'Let me say to you that after a careful inspection of the oil wells here and hereabouts, and of the production thereof, I am more than ever convinced as to the value of our New Brunswick proposition. The average production of these wells and in surrounding districts is but one half barrel per day, and they pay well with oil selling at only $1.30 per barrel. Our New Brunswick oil is much superior to this and equal to the quality of an oil from a county near here which sells at $4.50 to $6.50 per barrel. A well that will produce - pump - one barrel per day is considered a gem here. They have no gushers in these days. A five and ten-barrel a day well is looked upon as a fortune getter; but the quality of the wells - oh my! You can count them by the tens of thousands, 'really and trully' in this and adjoining districts. In this city, containing about 18,000 to 20,000 inhabitants, the oil well derricks are to be counted by the score; yes, hundreds, in people's back yards, and in several instances which I noticed, even in their front lawns. Fancy an oil well where our flag staff is at home in Dorchester, and yet I have seen similar conditions here. I am simply amazed at the extent of the business. Everybody here has money. It is a very rich city and all the result of oil. I am preparing to go home determined to put down wells, as fast as possible. We are too slow; we must move on, and in a hurry! I have visited the refineries and they are within our means and reach.'"

N.B. Reporter - Jul. 9, 1902 Another oil well was torpedoed at St. Joseph's last week, and three are now producing oil. Other wells will be torpedoed as soon as possible. Tanks are being constructed and there is now talk of refineries."

S.J. Star - Jul. 10, 1902 Another well was torpedoed at St. Joseph's last evening. It is expected the results will be satisfactory. The Albert county wells will be shot next week."

N.B. Reporter - Jun. 25, 1902 The New Brunswick Petroleum Company commenced torpedoing their wells at St. Joseph's College, Thursday. A well 800 feet deep was nitro-glycerined but so far no results are visible. Boring still continues at Hillsboro, one well being 1,400 feet deep. Oil sands are being struck in two or three places."

N.B. Reporter - Jun. 25, 1902 The first oil well at Memramcook was shot on Friday afternoon. The oil in the well was 150 ft. deep, and will yield from 20 to 50 barrels per day."

Codes: P1 / IDX_Names: St. Joseph Oil;

Weekly Record - Fri., Jun. 27, 1902 Have Struck Oil. - Well at St. Joseph's, Westmorland Co., will Yield Twenty-Five to Fifty Barrels per Day. - Saturday last at St. Joseph's oil district the New Brunswick Petroleum Company shot their first oil well and the results exceeded the most sanguine expectations. M.S. Shaw, an expert from Ontario, has had charge of this work. The first well had been shot the day previous but was merely a test to prove the strength of the product, and was made in an oil well where the oil sands had not been reached. The shot was exploded in the oil shales to determine a question as to whether the shales to be found in this and Albert counties in abundance, fully impregnated with oil, would flow on explosion as do the oil sands. The prevailing opinion was that they would not as the result proved. Friday evening Mr. Shaw took about 40 quarts which is considered a small shot of the nitro- glycerine to well No. 7, on the Gaudet farm, northwest of St. Joseph's College. The charge was exploded in the oil sands or rock at a depth of 411 feet from the surface. A column of oil and water (the latter having been placed in the well for tamping purposes) was thrown in the air, upwards of 100 feet above the top of the derrick. A great volume of crude petroleum together with pieces of the oil rock, was sent forth. The whole formed a magnificent spectacle and was witnessed by a large crowd. An amateur photographer was so amazed by the explosion, quickly followed by the flying column, that he forgot to press the button until it was too late for a picture. After the shot, numbers rushed to the hole where rumbling of the gas and the flow of oil in the well were distinctly heard. J.H. Gayton, an oil expert from Pennsylvania, visited the well and took steps to determine its capacity. The well is totally free from water and there was found to be 150 feet of oil in actual depth from the bottom, showing it to be a richly yielding well. Mr. Gayton on the evening of the explosion said that if it were found there were 50 feet of oil in the morning following, it would indicate a big well. When he discovered there was actually three times that depth he simply exclaimed 'It is a Cracker Jack'. The experts estimate a yield of from 25 to 50 barrels per day, and that in the event of the flow not exhausting by pumping, of which there are strong indications, the yield will be much greater. In the Albert County district, the company will have ready this month four wells to be shot. One of them is a deep well tapping the tower or third strata of oil sands, of which there is a depth of nearly 200 feet, of richly producing rock of a more porous character than the first or surface sands which are the ones tapped at St. Joseph, and which are not a quarter of the thickness ot the tower sands. It would not surprise those in a position to know if proper shooting in the deep wells producing proportionately, developed a well of 20 times the capacity of the one shot Saturday."

Weekly Record - Fri., Oct. 3, 1902 The Westmorland Oil Fields. - In a recent interview the Hon. H.R. Emmerson, President of the New Brunswick Petroleum Co., said: 'We have as yet but completed the pumping outfit. There is now en route from Pennsylvania the last carload of material. It is due here the last of the week. The car contains tubing for the oil pumps and other material necessary for the fitting up of the several pumps to be run by one power. 'The company now have three drills at work boring in the district of St. Joseph's College, Memramcook and one near the shore of the Petitcodiac river on the Westmorland side, opposite to the Albert County borings. A drill plant derrick is being erected on the height of land between the Memramcook and Petitcodiac rivers - nearly directly west from St. Joseph's College. 'Another plant is being operated in a deep hole on the Albert County side and before the last month the company will have six complete drill plants in full and active operation. 'The company are also negotiating for the purchase of other drill machinery. During the past few weeks they have received some five carloads of the plant and material required in oil developing operations and the work will soon be under full headway as it never was before. The tanks for storage pumps are being completed and soon will be put in place.'"

N.B. Reporter - Oct. 15, 1902 and Weekly Record - Fri., Oct. 17, 1902 The New Brunswick Petroleum Company, Thursday, at St. Joseph's shot well No. 13. Within a few minutes afterwards 68 feet of oil had flowed in and pressure of gas was working. A pipe was put in and a twenty foot flame illuminated the valley. The well is the best struck yet."

Weekly Record - Fri., Oct. 17, 1902 New Brunswick Oil. - The Moncton Transcript of Friday last gives the following graphic description of the St. Joseph oil wells. Favorable reports from the oil wells are a daily occurrence. The New Brunswick Petroleum Company's managers have evidently struck the line of an extensive oil area, and not a miss is recorded in sinking new wells. The most sanguine expectations are realized, but last night marks a red letter epoch in the Company's history. Then came confirmation of a report which had been intimated early in the day. On Thursday morning, oil well No. 13, on the Gaudet farm, near St. Joseph's College, was exploded, and within a few minutes after the explosion the well was sounded and found to measure 68 feet of oil. The suddenness of this inrush and other signs gave indications of locally unusual strength in gas pressure. Last night a pump was sunk in the well, and a twenty-foot torch of natural gas was soon illuminating the district. The blaze could be seen for miles and attracted great attention. It is expected that the company will now be able to run the pumping plant by natural gas fuel and thus effect a considerable saving in the cost of the operation. The sinking of wells will now be rapidly multiplied, and capital undoubtedly forthcoming to rapidly develop the work. The battle against public indifference has been won."

Weekly Record - Fri., Feb. 20, 1903 The Oil Wells at St. Joseph's and Albert Co. are being vigorously developed and one set of the wells at St. Joseph's have been connected with pumping machinery and pumping going on giving good results all through. The owners and chief promoters, are well satisfied with the prospects generally, and next season will see some very prominent development. The company have now 23 wells bored."

Weekly Record - Fri., Feb. 27, 1903 Mr. W.W. Shaw, the well known mining expert for the New Brunswick Petroleum Co., when in Moncton recently said that in the last well No. 18 there were 385 feet of oil. Mr. Shaw thinks this is by far the best well struck yet. Mr. Shaw, who is of a rather reticent nature, said on questioning that the N.B. Petroleum Co., has a bonanza. As stated above, Mr. Shaw is an expert of the first quality. He expects to 'blow' the next well in the course of a few days. Mr. Shaw has been with the Petroleum Co. for upwards of a year, and in that time has achieved wonderful results which have been beyond his utmost expectations."

Codes: P1 / IDX_Names: St. Joseph Oil;

Kings County Record - Aug. 19, 1904 The oil production at Dover West-County, on the N.B. Petroleum Co's works continues to be extremely satisfactory. We note that recently a well was shot by Manager Shaw and he was highly elated over the same, it being the most productive of the 60 or more wells now drilled on the company's works. This enterprise is certainly looking remarkably well and we trust the developments will continue regularly."

Weekly Record - Fri., Jul. 1, 1904 The latest information from the New Brunswick Petroleum Company's oil wells, at St. Joseph's Dover, etc., are very encouraging, steps now being taken to perfect plans, and arrange for the erection of a refinery. It should be a source of satisfaction to all who wish to see the development of the resources of the province made apparent, yet strange to say there are many who openly disavow any belief that there is the slightest foundation for the fact that a producing and paying oil proposition exists at the above points. The work of development however is going on steadily, and by and by, those who are now such unbelievers, will doubtless be the first to join the procession, shouting

Kings County Record - Jul. 8, 1904 We note by an exchange that the first sod of the proposed oil refinery in connection with the New Brunswick Petroleum Co.'s operations was turned on Dominion Day near Memramcook, on land owned by Mr. J.P. Sherry. The construction of tanks will also be started at once. A number of interested stockholders were present, and a portion of the day was spent examining the Company's wells and witnessing the shooting of one of the wells recently drilled. This is evidence that the N.B, Petroleum Company's explorations are not so mythical, as many persons seem to

Kings County Record - Sep. 9, 1904 The right to bore for oil has recently been sublet by the New Brunswick Petroleum Company to a party of capitalists known as the Kent Oil Company. Those interested in the new company include Dr. M.T. Keith, of Harcourt; Dr. Van Hagen, W.M. Townsend and other New York men. The company will bore at Beersville, near the Beersville coal mine, and a rigging is now being erected with a view to commencing boring operations at once. Dr. Keith is president of the new company."

St. Andrews Beacon - Apr. 20, 1905 Matthew Lodge, secretary and manager of the New Brunswick Petroleum Company, has received a cablegram stating that the English syndicate, which is investing half a million in the development of the Memramcook oil fields, has made a preliminary deposit of œ10,000 to bind the bargain."

Kings County Record - Oct. 13, 1905 The annual meeting of the New Brunswick Petroleum Company called for Tuesday was adjourned at the call of the secretary without transacting any business. Among those present to attend the meeting were Senator King, A.D. Richard, Senator Poirier, J. P. Sherry and others."

Kings County Record - Oct. 5, 1906 Mr. M. Lodge, secretary of the N.B. Petroleum Company, arrived home Saturday morning from London, England, where he has been since May last. He returned on the Allan S.S. Tunisian. Mr. Lodge, it is understood, has had a very successful business trip, the nature of which will be stated to an adjourned meeting of the stockholders of the company on Wednesday next. Two experts from England will arrive in the city shortly to visit the oil properties. It is stated that a preliminary contract has been entered into, the details of which will be communicated only to

Codes: P1 / T3 / IDX_Names: St. Joseph Oil; Dover Oil;

Moncton Daily Times - Nov. 11, 1879 Oil in Memramcook. - The parties who have been exploring the wilderness of Dover in search of oil have given up the attempt. A layer of land prevented the further use of their pump. These same gentlemen begin work to-day on the farm of Dominic Gaudet of this place. There is an oil well on this land, a few rods distant from the College. Some twelve or fourteen years ago, a Company worked at this well, but owing to want of funds or other causes, they gave it up. According to the statement of one of the present company, the oil is a superior quality and the indications that there is an abundance of it are very favorable."

Codes: P3 / E2 / IDX_Names: Albert Lime, Phosphate and Brick Company; Oil and Gas - Kings Co.;

Moncton Daily Times - Apr. 12, 1893 The Late Thomas McHenry. - Hillsboro, April 10. - Many of your readers will, perhaps, be quite ignorant of the fact that your paper under the title of the Eastern Advocate had its birth in this village and that Thos. McHenry, who was laid to rest in the burying ground of the R. Catholic church, Albert Mines, on Friday, the 7th inst., was at one time editor. Thomas McHenry was born in Fredericton on May 10th, 1819. His father at that time was a sergeant major in H.M. troop 74th regiment, an Irishman from Antrim and his mother from Dublin, a Miss Carruthers. After his education was completed he entered commercial life, at one time owning and building ships in St. John. In 1854 he commenced a general store in that city and made hardware a specialty. 1863 found him in Salisbury managing an oil business for an English firm whose headquarters on this side of the Atlantic was Boston, Mass. In 1863 he moved to Mary's Point, Albert Co., and promoted the Salisbury and Albert railway association with C.D. Archibald. He used all his efforts by pen and voice to advocate the I.C.R. and confederation. He was a Free Mason. As editor he filled the chair of two other papers besides the one named, the Colonial Empire, published in St. John, and the Christian Visitor. He was thrice married, first to Miss Jerusha Masters of Bath, Maine, of their family, two daughters survive, Mrs. William Irvine, of Brooklyn, N.Y., and Sister Lena McHenry of St. John's Hospital, N.Y. The daughter of Rev. I.E. Bill was the second wife and six daughters are still living, Mrs. Crandall, U.S.; Mrs. William Smith, Ottawa; Mrs. James Gardner, Mass.; Mrs. Benj. Vaughan, St. Martin; Mrs. Trarte, Washington Ter.; Mrs. H.J. Olive, Carleton. What a pity he had not died rich, then his third wife, Miss Margaret O'Connor and her four sons and four daughters would have had the pleasure or reading eulogies, without number, on the checkered life of their father and husband. Jasper Cottage, Demoiselle Creek, was the home of Mr. McH. since he formed the Lime Company, that ascribed all his capital. He began life as an English church man, subsequently joined the Baptist church, and over a year ago was rebaptised and publicly admitted into the fold of the Roman Catholic church at Albert Mines, in company with his friend, Dr. Chandler. He was a most interesting talker, with a memory equalled by few, until impaired by paralysis some months ago."

Chignecto Post - Jan. 31, 1878 Mineral Development in Albert Co.- Perhaps no part of Canada displays a more varied and richer exposure of mineral ores and earths than the little county of Albert. Convulsions of nature in the earlier ages of the earth's history have tossed up the strata in every direction, placing within the reach of man the hidden treasures of the earth. Our readers are familiar with the almost fabulous wealth yielded by the bituminous deposit known as Albertite; with the Albert shales, which, though unproductive at present, will probably form a source ofwealth in the future; with the plaster quarries, which, developed by Messrs. Tompkins, is the leading industry inthe county; with the building stone, manganese and marls,which are all more or less a source of wealth. To these minerals, Albert seemed destined to have two more important additions made through the exertions of Thomas McHenry, Esq. The upheaval of Shepody Mountain has disclosed, according to geologists, the sub-carboniferous formation, the oldest of stratified rocks except the Devonian Series. During the ages when the sub-carboniferous rocks were in process of formation, the following substances were also formed in their order, viz: (1) lime, or carbonate; (2) gypsum, or sulphate; (3) gypsiferous sandstone, (4) salt; (5) bitumen, (6) bituminous shales, (7) Albertite. All these substances, except salt, have been found in the valley of Demoiselle Creek. Mr. McHenry secured some time since a limestone area on the line of railway two miles below the mines, which, from the fact of being thrown up in cliffs, seemed to offer superior facilities for quarrying. Mr. McHenry proposes to have kilns constructed, a grinding mill erected (for which purpose there is a fine water power) and the manufacture of this article on a large scale commenced early next season. Mr. McHenry also proposes to develop a large bedof clay that exists near the Albert Mines on the property of Hugh Steeves, Esq. No. 1 fine clay is imported from England. New Jersey furnishes an inferior article. It is used in fire-bricks, pottery pipes, etc., in making articles to withstand heat. The Albert fire clay has been tested at Brantford, Ont., by Devos at St. John and by potters in New York. Their report is highly encouraging. The position of these properties - their easy accessibility from all parts of the Maritime Provinces - the easy facilities for transportation by land or water - the cheapness with which they can be developed, owing to the abundance of wood and to water power, render them particularly valuable. These mineral resources will not only furnish a traffic for the railway, but will develop a wealth many times the entire cost of the railway. Such resources are a justification for the large expenditure of Government money for railway purposes."

Daily Times - Oct. 6, 1880 Exhibition. - The Geological Department. - On entering the main building the first branch of exhibits that meets the eye is that of mineral deposits found in New Brunswick. Some five glass cases are filled with this class of exhibits, and it is surprising to know what a large number of valuable mineral deposits this Province possesses. Prominent among the exhibits of this class areseveral blocks of Albertite, from the Albert Mines at Hillsboro, the great value of which may be readily seen on comparison with other species of coal. There is also apillar of polished shale, of a species resembling cannel, found at Caledonia, A.C. Besides these there may be seenspecimens of peat, St. John, granular anthracite, foundat Lepreaux Basin, Charlotte, all combustible materials, and silver and lead ores, the latter in many cases being labelled with paper, and a table given showing the relative quantities of valuable minerals to be abstracted from each. Following up the exhibits in this line, but to be found in other parts of the building, should be noticed two large blocks of Spring Hill coal, from the Spring Hill mines in Cumberland County, N.S., each block containing several square feet, and the exhibits of greyand brown freestone, quarried in Albert and Westmorland Counties. There are two separate exhibits of grey freestone and one of brown freestone. Messrs. J.M. Steeves & Co., Albert County, show four specimen blocks of grey stone quarried by them, and the Budro Company, operating at Dorchester, in Westmorland County, show a large block of grey freestone. A. Stevens & Co., whose quarry is situated at Mary's Point, Harvey, A.C., show three blocks of brown freestone, in an unpolished state, merely having the rough edges broken off."

Chignecto Post - Sep. 20, 1894 and Daily Times - Sep. 14, 1894 Mining in Albert County.- The Albert Star says: A meeting of the Baltimore Coal Mining and Railway Company was held at the Beatty Hall on the 5th inst. Bye-laws were passed and other business transacted. The following directors were appointed: Charles Archibald, Glowers Archibald, A.L. Wright, Francis Ritchie, W.F. Wortman, Warren Taylor, and Frederick Steeves. At a meeting of the directors subsequently held the following officers were elected: Charles Archibald, President; Warren Taylor, Vice president; W.F. Wortman, Secretary and A.L. Wright, Treasurer. Clarence H. Dimock, of the Wentworth Gypsum Co.,Windsor, N.S. and J.B. King, of the firm of J.B. King & Co. manufacturers of plaster, New York visited the new plaster quarries, owned by Mr. Dimock at Demoiselle Creek, last week. The plaster from these quarries has been tested and proved a superior quality. A new wharf has been built at Gray's Island, Hillsboro, affording ample shipping facilities. It is rumored that Mr. Dimock will build a plaster mill at the quarries next summer. This new industry, with the rock plaster to be shipped, will add much to the commercial interests of our town. A branch line from the Salisbury & Harvey railway is now being built to the quarries."

Daily Telegraph - Oct. 14, 1874 Albert County. - ... The masonry of the Culvert on Demoiselle Creek, which will be slightly altered in its course, is of the most substantial character, being comprised of large blocks of freestone from the quarry of the Hopewell Quarry Company in the vicinity, the smaller culverts we saw were constructed in like manner. Some of the masons have complained they had not received any pay for four months, and that they were neither able to get away nor pay their board. Plaster. - A short distance above the culvertover the Creek, and about half a mile from the post road, on the left, are enormous deposits of plaster which crops out in solid white cliffs of considerable height along the creek. Some of this plaster is said to be of very fine quality. A short branch line from the railroad will make it available. It is owned by various parties, some portion of the land belonging to the estate of the late Mr. Archibald and some to that of the estate of the late Mr. Howell. ... The hills on the right of this valley abound in free stone, the soil containing large quantities of red marl. Albert mines. - ... The entrance to the mines is up a pleasant ascending road and across a wooden bridge, leaving a row of houses on the right, succeeded by a large engine house and other buildings, above which rises the pit head frame of the new shaft which has lately been sunk at the eastern end of the vein. From this point the road takes a slight turn to the left, and on the summit of the hill, after passing the large general store of Messrs. Willett Bros., we get a view of the situation, which by no means presents the usual grimy appearance of a coal mining district. The place is, in fact, a sort of amphitheatre, hemmed in by wooded rising ground, and is intersected by a deep ravine, in which runs the tramway for the conveyance of the coal to Hillsboro'. On either side the road for a short distance beyond the store are miners houses, after which it runs along the ravine, which is bridged in several places, the most conspicuous object at its western extremity being a large group of irregular wood and stone buildings situated on the rising ground of its right bank, and surmounted by the covered top of a pithead frame and square brick chimney, which points out the principal shaft of the Albert mines. A lofty wooden bridge some sixty feet high runs out from the building, close to the coal shoots for loading the wagons over the track below, which at this point is a perfect net work of switches, for the purpose of depositing coal, a considerable quantity of which lies on the ground. This bridge is connected by an elbow with the opposite bank, where are the office, dwelling houses, stabling, and at a short distance under the hill, in a northwesterly direction, is the cookhouse. In connection with the principal shaft are the engine houses for hoisting and pumping, also a large joiner's and blacksmith's shop. A few hundred yards below this shaft is another dingy group of wooden buildings, also surmounted by the roof of a pit head frame, the smoke issuing beneath which denotes that it is now used as an open-cast shaft for the ventilation of the mine, though as there is still an engine house here, in case of emergency it could still be used for the purpose of hoisting. Almost opposite, across the ravine, and upon the rising ground of the opposite hill, is a very pretty church with a spire, standing out in relief against the autumn foliage of the woods. We have now given the principal features of the scene, and may fill in with miners houses, scattered on both sides of the ravine, vacant pieces of land covered with piles of cordwood, coal, or mining lumber, while here and there rusty iron ventilating shafts rise from the ground apparently without any object except the exhibition of their own ugliness. The Principal Shaft. - There is very little bustle to be seen above ground about the Albert Mines during the working hours, which are only eight, one shift working from 7 a.m. till 3 p.m., and the other from 3 p.m. till 11 p.m. A man or two may be seen standing near a building, but considering there are eighty men employed, one might almost suppose that the coal was extracted by machinery. Crossing the bridge to the principal shaft, we find a comfortable coal fire burning in a movable grate, beneath a spacious chimney. A man stands with his back to the fire, composedly watching the gliding of the wire ""tows"" or cables in and out of the neatly constructed wooden bins, which seems to indulge in the peculiarity of having no bottoms. By and bye a bell vibrates in the engine room at some distance, the ""tows"" slacken their speed, a length or iron chain makes its appearance, and then a square box of coal, which the man pulls on to the bank, wheels a short distance, runs up and attaches an empty one to the tow, which at a given signal rises in the other division. Now a gong, connected by a wire rope with the bottom of the pit, strikes a certain number of blows, indicating what the ascent tow is to be loaded with, long or short timber, tools, slabs, etc., and so on. The shaft is rectangular in form, divided into three compartments, only two of which are visible, the other being in the engine house under the pumping engine, and devoted to the purpose of draining the mine, being furnished with five force pumps at regular intervals, each forcing the water into a cistern above from which it is taken by its successor, the weight of the pump shafts being counteracted by ballast boxes. In the rear of the shaft an old man sits cleaning safety lamps, of which he seems blessed with a never ending supply, and beyond are the drums, on which the flat, oily wire tows are incessantly wound and unwound. Separated by a glass partition is the engine room, where a hundred horse power high pressure horizontal engine incessantly pants and wheezes, sending a ponderous iron bound wooden connecting rod through the wall to the crank on the drums outside. The engineer stands at an iron frame with the reversing gear before him, his left hand on the ""cut-off"" and his feet on the brake, a weight ascending and descending in a slot showing the progress of the tows up and down the shaft. It is very easy in case of accident to stop a descent of the mine, but one instance occurred here 10 years ago, of a man being killed by being hoisted and jammed against the pulley. In the engine room is also a small donkey engine, used for turning a large lathe. In another building on the second story, at the end of a large room, is placed, on a raised platform, the pumping engine, known as a ""Bull engine"" from the name of the inventor. This engine is 400 horsepower, and probably the largest in the Dominion. The cylinder, which alone can be seen, is enclosed in a white hooped casing of brick, and the piston acts vertically directly on the pump shaft, which works the whole five pumps, covering a distance of 1,200 feet, the shaft itself being 1,162 feet deep. The valve gear works in an upright iron frame on the floor below, and is not operated by the engine, but by water, in connection with the pumps by an arrangement known as the ""cataract motion"" by which all jar is prevented. The action of this monarch of the mine is peculiar; after a certain interval of rest he seems to be suddenly seized with spasms, and his valves rattle and jerk, in an alarming manner, until he again sinks into lethargy. The diameter of the cylinder is 62 inches, with a ten feet stroke, raising 50 gallons at each stroke, and in case of necessity, at the rate of 10 strokes per minute, 500 gallons could be raised in that time. Less pumping is requisite in dry weather than wet, the water being principally from the surface, but in case of repairs there is sufficient lodgment room below to drain the mine in ordinary cases. The Principle shaft is about 17 ft by 5 ft. The shaft below, now used as an up-cast shaft, is situated on lower ground, and is 982 feet deep. The third shaft, about a quarter of a mile lower down to the east, is in process of being sunk, and has got down to a depth of 600 feet. Here, as we have already stated, a new engine house has been erected, spacious buildings also covering the pit head, and a large horse gin adjoining. The engine room is very spacious and furnished with a handsome pair of horizontal 40 horsepower engines, the connecting rods of which turn a cogged wheel working into a larger wheel fixed on the axis which carries the drums. The engines are by Messrs. Fleming & Sons, of St. John; the arrangement is compact and ample, being completely under the eye of the engineer, standing in the centre, besides being easily accessible. The boilers are on the basement story, though at present there is only one in place. The shaft here was sunk for the purpose of striking the eastern end of the vein, which was lost for some years by a ""fault"", and was, in fact, only recovered about a couple of months ago, though the works at the shaft were commenced last fall. Near this shaft a wooden air shaft has been constructed some 65 feet high for the purpose of ventilation. It is shortly intended to explore on the west, the workings hitherto being principally between the principal shaft and the new one, a distance of about a quarter of a mile. In this space there have been about 14 levels run though three are only used now. Although the course of the vein is easterly and westerly, it varies considerably from right to left, sometimes coinciding with the strata and sometimes not. Occasionally something like crude petroleum is found on the rocks, and possibly this may be the origin of albertite. Markets. - The market for the albertite is principally in Boston, where it is sold to the gas companies, and was also formerly sold to the Kerosene Works. It is worth about $23 per ton. It is very light, always breaks with a fine polished surface, and has the appearance of jet without its toughness and solidity. Miscellaneous. - The present resident manager of the mine is Mr. Blackar. There is a graded school here, with about 75 pupils, the teacher of the superior department being Mr. J.W. Bishop, the other being presided over by Miss Milton. The mines are also visited by Dr. Lewis once a week. The Union Church, though small, has a very agreeable interior, the walls being oil painted in stone work. At one end there is a gallery for the choir, and it is neatly pewed and painted throughout. The company some time ago offered to furnish a reading room for the use of the miners, but somehow or other the idea does not seem to have been fallen in with, although, perhaps in connection with a ""smoking room"" (an institution we have seen under the roofs of very select and ambitious literary clubs) the advantages of the reading room might come to be appreciated. The company have hitherto been very fortunate. For though there have been some serious fires in the mine, the loss of life from accident since the opening of the mines has been limited to three or four men. This probably arises from the extra care which is requisite in working the mine on account of the gaseous nature of the Albertite, nothing but

Miramichi Gleaner - Sep. 26, 1856 Our Mineral Wealth. - On Friday last the courtesy of the proprietors and Captain of the steamer Relief was extended to all such as desired to visit the recently discovered Coal beds, in the harbour of Musquash; that vessel was placed at their disposal for the purpose of visiting the location. About 100 persons took advantage of the opportunity, and coupling pleasure with business, went down to one of the prettiest harbours in the Province. The day was in all respects propitious, and the party and their pursuits went smoothly as a marriage bell. The table cloth spread on the wilderness by groups of the pleasure seekers, while the more speculative examined with a scientific eye the prospects, and pronounced them good. From what we have seen of the specimens exhibited we have no hesitation in saying the hope is lively, and that the day is not far distant when in that locality wealth to an incalculable extent will be dug from the bowels of the harmless earth, and our unknown resources be brought to light. We hear that a company is to be formed immediately for the developing of that which is now ""deep and darkly hidden,"" and that the shares are placed in so obtainable a position, that the most timid may participate in the ""coming event."" - St. John Chronicle."

St. Andrews Standard - Apr. 14, 1875 Anthracite coal, &c. - It is reported that a valuable discovery has been recently made at Musquash, Parish of Lancaster, of Anthracite Coal, lead and silver. This is important if true, and will no doubt give an impetus to the building of the Grand Southern Railway, as the projected line runs through the land where the vein of coal

S.J. Daily News - Oct. 28, 1876 New Coal Discovery. - About twenty-six miles to the Westward of St. John on the Bay of Fundy coast, is a small settlement called Mace's Bay. The settlers in this somewhat out-of-the-way place have for years been curious concerning some black ledges that cropped out on the shore of a small inlet known as the Basin. Geologists of repute had their attention called to it years ago and pronounced the deposit a soft, black slate, and nothing in it. People who owned property in that neighborhood were not satisfied with the decision of the professors, and continues to believe that a bed of hard or some kind of coal must be in the vicinity of so much material, that, but so far as color was concerned, ought to be its own mother. The old adage, that time works wonders, was exemplified in this case. Nothing daunted, the owners of the property have persisted in their belief, and have dug and delved, and they found the deeper they got the better the material appeared - the more it looked like black diamonds - until they found it would not burn. They then set to work and managed to sink a shaft; they got down ninety five feet. At this distance their faith and perseverance was rewarded by striking a fine vein of the real stuff. They got through four feet. How much thicker the vein is is not known at present, owing to the falling in of their temporary work. The professors have again come to the front and are of the opinion that the whole county is underlaid with a bed of the very best anthracite coal. It burns more readily than Pennsylvania."

St. Croix Courier - Aug. 2, 1877 Pure Anthracite Coal in Charlotte Co.- The St. John Globe announces the existence in apparently unlimited quantities of anthracite coal in the neighborhood of Point Lepreaux. A company is at work; a shaft more than a hundred feet deep has been sunk, and everything bids fair for the development of this most important industry. Charlotte County is apparently destined to be the source from which the future supply of anthracite for the Dominion will be drawn. The coal when burning has all the qualities of the ordinary Pennsylvania Anthracite, having a light blue flame and burning very freely in an ordinary grate. Its heat giving qualities are large, and it leaves a regular ash. When first kindled the odor of sulphur marked the presence of pyrites, but it soon passes away. This is due to the fact that the samples burnt were taken from the upper surface of the seam and from a close proximity to the crushed coal. There is no doubt but that this will not be apparent in coal from the heart of the seam."

Codes: R8 / IDX_Names: Dipper Harbor/ Lepreau Coal;

Daily Telegraph - Aug. 4, 1877 Visit to Lepreaux Mines. - Sir, - On Wednesday a small party left harbor in the Effort to visit the Hanson Mine near Lepreaux. The day was lovely and the steam yacht gave the company the full benefit of the sea. She pegged away as if she meant to be in a hurry, but made slow progress. No breeze stirred the surface of the bay, and certainly none filled the sails which were hoisted to invite its aid, For lazy people it was a delicious time, as the yacht herself made a five knot breeze, just enough to pass away the sweltering heat which troubled folks on shore. What the vessel lacked in speed she made up in comfort and in cheer and many a hearty laugh I am sure must have startled the dreamy echoes as we passed along beetling brow and wave worn rocks. At midday the very lighthouse turned out its population to see our noble steamer walking the waters as a thing of life and steaming majestically with her short snout the stomach trying tide of Lepreaux. We almost cut a swell, for the union jack with the Dominion splatch upon it run up to the lighthouse top. Of the four who rushed from the building to witness the sight none was so demonstrative as the large Newfoundlander who bounded to and from and barked his delight at the show. In good blaze we reached our destination and as we approached our wharf through the winding channel of the harbour our attention was called to a mass of black earth which lay piled upon the shore, amd marked the Big Find, or whatever name this New Brunswick mine may be called. As soon as we landed we were led to a shanty (about equal to some now springing up in our city) where a small round stove added to the heat in the open house. On opening the door of the stove a fire of apparent anthracite was burning brightly. I do not speak scientifically but only of appearances. That there might be no deception a fresh supply of the black material was thrown into the stove and the door closed. In twenty minutes the fire again was bright and shortly the added mass as clear as any anthracite could be. Thus in an inferior stove, and with a moderate draft, the carbonaceous substance taken from the pit, gave a fire as bright and hot as any anthracite. The shaft has been sunk 120 feet, and the seam at that depth has widened to 16 feet. The appearance and hardness of the mass is like that of the Scranton mine, and like it will probably become less friable and better adapted for handling. Am American is now developing this New Brunswick property, the value of which should be carefully tested. Before leaving we had three barrels put on board and two were used to help us steam back to town. The night was lovely and as twilight deepened, the evening hour was pleasantly passed with songs which under such conditions partake of the sentimental. It may be, because the brain active all day naturally drops into the dreamy quietness of rest; and like the flowers exhale its sweetness as the daylight passes. I will not say what hour we reached our homes. I have my suspicion that some of the delay arose from one or two of our number who preferred being rocked on the cradle of the deep to seeking the cradle at our house and home. Prospector."

Daily Telegraph - Aug. 8, 1877 and St. Croix Courier - Aug. 16, 1877 New Brunswick Anthracite Coal. - A trial of the coal recently discovered at Mace's Bay, was made yesterday in the Bolt and Washer Factory of Mr. Levi H. Young, Waterloo street. The test was purely practical and established the fact that in heating and clear-burning qualities, the samples in question were equal to any American anthracite brought to this city. Its appearance in the furnace was identical with that of first class anthracite and Mr. Young expressed himself fully satisfied with it in every way. The proprietors of the find are having the coal put to a series of tests to ascertain its smelting and steam generating value as compared with other hard coals and positively assert that it is nothing more nor less than genuine anthracite."

Daily Telegraph - Aug. 27, 1877 Lepreaux coal mine. - Prof. John C. Karston, general superintendent of the Giberg Silver Mining Company of Newburyport, Mass., has been on a visit to the Lepreaux coal mine, for the purpose of reporting upon the value of the deposit of coal. His examination extended over three days, and he thinks the discovery is a valuable one. He returns to his home in Alburtis, Pa., today."

Codes: R8 / IDX_Names: Dipper Harbor/ Lepreau Coal;
Daily Telegraph - Sep. 5, 1877 Lepreaux Coal Mine. - Reports on the Coal Taken From Deposits. - We publish, today, reports on the Lepreaux mine coal from Levi H. Young, Andrew Taylor, chief engineer of the International Steamer New York; and Prof. John C. Karsten, now general superintendent of the Gilberg Silver Mining Co., and formerly superintendent of the Schuylkill Coal Mining Co., of Pennsylvania. Report of Levi H. Young on Anthracite Coal. -Mr. Hugh R. Robertson, manager of the coal mine at Mace's Bay, requested me to make a trial of some of the coal taken from that mine. Having sent a barrel of the same to my factory, on Waterloo street, on Wednesday, 7th August, I tested the same in regard to its qualities as a welding and forging coal. A fire was started in the bolt furnace, a small quantity of wood was first lighted and several large pieces of this coal placed upon it; with a gentle draft it kindled readily, and when in full blast it gave proof of its clear burning qualities. Several bars of iron bolts, &c., thrust into the furnace, were brought to a white heat, in scarcely more time than it would take the Lehigh coal to accomplish the same thing. A decided proof of its heating capacity was noticeable, in the fact that after the fire was well under way, and had increased in size, it began to melt the cast iron front of the furnace, and the drip of the melted iron could be easily distinguished, as it descended into the ashes. Another quality, worthy of remark, was its durability; the fire was kindled about 4 o'clock, p.m., and after burning with a forced draft for nearly two hours, was allowed to die down; at 5 o'clock the next morning the smouldering ashes were again forced into a flame, by bringing the draft to bear upon them, and this after an intermission of twelve hours. The coal left considerable ashes, mixed with a brownish red clinker. In conclusion I would state, that I was much surprised that the coal sent me evinced such remarkable qualities, for its appearance was very much against it, it being softer than the usual Anthracite and more easily broken. The most of the lumps, however, had that bright appearance which characterizes that kind of coal. Mr. Robertson wished me to understand that he did not offer this coal as a final sample of the mine, but merely as a sample of the coal taken from the shaft that he is sinking down to the coal basin. He is sanguine of reaching a harder and better article, when the shaft has been sunk to a depth of 300 or 400 feet. If he does so, he will have a coal unsurpassed by any; as these imperfect samples have given a wonderful performance, giving more heat than any coal I have ever used. L.H. Young. ------------ Report of Andrew Taylor, Chief Engineer of I.S.S. Co. Steamer New York on the anthracite coal taken from the prospecting shaft at Mace's Bay. - Messrs. Robertson & Hanson, proprietors of the coal measures at Mace's Bay, having sent about one and a half tons of coal taken therefrom on board the steamer New York of the I.S.S.
